"CLEVELAND" STOPE DRILLS

EFFICIENCY:—Of course you want the stope drill which has the highest efficiency, but you must pick out the one that will have as high an efficiency a year from to-day. Isn't it true that your stope drills decrease steadily in efficiency as they grow older?

REPAIRS:—Repairs which must be made from time to time after the part has given long and satisfactory service, are not a source of dissatisfaction, but dont you find that your stope drills are constantly needing something new?

DRILLING CAPACITY:—As long as your stope drill will put in sufficient holes per shift to drill up your stope there is no argument in favor of your changing to our drill just becanse it will drill faster. We know that. But we know that the "CLEVELAND" Stope Drill will do as much work per shift when it is one year old as it will when one week old, and that is what you want, isn't it?

THE "CLEVELAND" Whether you purchase your stope drills after considering efficiency, repair cost, or drilling capacity, the "Cleveland" should be tne stope drill you specify, for its design is such that the initial efficiency is the highest possible in an air tool, and the piston and valve action are so related that the "Cleveland" is just as efficient when it is a year old as when it is brand new; we **know**, and our information is gained from hundreds of installations that the "CLEVELAND" will cost less for repairs **per year** than any stope drill made; a 30 day trial will convince you that the "CLEVELAND" will drill as much per shift as any other stope drill, and we have machines always in stock ready to ship for trial if you will drop us a line, As you have everything to gain and nothing to lose, why not investigate NOW?

New Sullivan Air Compressors

Steam, "WA 4" Belt "WG 4"

Mining Companies will find these two new small Sullivan Compressors desirable on account of their ability to give continuous "year in, year out" service.

These machines are simple and plain in design, but in proportion to size, they are stronger and more durable than large "heavy-duty" compressors.

Efficiency-making details have not been omitted.

BEST FOR MINE BUILDINGS

Amatite has a genuine mineral surface.
This means that it requires no painting.
Contrast this with the fact that all ready roofings of smooth surface require painting regularly.
Figure out how much it costs you to paint the roofs of your mill, your shaft-house, repair shop and the other buildings?
Think of saving this amount not once—but three, four or five times—smooth-surfaced roofing requiring painting about every other year.
Amatite does not require any attention whatever after it is once laid.
Another point that recommends it to the Mine Manager is that it is easily laid and has galvanized nails and liquid cement in the center of each roll.
We can offer no more convincing argument in favor of Amatite than a sample of the roofing itself. The practical man recognizes its value immediately—its thickness, strength and durability.
We also have a booklet of facts. **Send your request for this free sample to the nearest office.**

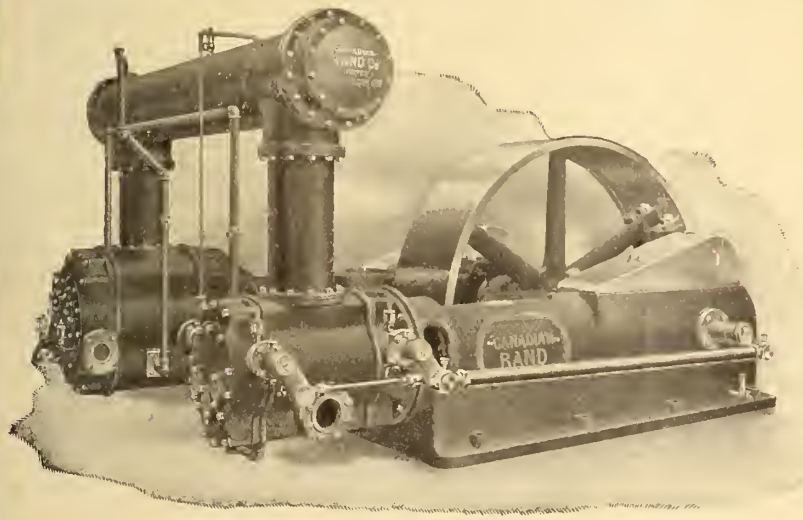
VANCOUVER ST. JOHN, N.B. HALIFAX, N.S.

CLASS "RP-2" AIR COMPRESSORS



The Rand Class "RP-2." Duplex Power Driven Air Compressor combines the good principles of modern engine design with the best pneumatic practice.

The unusual capacity of Class "RP-2" Compressors is of course evolved through their high speed and high efficiency, but their massive enclosed dust-proof construction permits of high-speed without impairing the "Rand" reliability.

The superior quality of workmanship, rigid enclosed construction, exceptionally large bearing areas and efficient lubricating system which literally "floods" all important bearings, combine to give the high mechanical efficiency which characterizes this type.

Large free air ports, correctly controlled by improved Corliss Inlet Valves and "Imperial Cushioned High Speed Outlet Valves" insure highest compression efficiency.

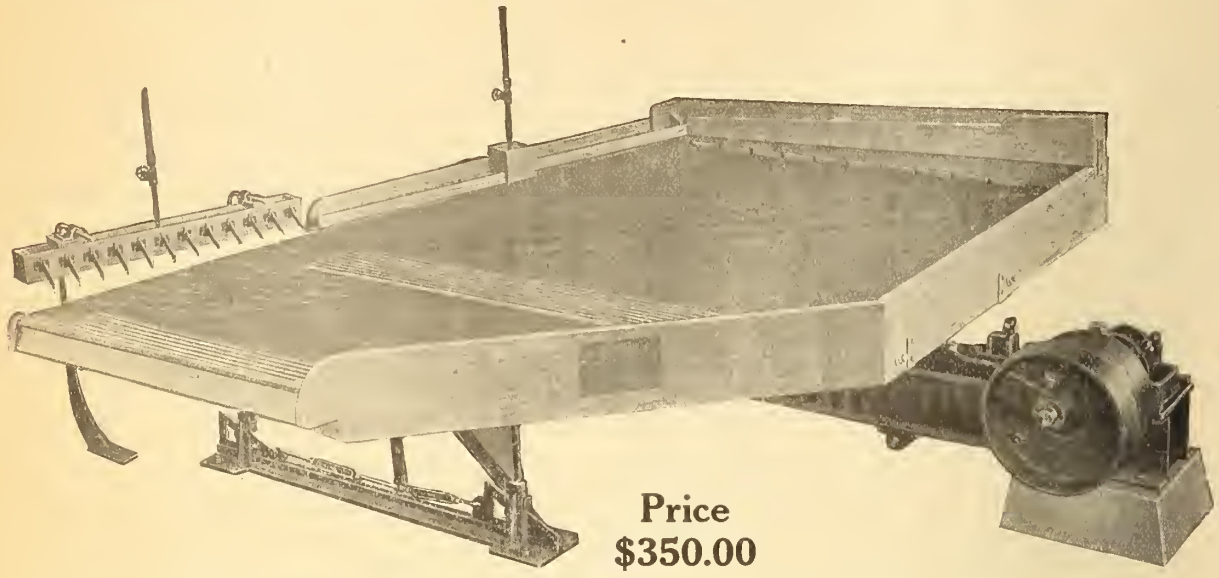
Another Victory for the "DEISTER"



Price $350.00

We are placing 180 Improved No. 3 Deister Slime Tables and 132 No. 2 Deister Sand Tables in the Miami Copper Company's mill, Miami, Arizona. This large order was the direct result of the showing made by the Deister Tables. The No. 2 Deister competing against all of the well-known makes of tables on the market—The Improved No. 3 Deister competing against vanners.

By eliminating teeth in the roller and rocker arm, our driving mechanism is now the most effective, noiseless and durable on the market.

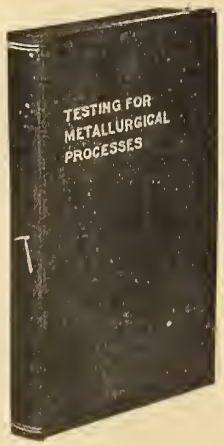
Testing for Metallurgical Processes

By JAMES A. BARR

216 pages
Illustrated
Indexed

$2 POSTPAID



This book is designed to assist in the selection of the process of treatment for any ore. The author describes the apparatus employed in making laboratory and small-lot tests. It is founded upon experimental work at the Michigan College of Mines, and the methods recommended have been tested in practice. It is brief and practical, equally valuable to the student and the practicing engineer.

Why the C.P.R. North Toronto Route to Ottawa and Montreal is the Logical One

The train leaves as follows:

Leave North Parkdale - - -	9.15 p.m.	Leave West Toronto - - - -	9.30 p.m.
Arrive North Toronto - - -	9.40 p.m.	Leave North Toronto - - -	10.00 p.m.
Arrive Ottawa, 6.50 a.m.		Arrive Montreal, 7.00 a.m.	

Daily except Sunday.

¶ The residents of Toronto are adjacent to either North Parkdale, West Toronto or North Toronto stations, same being easily accessible and closer to residential districts.

¶ The North Toronto route is over an hour faster and overcomes a long hill climb for the train obviating any inconvenience and ensuring early arrival at Montreal and Ottawa.

¶ The roadbed has been improved till it is unexcelled in Canada. Practically half the line is double tracked.

¶ The equipment is "Canadian Pacific Standard," a synonym for the "best" and attentive porters, non-obsequious, ensure efficient service.

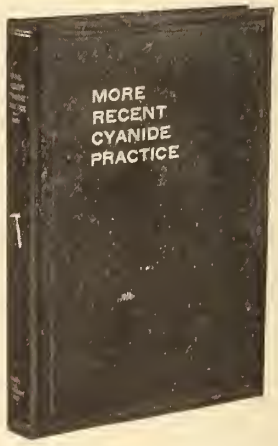
THE EXPERIENCE OF EXPERTS



More Recent Cyanide Practice

EDITED BY

H. FOSTER BAIN

424 Pages Indexed Illustrated

$2 POSTPAID

There is no information so valuable as the experience of the men who have designed, built, and operated notable mills, or the chemists and metallurgists who have solved difficult problems as they arose. This book contains articles by 82 men, among whom are the leaders in the cyanide industry. It is valuable as a handbook and together with the companion volume, 'Recent Cyanide Practice', makes an interesting compendium of the cyanide process.

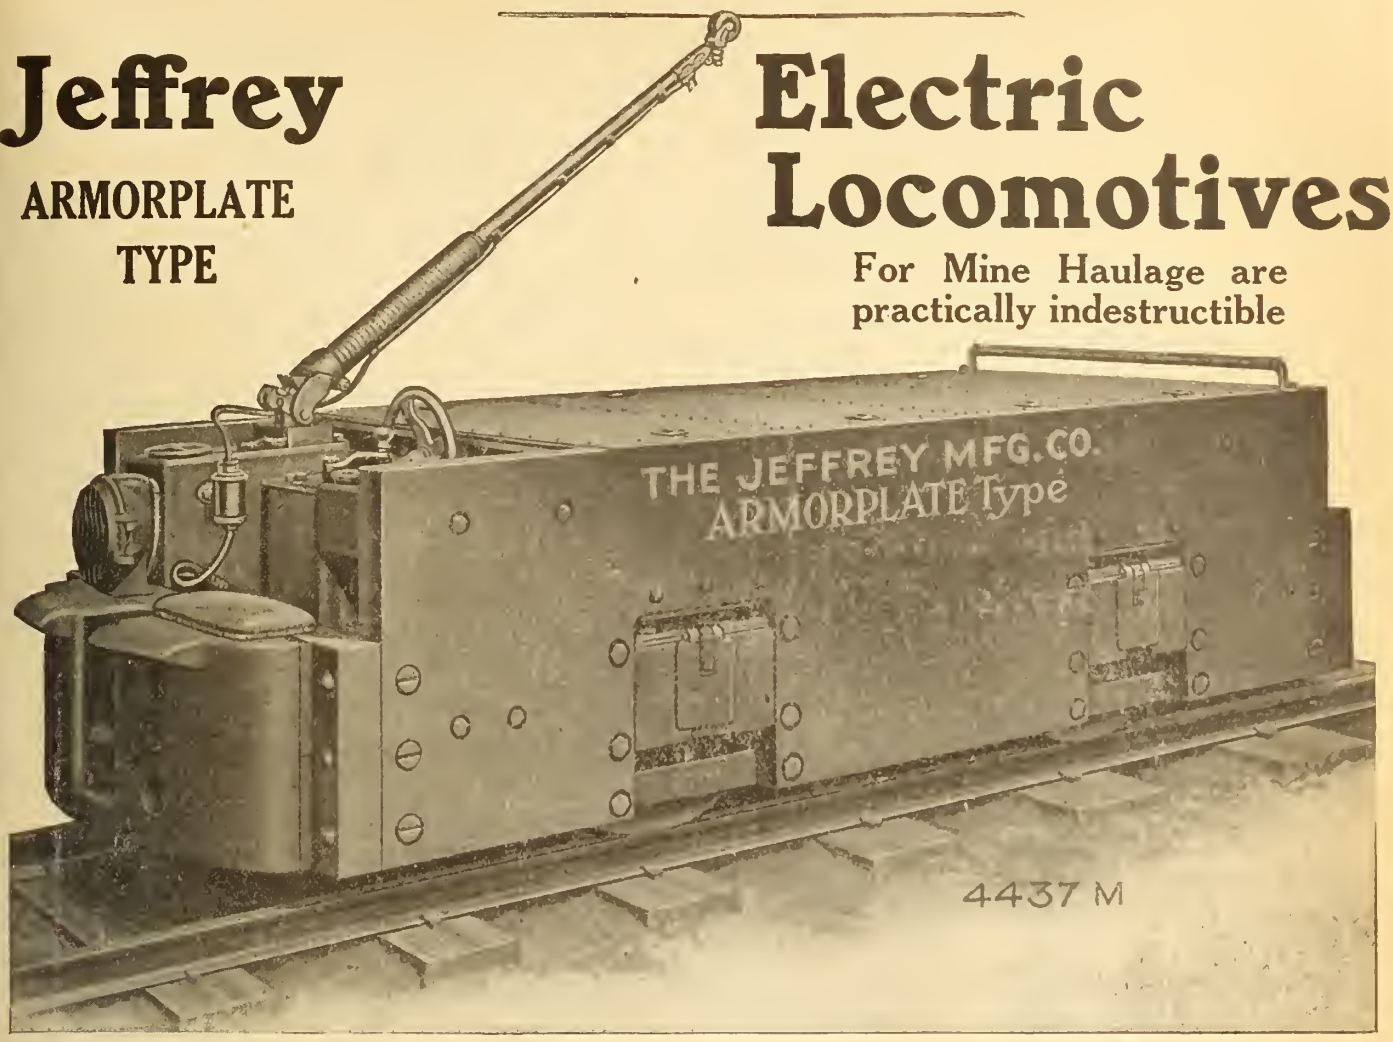
Jeffrey
ARMORPLATE TYPE

Electric Locomotives
For Mine Haulage are practically indestructible



THEY are designed and built to withstand the most severe service encountered in underground or surface haulage.

Frequent accidents impose severe conditions upon Mine Locomotives. You may have had the experience of "head on collisions," or Locomotives jumping the track and striking the rib. The results are invariably disastrous.

The sides and ends of these Locomotives are built of special solid steel plates securely bolted together, forming tremendous rigidity in the frames, as well as providing absolute security for the mechanical equipment.

Write for additional data

We design and build complete equipments for Coal Mines, Tipples and Washeries including Coal Cutters, Drills, Car Hauls, Elevators, Conveyers, Screens, Crushers, etc.

THE CANADIAN MINING JOURNAL

VOL. XXXII. TORONTO, Jan. 1, 1911 No. 1

The Canadian Mining Journal

With which is incorporated the
"CANADIAN MINING REVIEW"
Devoted to Mining, Metallurgy and Allied Industries in Canada

Published fortnightly by the
MINES PUBLISHING CO., LIMITED

Head Office - - Confederation Life Building, Toronto
Branch Offices Montreal, Halifax, Victoria, and London, Eng.
London Office . . Walter R. Skinner, 11-12 Clement's Lane, London, E.C.

Editor:
J. C. MURRAY, B.A., B.Sc.

SUBSCRIPTIONS—Payable in advance, $2.00 a year of 24 numbers, including postage in Canada. In all other countries, including postage, $3.00 a year.

Advertising copy should reach the Toronto Office by the 8th, for the issues of the 15th of each month, and by the 23rd for the issues of the first of the following month. If proof is required, the copy should be sent so that the accepted proof will reach the Toronto Office by the above dates.

CIRCULATION.

THE YEAR 1910.
A Review.

Twelve months ago to-day we ventured to predict a prosperous year for the mining industry of Canada. The year 1910 has come and gone, and with it came much profitable growth. and much encouragement for the future. Our confidence in Canada's ability to take a leading place amongst mineral producing nations has been strengthened. Every year brings us a substantial step nearer our goal of self-reliant nationhood. The chief industrial foundation-stone of that nationhood is the possession and proper use of varied mineral wealth. Although the mining industry has not yet received from our law makers and from our great transportation corporations the recognition that is its due, yet that recognition is measurably greater to-day than it was a year ago.

The pressing need of codifying the heterogeneous mass of mining laws that now encumbers us, has been taken in hand. For this advance, the executive officers of the Canadian Mining Institute are to be thanked. The Federal Government, also, has shown enlightenment in giving moral support and financial assistance to the movement. We pray that before another year has passed, the way shall have been cleared for the enactment of mining laws that will supersede the present anomalous and conflicting Federal and Provincial Acts, and that will insure fair treatment for the investor.

While, since our last annual review, we have witnessed a distinct change for the better in the attitude of our law makers towards mining, there is still little or no amelioration of transportation conditions. Our railway corporations are blind to the needs of the industry, and, consequently, blind to their own best interests. Carriage of low grade ores is unbelievably costly. Coal freight rates, more especially in the west, are not based upon a rational schedule, but are fixed at the highest possible figure that consumers will pay. In one instance in the east, an iniquitous freight rate is charged by a company owning a coal mine and operating its own railway. The high rate shuts a competing mine out of a part of its legitimate market. Many such instances could be adduced. Such commodities as talc, gypsum, pyrites, iron ore, ores of the precious metals, etc., etc., provide opportunities for like exactions. One reason for this situation is that what protests are made come from individual operators, and not from the mining fraternity as a whole. However, an increasingly effective "big stick" is at the disposal of the public; we refer to the Board of Railway Commissioners. This tribunal has rendered many decisions that bear directly upon the transportation of minerals

and mineral products. Several of its decisions, notably one in which the White Pass and Yukon Railway Company was involved, gave immediate relief to mines that had been struggling under the incubus of prohibitively high freight charges. Well-founded grievances will receive prompt consideration from the Board. These grievances exist; and many more should be laid before the Commissioners at once. The fact that nearly all our railways are amenable to the decisions of the Board appears not to be fully appreciated by mine operators.

Standing in bold relief among the official acts of the Federal Department of Mines is the belated, though welcome interest evinced in colliery rescue and salvage work. A much better start has been made in controlling the manufacture and use of explosives. Both of these official efforts will be absolutely wasted unless a simultaneous attempt be made to improve and standardize mine inspection. This, of course, refers especially to coal-mining. And in the Province of Alberta the Federal Government is responsible for a regrettable state of affairs. As at present the Dominion receives all the fees and royalties, and as inspection and salvage are left to the province, it is not to be wondered at that slackness obtains. In view of the recent loss of more than a score of lives in an Albertan colliery, the Government will be chargeable with criminal negligence if provision for modern inspection and salvage be not made without delay. This is absolutely the most vital question confronting the Federal Department of Mines, primarily because it involves the problem of saving human lives, and secondarily because it involves the prevention of enormous loss by underground fires. And the whole value of any measures adopted will depend upon those measures being complete. Rescue stations are of little use if inspection is not efficient and frequent. Prevention in the mine is not to be neglected merely because emergencies apparatus is installed above ground. Briefly, while the Federal Government's action in investigating explosives and in encouraging the use of rescue apparatus is most praiseworthy, it will lose significance unless it is rounded out in the directions alluded to above.

We have dwelt upon mining legislation, the relation of transportation to mining, and the duty of the Federal Government from a humanitarian point of view, because these three features command the interest of all concerned in the industry. While part of our remarks may not be directly pertinent to an annual review, yet there could be no more suitable time than the present for impressing our readers.

Without further delay let us glance at the mining progress made in each Province during 1910.

Nova Scotia.—Much has transpired in Nova Scotia during the past year. The event of greatest moment in mining circles was the amalgamation of those two great protagonists in the legal battle of two years ago, the Dominion Coal Company and the Dominion Iron and Steel Company. This union is already bearing fruit. Under the general management of Mr. M. J. Butler, formerly Deputy-Minister of Railways and Canals, a policy of expansion has been adopted. The recent acquisition of the Springhill collieries is the first important step. More details of the vast plan will come to light during 1911.

The coal outputs of the Dominion collieries have increased by nearly a million tons as compared with the previous year. The Nova Scotia Steel and Coal Company has shipped nearly thirty-five thousand tons more than during 1909. In fact, all but two of the collieries appear to have produced larger quantities of coal than ever before. The year, therefore, has been marked by progress in coal mining.

The output of pig iron and steel products also shows a pleasing enlargement. This was to be expected. At very few places in the world are fuel, ore, and flux assembled so cheaply as at the industrial ports of Cape Breton. At few places also are operating costs so carefully controlled.

Most helpful to coal mining has been the utter rout of the United Mine Workers of America. The men and methods employed by this foreign organization were unworthy of respect and unsuited to a country where civilized habits of thought and decent systems of government prevail.

The recent anti-reciprocity movement amongst the coal operators of the province was badly conceived and unskillfully executed. Whilst the opponents of reciprocal free trade with the United States in coal have strong cause to fear the removal of the present tariff, they have not yet succeeded in stating their case in a way that might appeal to the judicial mind. However, the question is a live one, and no doubt more will be heard of it presently.

Although, apparently, there has been more activity in gold mining during 1910 than throughout 1909, yet the total production will be slightly lower. The cause of this will be discussed at a later date. Suffice it to say that part of the work done during the past year will not bear fruit until well on in the coming year.

The output of gypsum will probably be larger than previously. Slowly, though surely, the idea of manufacturing plaster in Nova Scotia is gaining ground. Infusorial earth is again being worked and prepared for market. This enterprise, in which there are substantial profits, was dormant for some years. The quarrying of building and monumental stone shows little change.

The new tungsten district near Moose River, Halifax County, is being quietly and sanely developed. Everything indicates that a high grade ore will be obtainable in sufficient quantity to meet any probable demand for a long time to come.

In the main, Nova Scotia has improved her position as a mineral producer.

New Brunswick.—This Province continues loitering by the way. The Bathurst iron ore deposits are being rapidly exploited by the Canada Iron Corporation. No doubt these will become the backbone of a large industry. The quarrying of gypsum and limestone continues on about the same small scale as heretofore. The recently resuscitated antimony mine is apparently abandoned.

The outlook is brightened, however, by the successful development of the gas and oil region in the vicinity of Bathurst, and by the promised opening up of the extensive oil-shale deposits in the same region. The rumoured discovery of tungsten ore has not yet been corroborated.

Amongst the mineral possibilities of New Brunswick are copper, nickel, and manganese. None of these has been systematically examined. The Provincial Government is lamentably inert.

Quebec.—Inspired by the good fortune of her neighbour to the west, Quebec has bestirred herself to good effect. The appointment of a strong Commission to report upon the mining potentialities of the Chibougamau country, and the revision of the mining laws, were but an earnest of more radical improvements in the future. The Government's wisdom in selecting Mr. Theo. Denis for the post of Superintendent of Mines needs no further proof than the fact that he was the active cause of both the steps mentioned above. Incidentally, nothing has as yet been divulged officially as to the result of Chibougamau commission.

The principal mining industry of Quebec is, of course, asbestos mining. On January 1st, 1910, the aggregate capitalization of asbestos companies operating in the Province was reported to be more than thirty-five million dollars. The gross earning capacity of these companies at the same date was less than two and one-half million dollars. Mr. Denis, Superintendent of Mines, refers on another page in this issue to the overproduction that marked the past year. We are pleased to notice that he also alludes to the excellent condition of mines and mills, and that he expresses the conviction that, judging by the past, the present depression is only temporary. "From an annual production of a few tons thirty years ago," writes Mr. Denis, "the industry has grown to 65,000 tons, or more, and no one doubts that in a few months matters will have re-adjusted themselves, and the steady development will continue. On a smaller scale this has happened before, and periods of over-production and consequent depressions have been followed by periods of healthy growth."

The Weedon copper mine is a new producer. This is situated in Weedon Township. The Eustis copper mine has been a steady producer. Copper is being saved here from the mine water by precipitation with scrap iron. Copper mining, with the exception of these two mines, is not particularly active, although more prospecting is being done than heretofore.

The investigation of the alluvial gold deposits of Beauce County is the principal activity so far as this precious metal is concerned. A Montreal syndicate has obtained encouraging results and will commence operations next spring.

Graphite mining is looking up. The recent reorganization of the Buckingham Graphite Company,

Chrome ore mining has made no advance during the year. The mines and mills have been idle. The mica industry, also, has been sluggish. What orders are placed were filled from stock in hand. Iron ore mining, also, has preserved the even tenor of its way, the only room for expansion being limited by the investigation of titaniferous iron ores. The outputs of magnesite and of building material have increased.

Altogether the mineral products of the Province of Quebec have been augmented in value during 1910. During 1911 there should be an enlargement in the production of iron ore, copper ore, and asbestos.

Ontario.—The Province of Ontario has enjoyed a most prosperous year. Cobalt has more than held its own. This year's output of silver will probably exceed that of 1909 by twenty to twenty-five per cent. And Porcupine, appearing on the horizon at the psychological moment, has been accorded a better chance of rapid development than any other Ontario gold camp has ever had.

In Eastern Ontario much unobstrusive advance has been recorded. The introduction of cheap hydro-electric power has infused new life into several districts. Iron mining is active. Several old gold mines are being reopened. The production of talc is growing rapidly. Decorative marble, also, is being successfully quarried.

The output of nickel and copper from the Sudbury region has exceeded that of former years. The silver mines of Thunder Bay have been practically idle; but persistent efforts have been made to revivify several of the gold mines in the Lake of the Woods district.

The blast-furnaces of Ontario have had a busy year. Whilst the number of working iron mines is still very small, the outputs are increasing. The removal of the bounty does not appear to have affected the industry materially.

The yield of oil from Southeastern Ontario has continued to fall off, whilst the yield of natural gas has been larger than ever before.

In nearly all directions the mineral industries of Ontario have waxed stronger during 1910. The year has been marked by the continued utilization of natural water powers.

Alberta.—Alberta's output of coal for 1910 will exceed that of 1909 by a considerable amount. Many new coal prospects have been opened, and large areas have been staked in the western sections of the province. European, Canadian and American capital is flowing in. There is no doubt that Alberta will rapidly forge ahead in coal mining.

The snuffing out of twenty-four lives at the Bellevue colliery of the West Canada Coal Company marred the closing month of the year.

Closer and more efficient inspection of collieries is an absolute necessity in Alberta, as also is the removal of the administration of mining lands from the Department of the Interior at Ottawa.

British Columbia.—The annual returns of mineral production will show a fair net gain for British Columbia throughout 1910. and this, despite a falling off in lead, copper, and zinc. Serious fires checked the production of all three metals. In the case of copper, also, revision of the estimates made by the provincial mineralogist, which were based on assays of the ore instead of on actual smelter returns, contributed to pull down the annual total.

Gold, silver and coal were produced in larger quantities than those recorded for 1909. The outputs of coal from Vancouver Island and from Crow's Nest Pass were much enlarged.

The Portland Canal mining excitement subsided early in the summer. In some respects the district has been disappointing, but several genuinely encouraging mines are being worked by the best type of operators.

More attention is being paid to the Queen Charlotte Islands. Indeed, the west coast bids fair to grow into a very important mining region.

The Sheep Creek gold district has been the centre of sound work, and, incidentally, of some unnecessary stock manipulation.

Taken as a whole, the mining industry of British Columbia was never in healthier condition. The foundations are well laid for pronounced expansion in the future.

Yukon.—News from Yukon has not been plentiful this summer.. It is evident, however, that the gold output has been larger than that of 1909. Quartz mining, also, has been conducted on a small scale. More will be heard of this branch of the industry.

GENERAL.

Technical Education.—The appointment of the Commission on Technical Education was, amongst the import events of the year. That commission has held sessions in several mining towns, and in its final report will be much matter relating to mining education. As noted last year, New Brunswick is now the only province that has made no adequate provision for the technical training of the rising generation.

Conservation of Natural Resources.—The Federal Conservation Commission has been carrying on a campaign of useful publicity. The unfortunate incidents that marked the Commission's first attempt to deal with mining problems have been practically forgotten. There is little danger of a repetition.

The fact that the mining engineer has always applied the principle of conservation has been overlooked.

There is, of course, a notable mission for the Commission to perform. So far as it educates the public up to the ideals of conservation, it is doing a noble work. But more pains should be taken to consult with leading mining men, and to secure the sympathy of the whole mining fraternity.

Legislation.—As pointed out above, mining legislation is engaging the full attention of a strong committee of the Canadian Mining Institute, acting in collaboration with the authorities at Ottawa. Progress has been made and it is hoped that before the year is over a draft of new mining statutes will have been completed.

In each of the provinces minor changes have been made in the mining laws. The changes and improvements in the Quebec law have been the most radical.

Departmental.—Both the Geological Survey and the Mines Branch have done good service for the country at large. The Survey is getting closer to the actual needs of the country. Its system of periodical press bulletins has been resumed. The Mines Branch, although showing a tendency to dissipate its energy on labours that are only of remote value to the country, has taken hold of problems touching the use and handling of explosives, and the introduction of breathing apparatus in coal mining centres. Both branches need larger appropriations.

The Provincial Mines Departments of Nova Scotia, Quebec, Ontario, and British Columbia have been vigorous. Particular mention is due the British Columbia Department for the excellence of its reports. The Ontario Bureau of Mines is also to be commended in this respect.

Canadian Mining Institute.—The membership of the Institute has been added to considerably during 1910. West of Montreal the different branches are active. In Nova Scotia a branch is needed badly, as the Mining Society of that province shows no signs of life.

Generally, whilst the Institute has had none but local meetings since the annual dinner, it is quietly progressive, and is taking a leading part in the formulation of legislation.

There is to be no stir over the annual elections. For this we are sorry. An occasional difference of opinion is by no means an unmixed evil.

The Profession.—That the profession of mining engineering is playing a larger part in Canada is evidenced by the fact that never before have so many investors sought technical advice. Both Portland Canal and Porcupine are shining illustrations of this fact. Had it not been for the mining engineer, Porcupine would have been swamped with every variety of unmitigated fraud. We believe that the mining engineer is at last in a fair way to gain proper recognition.

* * *

For Canada and, quite incidentally, for ourselves the year 1910 has been a year of peace and prosperity. To all our readers we beg to extend the compliments of the season. May the New Year bring nothing but peace, progress, and profit!

RECIPROCITY IN COAL.

In our issue of November 15th there appeared an editorial upon the same vital subject that gives title to this. The former editorial has aroused the Maritime

Mining Record, Stellarton, N.S. It may be explained that the Record is a fortnightly that represents the coal mining interests of the Province. It is an open and perfervid opponent of reciprocity.

The Record's remarks concerning ourselves we shall willingly overlook. It has permitted its keen partizanship to cloud its judgment. In so far, however, as the Record represents eastern opinion, the opinion, at least of those who control the coal mining industry, and of a greater proportion of those whose livelihood depends upon that industry, it is entitled to a full hearing. Incidentally, discretion bids us have a care. The editor of the Record, a well-seasoned veteran, survivor of innumerable inky encounters, is not lightly to be challenged.

Apart, however, from the perilous pen of our maritime brother, we are deterred from entering into a war of words. This would only befog the real issue. That issue needs unbiased statement. The object of our former editorial was to emphasize this point.

We can assure the Record and the eastern operators that the CANADIAN MINING JOURNAL is strictly non-partizan. The reasonable claims of both the east and the west will have our instant support. But neither will find us a special advocate.

In more than one statement the Record is in error. For instance, when it asserts that we favour reciprocity, it is labouring under a complete eclipse of mental vision. The assertion, also, that the desire for reciprocity in coal is limited to "a score or so of American immigrants and a half score of small colliery operators in the west," was manifestly written in a moment of high excitement. It carries its own refutation.

One other misapprehension to which expression is given, is indicated in the last paragraph of our contemporary's interesting editorial. In this paragraph our suggestion that the whole matter be threshed out by the Canadian Mining Institute is vehemently damned; and the Institute is bluntly described as existing only for the benefit of the West. This is entirely erroneous. The Institute is a national body with international affiliations. It is the only national mining society in Canada. It is dominated by no sections or cliques. It is representative. The coal operators of Nova Scotia have always had more adequate representation in the Council of the Institute than the western operators have had. The Institute is not a tribunal; neither is it a star chamber. It is an organization whose only aim is to safeguard the mining industry of Canada. And its recommendations carry weight at Ottawa.

We regret, therefore, that our contemporary has so mistaken the spirit of our suggestion. The problem of reciprocity will be discussed at the annual meeting of the Canadian Mining Institute. It is fitting and necessary that it should be. And we sincerely trust that Nova Scotia's claim will be presented clearly, calmly, and without the accompaniment of fireworks. There are numerous aspects of the question that need investigation. We are of the opinion, for instance, that railway freight tariffs will provide food for thought. But the one essential is that the subject be approached with deliberation and courtesy.

We congratulate the believers in reciprocity on having so vigorous and so fearless an evangel and we merely suggest that smokeless powder can advantageously replace the older brand.

BANKS AND BUNKUM.

The Farmers' Bank of Canada suspended payment on December 20th. One of the incidents that led to the suspension was the investment of the bank's funds in the Keeley mine, South Lorrain, Ontario. In the course of a lawsuit that was settled adversely to the Farmers Bank immediately before it closed its doors, the judge commented harshly upon the unwisdom of the management, and sweepingly condemned the policy of mining investment on the part of such financial institutions.

With the wisdom or unwisdom of the Farmers Bank we are not concerned. It is humanly probable that the management's chief mistake lay in getting caught. Its larger brothers are not without sin; but they have more substantial reserves. They can drop incidental millions in Mexico without batting an eye. They can finance trusts and combines and promotions to any extent with profit to themselves, merely because it is their fixed habit to make the public pay. They have all the machinery necessary. The Farmers Bank had neither the machinery nor the cash. Therefore, its sister institutions will quietly appropriate its assets at a singularly low valuation.

This, however, is a digression. We referred to the judicial condemnation of mining investment. That condemnation was uncalled for. An investment may be either good or bad. The bank's investment, if it was bad, was not so merely because it was a mining investment. Properly controlled mining investments are as sound and as profitable as any other. It implies sheer ignorance of facts to dispute this, and to sound a warning against mining investment *per se* for the sole reason that one particular venture has been badly managed, is illogical in the extreme.

It is obviously true that a chartered bank has no right to speculate in mining. Investment, however, is a totally different thing. The investment of money in developed ore reserves may not only be justifiable, but it may also be extremely profitable. But it must always be postulated that the investment be directed on proper banking principles, and that advances be made against ascertained physical assets.

It will be a happier day for Canada when more of our banks put their (or, rather, our) money into Canadian mines rather than into tropical indiscretions and awful amalgamations.

If, for instance, the caution that is exercised in real estate investment, obtained in what is popularly known as mining investment, then no one would have ground for complaint. That this is possible is proved by the fact that leading English, French, and German financial houses are heavily interested in mines. The attitude of Canadian banks is neither sane nor business-like.

A TRUE HERO.

To the roll of heroes must be added the name of Fred Alderson. Alderson was a fire-boss at Hosmer, B.C. When news of the coal-mine disaster at Bellevue reached Hosmer, Alderson was amongst the first to volunteer as one of the rescue party immediately formed. After assisting in bringing out two men, he returned alone to the mine to attempt to rescue a third. He was then overcome by afterdamp, and all efforts to resuscitate him were unavailing.

Particularly grievous circumstances surround the death of Alderson. He left a wife and four young children in England. As his services were voluntarily given, no one is liable for compensation. His friends and associates are collecting money for the bereaved family, but no collection of this kind can be adequate.

Alderson was the best type of intelligent, loyal and brave Englishman. He hesitated not one moment in laying down his life in the attempt to save his fellows. No nobler death can be hoped for.

The Government of Alberta should act without delay. Such occasions do not arise often. The Government's manifest duty is to provide handsomely for Alderson's family. We cannot believe that any discussion of this point will be considered necessary.

PORTLAND CANAL.

Through the clear and forceful prelimanry report on the Portland Canal Mining Division, written by Mr. W. Fleet Robertson, we are enabled to give our readers a well-balanced idea of that much talked of camp. Mr. Robertson is satisfied that the camp has realized reasonable expectations so far as it has been developed. He deprecates strongly foolish attempts to circulate inflated reports.

An abstract of Mr. Robertson's report appears in this issue of the CANADIAN MINING JOURNAL.

BOOK REVIEWS.

RECORD OF THE FIRST SERIES (1908-09) OF THE BRITISH COAL DUST EXPERIMENTS CONDUCTED BY THE COMMITTEE APPOINTED BY THE MINING ASSOCIATION OF GREAT BRITAIN. 212 PAGES — ELABORATELY ILLUSTRATED WITH HALF-TONES, DIAGRAMS AND COLOURED PLATES. PRICE, $3.00 NET. PRINTED AND PUBLISHED BY THE COLLIERY GUARDIAN COMPANY, LIMITED, 30 FURNIVAL STREET, HOLBORN, LONDON, E.C.—1910.

This record of the coal-dust experiments carried out during 1908 and 1909 at the Altofts Experiments Station, is decidedly the most notable contribution to the literature of a subject that sorely needs attention. At no time could the appearance of such a volume be more timely than at present. The loss of nearly three score lives in a Canadian colliery has been followed by an awful coal mine disaster in Great Britain.

The magnificently illustrated volume before us is the first of a series. It presents the results of experiments dealing with the effect of dustless and stone dust zones upon explosions of a mixture of coal dust and air. Other investigations are not yet sufficiently advanced to warrant publicity. One definite result of the experiments under consideration is that the explosive nature of a mixture of coal dust and air in the absence of inflammable gas has been conclusively proved. The experiments were conducted in the absence of inflammable gas, and without permitted explosives.

The book is divided into two parts. Part I. covers the equipment used and the work done in determining the explosive nature of coal dust. In Part II. the mode of propagation of coal dust explosions is discussed.

A lucid summary of the work accomplished is appended, along with a synopsis of supplementary experiments with Welsh, Scotch, and South African coals.

The work herein described was begun and carried out by the Mining Association of Great Britain. A sum of £10,000 was raised by means of a levy on a tonnage basis, to which all the collieries in the association subscribed, Altofts, Yorkshire, was chosen as a suitably central location, and Mr. W. E. Garforth was placed in charge of the construction and operation of the gallery. The gallery was built on lines suggested by the same gentleman.

The gallery was constructed of second-hand boiler shells, principally made of wrought iron, 7-16 inch thick, but in some cases of steel. The main gallery was given a length of 600 feet; the return gallery a length of 295 feet. The main tube, or intake, is 7 feet 6 inches in diameter, and the return gallery 6 feet. The main tube is one straight length. The return is zig-zag in form, and 6 feet in diameter. Both are strengthened with hoops and chains. Full details of the construction are given in Part I., Chapter 2.

Suitable power equipment was also installed to run a "Siroceo" fan capable of passing 80,000 cubic feet of air per minute, with a water gauge of 3 inches. Many measuring and special devices were added, including a kinematograph.

Most interesting is the description of the expedients resorted to in conducting the coal dust experiments. These cannot be detailed here. But it is appropriate to remark that each step was conceived and completed with admirable care and thoroughness.

Chapter 3 of Part I. treats of the explosiveness of coal dust when raised as a cloud in air. Chapter 4 takes up fully the chemical analysis of coal dust. Then follows a description of the instruments used in measuring pressure, velocity, products of combustion and temperature. Next come chapters on experiments in checking explosions with stone dust, laboratory investigations and microscopical investigations.

The contents of Part II. have already been indicated.

The summary contains an outline of the objects and results of the coal dust experiments. Here, also, allu-

sion is made to the many important questions that are to be tackled in the future.

Three paragraphs are herewith quoted, one to define the object, one to define the results, and one to show the future direction, of the present enquiry.

"The main objects of this enquiry are (1) to demonstrate, as conclusively as possible, the danger that exists from the presence of fine coal dust in the roadways of mines; (2) to discover, if possible, an effective remedy as an alternative to watering; and (3) to investigate the chemical and physical phenomena that accompany coal dust explosions."

"The fact that coal dust, in the complete absence of fire-damp, is explosive when raised as a cloud in air and ignited, has, in the opinion of all who have witnessed the experiments, been definitely established. The information which the Royal Commission on Accidents in Mines desired . . . has thus been obtained, and the controversy which has existed for more than a quarter of a century has been finally set at rest."

"Of the many other questions, (to be attacked in the future), perhaps the most important are:

(a) The determination of the maximum and of the minimum quantity of coal dust that will allow explosion to be propagated; either in pure air or in air containing a small percentage of fire-damp.

(b) The testing of permitted explosives under various conditions.

(c) The determination of the minimum volume, intensity and duration of flame necessary to cause ignition of coal dust when raised as a cloud in air."

* * *

It is not hyperbole to state that the volume before us is the most important pronouncement upon certain phases of the coal dust problem that has ever been printed. In fact it is, so far as we are aware, the only final and authoritative exposition extant. Without doubt, no coal mine operator can afford not to study it carefully.

As regards the typography and general presswork it is difficult to speak too highly. The type is large; clear, and clean. The paper is of excellent quality. The photogravures and coloured plates are as near perfection as can be. The price is disproportionately low. Possibly this may account for the one incidental shortcoming, the flimsy binding.

Both the compilers and the publishers deserve praise for the standard that they have set.

PRACTICAL SHAFT SINKING, BY FRANCIS DONALDSON, M.E., CHIEF ENGINEER THE DRAVO CONTRACTING COMPANY, 143 PAGES, ILLUSTRATED WITH HALF-TONES AND DIAGRAMS. PRICE $2.00, NET. McGRAW-HILL BOOK COMPANY, 239 WEST 39TH STREET, NEW YORK, 6 BOUVERIE STREET, LONDON, E.C. 1910.

For Canadian operators no book could be more timely than this. At the present time hundreds of new shafts are being sunk in opening up new properties. It is not unusual to see painfully careless work done. This is needless and costly. A good shaft is cheaper than a bad one.

The ten chapters are headed thus:—

1. Some deep shafts—features of contracts for sinking—form of contract.

2. Plant required—boilers, hoisting engines, headframe, and bucket—air compressors.

3. Sinking through surface—soft ground—wooden sheeting—steel sheeting—caissons of steel, wood, or concrete.

4. Sinking through soft ground—pneumatic process—shield method.

5. Sinking in rock—arrangement of holes—tools and methods used in drilling—costs and speed.

6. The sinking-drum process—mammoth pump—the freezing process.

7. The Kind-Chaudron boring process—cementation of water-bearing fissures.

8. Lifting water—horizontal vs. vertical pumps——handling pumps in shaft—Cornish pumps.

9. Shaft linings.

10. Concrete linings—costs per linear foot for rectangular, elliptical, and quadrilateral shafts.

"Practical Shaft Sinking" is intended rather for the engineer in charge of very large operations, than for the small operator. For instance, in the section on cementation of water-bearing fissures, the use of core drills is advised for locating the fissures. This presupposes a class of work that the engineer is very rarely called upon to undertake. Hence the volume may fairly be placed in the category of specialized hand-books.

MORE RECENT CYANIDE PRACTICE, EDITED BY H. FOSTER BAIN, 424 PAGES, ILLUSTRATED. PRICE $2.00 POSTPAID. PUBLISHED BY THE MINING AND SCIENTIFIC PRESS, 667 HOWARD STREET, SAN FRANCISCO, AND THE MINING MAGAZINE, 819 SALISBURY HOUSE, LONDON, E.C. 1910.

Like its predecessor, "Recent Cyanide Practice," the volume before us is a compilation of articles culled from Mining and Scientific Press. "More Recent Cyanide Practice" not only supplements the former book, but also touches new fields.

As there are some dozens of contributors, there are, necessarily, conflicting views expressed. No effort has been made to smooth over these differences of opinion. Each article is given for what it is worth.

The articles are arranged logically, the first dealing with ore-crushing, sliming, tube-mill practice, and so on; and the rest touching successive phases of mill work. Filtering, agitation, assaying, testing, and kindred topics are discussed.

"More Recent Cyanide Practice" is by no means a complete handbook; it is a suggestive collection of practical data, of data that will help the millwright, the operator, the chemist, and the general reader.

COMPRESSED AIR PLANT—THE PRODUCTION, TRANSMISSION AND USE OF COMPRESSED AIR, WITH SPECIAL REFERENCE TO MINE SERVICE. BY ROBERT PEELE, PROFESSOR OF MINING IN THE SCHOOL OF MINES, COLUMBIA UNIVERSITY. SECOND EDITION—REVISED AND ENLARGED; 502 PAGES, ILLUSTRATED. PRICE $3.50 NET. PUBLISHED BY JOHN WILEY & SONS, NEW YORK, 1910.

"Compressed Air Plant" has already been reviewed in these columns (see page 505, Vol. 229, 1908) The second edition is larger and more complete. Attention is paid to the construction and operation of rock-drills, coal-cutting machines, and channeling machine. Chapter X. is a record of compressor tests made in Cobalt. The material of the chapter appeared first in the CANADIAN MINING JOURNAL February 15, 1910. Acknowledgement of this fact is omitted.

The increase in price—the former price was $3—is quite justified.

"Peele's Compressed Air" is now accepted as a standard work. The engineer who is armed with it and with another book reviewed in this issue, is fortified against all the slings and arrows of refractory compressors and inefficient drills.

COAL MINING IN CAPE BRETON DURING 1910.

(A Resume by our Glace Bay Correspondent.)

The year 1910 has been one of consistent progress and compares very favourably with the years before the labour troubles that have disturbed Nova Scotia so recently, and have not yet entirely disappeared. With the single exception of the Cumberland Coal & Railway Company, the outputs of all the Nova Scotian Coal Companies will equal the figures of 1907 and 1908.

The outstanding features of the year have been the "merger" of the Dominion Coal Company with the Dominion Iron & Steel Company, under the common control of the Dominion Steel Corporation, and the ending of the United Mine Workers' strike at Glace Bay. Early in the year the new management of the Dominion Coal Company announced that recognition of the United Mine Workers was against the policy of the company, who were, however, and always had been, perfectly willing to receive committees of their workmen. During the first quarter of the year several attempts were made to end the strike, but proved unsuccessful, owing to the insistence of the United Mine Workers upon formal recognition of their union. At the end of April the U.M.W. leaders abandoned their position, recognizing that it was an untenable one, and advised the strikers to return to work. They commenced to do this at the beginning of May, and by the end of that month places had been found for the majority of the men who had been on strike.

Beyond the ordinary accident rate, it is gratifying to relate that there have been no serious disasters in Cape Breton coal mines during the year. In February what might very easily have been a serious cage accident at No. 2 Colliery was averted by the successful operation of safety detaching hooks. In this accident several men were injured, but there was no loss of life. In March, two corps of trained men, with Draeger apparatus and accessories, were sent from the Nova Scotia Steel & Coal Company and the Dominion Coal Company to aid in fighting a mine fire at the Albion mine of the Acadia Coal Company, and they were able to afford valuable assistance.

The final report of the Eight-Hour-Day Commission was presented to the Nova Scotia Legislature at the spring session. The gist of the report, so far as it related to coal mining, was that the Commission were unable to report in favour of a shorter day, although it was stated that they would gladly have done so had the facts permitted. The report stated that a general and compulsory eight-hour law "would be at present a fatal blow to the industrial prospects of Nova Scotia."

Some rather extraordinary legislation was proposed arising out of the U.M.W. strike. One bill proposed to enact compulsory recognition of labour unions by employers of labour under penalty of fines, such fines to be collected by the union demanding recognition. It is needless to state that such a proposal did not become law.

The report of Mr. T. E. Forster, of Newcastle-on-Tyne, on the future methods to be pursued in the extraction of the submarine coal areas of the province was presented to the House, but no legislation in connection therewith was proposed.

The Government introduced a Workmen's Compensation Act, which followed closely the lines of the British Compensation Act. The proposed legislation met with opposition from the Colliery Relief Societies, and committees from these represented to the Government that the Compensation Act proposed would, in all probability, react disastrously upon the societies, which had been in satisfactory operation for some fifteen years. Acting upon the representations made by these committees, the Government exempted from the operation of the Compensation Act such steel works and collieries at which properly constituted relief societies were in existence, provided that such societies had the approval of the Government and were able to afford adequate relief to disabled members. The Relief Societies at the collieries of the Dominion Coal Company, hitherto existing as independent societies, amalgamated at the first of July into one large society, now known as the Dominion Coal Company Employees' Benefit Society. This organization is supported by a contribution of 50c. per man per month from the members, 50c. per month per member from the Coal Company, and a contribution from the Government of three-quarters of one cent per ton on all coal paying royalty. The Government's contribution amounts to about 12c. per month per man, thus the society has an income of, approximately, $1.12 per member per month. The relief paid is $6.00 per week for twenty-six weeks for disability to work, whether caused by accident or by sickness, followed by half pay for a further period of twenty-six weeks; then by $2.00 per week for two years. After which time, if the disability continues, a special grant may be made at the discretion of the society. At death, whether from natural causes or accident, a payment of $100.00 is made immediately to the dependents of the deceased, and an allowance of $8.00 per month for five years is made to the widow, with $3.00 per month for each child until it attains the age of fourteen years. In addition to these regular benefits, special grants may be made for loss of limbs, total disability or loss of eyesight. After four months operation, the total funds to the credit of this society amounted to $83,000. When circumstances will allow, it is proposed to inaugurate an old age pension scheme, for which purpose the sum of $25,000 has already been set aside. By the end of the year it is expected that the membership of the society will be over seven thousand. One of the chief reasons advanced by the Relief Societies in asking that no legislation should be enacted which would interfere with their continuance was that the greater proportion of the relief paid in the past had been for sickness. The experience of the old societies was that, while 35 per cent. of the moneys paid out in relief was for disability caused by accident, 55 per cent. was paid for disability resulting from sickness. In the operation of the new society, so far, the same thing has been observed, more particularly as the year 1910 has been remarkable for the large number of cases of infectious diseases which have occurred in the colliery districts. The consolidation of the funds of the branch societies into one central treasury has made it possible to obtain a higher interest rate on the accumulated funds than was previously possible, and it is expected that the cost of management will be also considerably reduced. The consolidation has further given greater stability and permanence to the societies, particularly at old collieries which before many years have passed will be abandoned by reason of exhaustion.

In August the Royal Commission appointed by the Federal Government to inquire into the status of technical education in Canada, visited Glace Bay and Sydney.

The sitting at Glace Bay was noteworthy by reason of the evidence given by colliery officials of all grades who had achieved their present positions largely through the facilities for technical education in mining afforded by the Nova Scotian Government.

At the end of 1909 the Coal Companies of Nova Scotia at whose works strikes of the United Mine Workers were in progress, were proceeded against at the instance of this union on a charge of conspiracy to raise the price of coal and increase the cost of mining. After a protracted trial, chiefly remarkable for the amusement which the statements of the witnesses afforded the public, the grand jury of the Supreme Court of Nova Scotia found "No Bill."

In September, the Federal Government called a conference of manufacturers of explosives, mine managers and others interested in the manufacture and use of explosives, to confer as to suitable legislation in connection therewith. The Canadian Government has obtained the services of Captain Desborough, of the Woolwich Arsenal Testing Station, and it is expected that a bill governing the manufacture and use of explosives in Canada will be drafted for presentation to Parliament during the winter. This is a matter which intimately concerns all interested in coal mines, and it may be observed in passing that the Nova Scotian regulations governing the use of explosives in mines are comprehensive and based on large experience.

The most marked development has taken place in the Lingan-Victoria field, worked by the Dominion Coal Company. No. 12 Colliery is now producing about 1,000 tons per day, and No. 14 Colliery (which is also on the Victoria seam) will be in a position by next spring to produce up to 800 tons daily. No. 15 Colliery (on the Lingan seam) is in the developing stage, and will have an output in the 1911 season of about 250 tons daily. The permanent bankhead and other colliery erections will be undertaken next year. The site of No. 16 Colliery (Lingan seam) is cleared and the work of development will be proceeded with at a rate which will bring this colliery to its average production in 1913. It is less than three years since the first openings were made in this district, and it now has a population approaching two thousand, and a monthly production of 30,000 tons of coal. A project is under consideration to extend the tram lines of the Cape Breton Electric Company to the new collieries, and give communication with Glace Bay and Sydney. The extension of the Dominion Coal Company's operations to this coalfield has resulted in a great increase in property values, and it will not be many years until the Lingan district will rival Glace Bay.

Considerable underground development work has been done at the new mine of the Dominion Steel Corporation at Birch Grove. This is situated on what are known as the Cumberland areas, lying immediately to the rear of the Dominion Coal Company's areas in the Glace Bay basin. As yet no permanent surface buildings have been erected.

An innovation in colliery practice in Nova Scotia which is likely to be largely followed is the exhaust steam turbine which has been installed at Dominion No. 2 Colliery. This turbo-generator unit consists of a Rateau impulse-type, five-stage, multi-cellular, low-pressure turbine directly connected with a Brown Boveri 1,000 k.w. alternator. The plant includes a barometric condenser with the necessary air pumps and centrifugal pumps for the condensing water. It is more than probable that a second turbo-unit will be installed side by side with the present one, as there is still a large amount of waste steam which it is possible to utilize. This is the first application of exhaust-steam turbines to colliery power requirements which has been made in Canada.

An automatic coal-handling plant for the large boiler house at Dominion No. 2 Colliery is to be installed shortly, the contract for this having been already let.

The Dominion Coal Company has decided to erect a modern coal washery having a capacity of 120 tons per hour. It is probable that the washer will be of the Baum type, but the contract is not let at the time of writing. No washer on this principle has as yet been erected on this side of the Atlantic.

THE MINING INDUSTRY IN THE PROVINCE OF QUEBEC DURING, 1910

(Written for the CANADIAN MINING JOURNAL, by Theo. DENIS, Superintendent of Mines for Quebec.)

The radical changes introduced in 1909 in the Quebec Mining Law have now been in force for over a year, and all the mining rights which were held under the old prospecting licenses were not renewed after their expiration on the first of January, 1910.

The results of the new provisions of the mining law have been very satisfactory, and although one year is too short a period from which to draw definite conclusions, it is gratifying to note that during 1910, prospecting in the Province of Quebec received a decided impetus, which, in a great measure, was stimulated by the changes in the Mining Law.

Figures of production for the year are not yet at hand, as returns from mining companies are received during January, but it may be said that everything points to an appreciable increase in the total figures, which in all likelihood will reach the $6,000,000 mark.

Asbestos.

Asbestos is, of course, the backbone of the Quebec mining industry. It is now ancient history that eighteen months ago some of the important mines at Thetford, Black Lake, were consolidated into two large syndicates with a capitalization of $25,000,000 and $5,000,000 respectively. It was claimed at the time of the promotion and organization of these mergers that very beneficial results could be derived from such a policy. Among these are economy in management and in the sales department, campaigns of publicity to extend the uses of asbestos and a consequent stimulation of the industry. Great stress was laid on the question of standardizing the grades of asbestos, which, up to the time of the merging had to be sold practically on samples, as each mine had a different grading of the various products of the mills. As a matter of fact, in 1909 some 35 names of

grades of "mill-stock" were used, to designate the various qualities produced by the different mills of the district, and this must have been rather bewildering to the buyer. A great improvement in the standardizing has since taken place; but, on the other hand, it must be owned that all the benefits derived from the consolidation of interests could just as well have been attained with a lower capitalization. A glance backward will show that on January 1st, 1910, the total capitalization of the asbestos companies which sent in returns of production was over thirty-five million dollars, whereas the total value of the products of the mines was slightly under two and a half million dollars.

The stimulus which asbestos mining received in 1910 was indeed very notable during the first seven months of the year. The mines were working night shifts, as well as day shifts, and the mills were producing actively. In some cases this activity was probably induced by the hope of making a creditable financial showing in spite of the heavy obligations always inherent to high capitalization. Unfortunately, the consumption of asbestos did not keep pace with the increase of production, the latter gradually creeping ahead of the former, and, as a result, the industry is at present going through a crisis, the severity of which, however, must not be exaggerated. Stocks on hand are very large, a great many mines have had to shut down altogether, and all the others have curtailed their production. The aim in view was certainly not attained, and the high pressure production did not result in high dividends.

That the present tightness of the asbestos market is only temporary is very patent by the past records. From an annual production of a few tons thirty years ago, the industry has grown to 65,000 tons or more, and no one doubts that in a few months matters will have readjusted themselves and the steady development will continue. On a smaller scale this has happened before, and periods of overproduction and consequent depressions have been followed by periods of healthy growth.

From the technical standpoint the mines and mills are in splendid shape. Economics of all sorts have been introduced in all the branches of the industry.

The Bell mines have gone on steadily with their underground development work, and they now have a proved territory representing a large tonnage all blocked out. In depth, the mines of the district show no decrease whatever in the asbestos content of the rock and faith in the life of the deposits has been shown by the construction of new mills and the extension of old ones.

The Black Lake Consolidated has erected a new mill of a capacity of some 1,200 tons of rock a day, adopting the new Torrey Cyclones, which proved so satisfactory at Danville.

The Jacobs Asbestos Company, who re-opened the old Murphy mine in 1909, erected a large mill and both the mine and the mill are giving satisfactory results.

The Bell Asbestos Mines enlarged their mill, which has now a capacity of about 1,000 tons of rock a day.

The figures of shipment of asbestos will show a substantial increase over those of the previous year, in spite of the comparatively large stocks on hand.

Copper.

A new mine has been added to the list of shipping mines. This is the Weedon mine, situated on Lot 22, Range II., of Weedon Township. The deposit worked here was discovered by Mr. McDonald, a couple of years ago. After proving the existence of an important deposit of cupriferous sulphides, the Eastern Canada Smelting Company acquired the property and is now working it systematically.

The nature of the deposit greatly resembles the one successfully worked at the Eustis mine. But the copper contents of the Weedon ore shipped so far are higher than in the Eustis ore.

The slope of the Eustis mine has now attained a length of 3,000 feet and ore has been shipped steadily. It is interesting to note that the manager, Mr. Adsit, is now saving an appreciable amount of copper by passing the mine water over scrap iron.

The small copper smelter at Actonvale was completed and operations begun, but it is yet in the experimental stage. It consists in the main of a water jacketed furnace of a capacity of 80 tons a day, with the accessory apparatus, blower, forehearth boiler, etc. The original intention was to treat the large dumps of the old Actonvale mine, but this is low-grade and will require concentrating.

Mr. A. O. Norton went on with the development work at the Suffolk mine, but no shipments were effected.

The old Ascot mine, the Harrington mine, and the Hepburn mine also received attention, but on a small scale, and all the work done was of a prospecting nature.

Some work was also effected on copper deposits in the Beauce district, near St. Joseph, on veins containing an appreciable quantity of bornite and chalcopyrite.

Gold.

The alluvial deposits of the Beauce region have been the object of special attention on the part of a Montreal Syndicate, incorporated under the name of the Dominion Gold Fields Company. This syndicate, in the latter part of 1909, acquired the gold and silver mining rights of the de Lery estate over the whole of the Rigaud-Vaudreuil Seigniory, and immediately set to work to do systematic prospecting. During 1910 several series of bore holes, by means of Empire drills and a Keystone drill, were put down to test the gravel down to bed rock. The results have been very encouraging, and after testing the auriferous ground, on the Gilbert River, the Des Plantes River, and the Meules Creek, the company has decided for the present to concentrate operations on the last-named stream. Water for hydraulicking is obtained from Lake Fortin, a sheet of water 1¼ miles by ¾ mile, and is to be brought to the workings by a ditch 7 miles long, part of which is flumed. The tailings will be disposed of by an elevator and stacker 45 feet high, and the ground attacked by two monitors under a head of water of over 200 feet. The ditch is now practically finished, the elevator is being constructed by the New York Engineering Company, and it is expected that early next spring the plant will be in operation.

Graphite.

Three companies have been working the graphite deposits of the Buckingham district, and substantial shipments of the refined products are said to have been made. The success of the graphite industry in Canada resolves itself into a question of concentration. That the deposits of disseminated graphite are very extensive has been known for a number of years; during 1910 improvements have been introduced, and it is claimed that the question is satisfactorily solved and that the graphite industry is now on a more solid basis than ever before.

A new important deposit has been opened on lots 20 and 21, Range V., of the township of Buckingham, on what is known as the Stuart property. The ore has been exposed over a large surface, and is said to average 15 per cent. graphite of which 10 to 12 can be saved. The erection of a 200-ton mill is contemplated.

A new syndicate, "Graphite, Limited," is opening a deposit on Lots 16 and 17, Range VII., of the township of Amherst.

On the whole, the outlook of the graphite industry for 1911 is promising.

Chrome Iron Ore.

Practically nothing was done in chrome mining during 1910. All the mines and mills were closed down, and if any shipments were made it was from stocks on hand.

The chrome deposits of the serpentine belt are essentially concentrating propositions, and are at a disadvantage when competing with New Caledonia and Turkish ores. It is said that these can be delivered in New York at $14.00 and less per gross ton, or $12.50 per ton of 2,000 lbs., whereas under present conditions $15.00 for Canadian ore does not leave much margin for profit.

Mica.

The mica industry was very quiet throughout the year. During 1909 the prices had been unsatisfactory and large stocks had accumulated. The greater part of the shipments effected during 1910 was from the stocks.

Iron.

Nothing of note occurred in the iron industry. The furnace at Radnor Forges produced steadily, but as in past years the greater part of the ore used comes from Ontario.

Titaniferous Iron Ore.

The very large deposits of titaniferous iron ore of the province attracted a great deal of attention during the year. Numerous enquiries concerning these were received at the Bureau of Mines and several deposits were examined by American engineers. Experiments on mechanical elimination of the TiO_2 have been going on for some time in the United States, and some iron producers are willing to enter into contracts for ore of 50 per cent. iron and 20 per cent. TiO_2. Several thousand tons have been shipped from the St. Urbain deposits to titanium steel manufacturers.

Magnesite.

The Canadian Magnesite Company is working the deposit in the township of Grenville and production this year will be appreciably greater than in 1909. This magnesite is used in the manufacture of aerated waters and also in the manufacture of a flooring cement of high quality.

Building Materials.

The development of the building material industries is, of course, steadily increasing with the growth of population and expansion of the other industries. The output of the quarries of limestone, granite, and other stone will certainly show a substantial increase. We note the opening of a new marble quarry at South Stukeley, which is now producing a beautiful ornamental stone. The marble quarries of Philipsburg have worked steadily throughout the year, and their stone finds a very good market both in Canada and in the United States.

The northern part of the Province of Quebec is beginning to attract a well deserved attention, more especially in the northwest parts of the province in the Temiskaming and Abittibi regions. The extensive patches of Huronian rocks, which will be made comparatively accessible by the Transcontinental Railway, will in all probability well repay thorough and systematic prospecting operations. A promising deposit of gold is being developed at Lake Opasatica. Large quantities of molybdenite are said to be available at Lake Kewagama and a great deal of development work was done on this deposit during the summer by a Quebec syndicate. On the whole, we may look forward to a substantial development and an expansion of the mining industry in both the settled parts of the Province of Quebec and in its "hinterland."

ONTARIO IN 1910

Written for the CANADIAN MINING JOURNAL by T. W. GIBSON, Deputy Minister of Mines.

The mining industry of Ontario continues to make rapid and steady progress. In money value at the point of production and in the form produced, the output of the mines and mineral works for 1910 was worth about 30 million dollars, while, if based upon the refined metals or products, the value would be increased by about 13 millions—say 43 millions in all. The aggregate for the whole of Canada on this basis in 1909 was 90 million dollars; consequently, Ontario is now turning out in value almost one-half the total production of the Dominion. As this province produces no coal—the output of which in Nova Scotia, British Columbia and Alberta amounts to about 24 or 25 million dollars per annum—it is apparent that in the production of metals Ontario easily takes first place among the provinces.

Silver.

In the list of Ontario metals silver and nickel are the chief, claiming the Cobalt and Sudbury districts as their respective places of production. The yield of silver from the Cobalt mines began in 1904 with 206,875 ounces; in 1910 it may be put down at not less than 27 million ounces. For the first nine months of the year the yield was 19,791,033 ounces, and, as the last quarter is expected to show a somewhat increased production, 27 million ounces may be accepted as a conservative estimate. For the seven years, 1904 to 1910 inclusive, Cobalt has added over 90 million ounces to the world's stock of silver. Ontario's annual production is now about three-eighths that of Mexico, and fully one-half that of the United States, the two leading silver-producing countries.

An analysis of the shipments for the first nine months of last year does not show that there has as yet been any serious diminution in the silver contents of the Cobalt ores. In 1904 the average of the shipments was 1,309 ounces per ton; in 1905, 1,143 ounces; in 1906, 1,013 ounces. During these first three years of the camp's existence, high-grade ores only were shipped, and the figures showing the average silver contents reflect this fact. In 1907 low-grade ores began to be sent out freely, and the average fell to 667 ounces per ton. Concentration plants came into use in 1908, and ore shipments that year averaged 736 ounces silver per ton, rising in 1909 to 809 ounces. The ore shipped during the first nine months of 1910 contained on an average 767 ounces. Shipments for this period were ore, 19,191 tons; concentrates 4,633 tons.

The list of producing mines remained much the same as in 1909. It included Nipissing, Crown Reserve, Kerr

Lake, La Rose, McKinley-Darragh-Savage, Coniagas, O'Brien, Temiskaming, Buffalo, Hudson Bay, Trethewey, etc. One feature of the year was the rise of Temiskaming.

In South Lorrain, Wettlaufer is attracting considerable attention, and in Gowganda, Millerett and Miller Lake-O'Brien, particularly the former, have shipped considerable high-grade material. Neither of these fields, however, has as yet shown the qualities of a Cobalt.

It is satisfactory to know that a large part of the Cobalt production is now treated in refining works within the boundaries of the province. At Deloro, Thorold and Copper Cliff well-equipped smelters are now turning out merchantable bars which go direct to the great silver marts of the world, principally London.

Nickel.

The second staple of the mining industry of Ontario is nickel, the output of which is increasing with much rapidity. Ten years ago the nickel mines yielded 3,540 tons of the metal; five years later this had risen to 9,503 tons, while in 1910 the output will be in the neighbourhood of 18,000 tons. It is curious that in the ores of both nickel and cobalt, the French penal island, New Caledonia, has until lately been the chief competitor of Ontario. The advantage in each has proved to be with this province, and the nickel and cobalt deposits of New Caledonia are now but little worked.

At the Sudbury mines, as is well known, the ore is a pyrrhotite carrying both nickel and copper, the former predominating. After being raised and crushed the ore is roasted in the open air and afterwards smelted in blast furnaces to a bessemer matte, containing say, eighty per cent. of nickel and copper. A considerable quantity of ore, however, is now smelted without preliminary roasting. The matte is exported to the United States and England where final separation of the metals takes place. The producers are the Canadian Copper Company and the Mond Nickel Company, the former being the larger concern. The principal deposits worked by the Canadian Copper Company are the Creighton and Crean Hill mines, the former being richer in nickel than in copper, the latter vice versa. The Mond Company has for years worked the ore bodies at Victoria Mines, but, latterly, has operated as well the Garson mine in the township of that name, and is contemplating the removal of its smelter to a point on the railway nearer that property. The outcrop of nickeliferous pyrrhotite in Dundonald Township, on the T. & N. O. Railway, which so much resembles the Sudbury ores, did not undergo any further development during 1910. It is said that the result of diamond drilling by the Canadian Copper Company did not prove the existence of large bodies of ore.

Gold.

There is ground for hope that the long record of disappointment in connection with gold mining in Ontario is about to be broken. The spectacular showings of free gold in the quartz outcrops at Porcupine have been worked to considerable extent during the past year, and further discoveries as well have been made. It is fortunate that some of the most promising finds passed into the control of capitalists well able to test them, as in the case of the Timmins and the Dome mines. At both, small experimental stamp mills are being replaced by larger plants. Now that nature and winter have given Porcupine passable roads, machinery and supplies are pouring into the camp, and next year will undoubtedly make or break its reputation as a gold producer.

The Ontario Government has intimated its intention of building a branch of the T. & N. O. Railway from the main line near Kelso into the new gold field, a distance of about 30 miles. The country is not rough and there are large areas of farming lands surrounding the mining camps. The gold at Porcupine is found in veins contained in Keewatin and Huronian rocks, the veins themselves being mostly composed of quartz, and also in some instances of ferruginous carbonate cut by quartz stringers. At Long Lake, on the Sault branch of the C.P.R., a promising gold prospect is being operated by the Canadian Exploration Company, of Montreal. The ore contains some arsenic.

Iron.

The mines producing iron ore are, Helen mine at Michipicoten, Moose Mountain, Atikokan, and Bessemer, the last-named being in the County of Hastings. During the first nine months of 1910 the output was 121,488 tons. The blast furnaces at Port Arthur, Sault Ste. Marie, Midland, Hamilton and Deseronto during the same period produced 319,698 tons of pig iron, and the total production for the year will probably be 425,000 tons.

Copper.

The chief source of copper is the Sudbury pyrrhotite, and, to some extent, this metal is a by-product of nickel mining. For the first nine months of 1910 the matte product of the Sudbury furnaces contained 7,168 tons of copper, and the yield for the full year would, at this rate, be in the neighbourhood of 9,500 tons, which is 1,500 tons more than the output for 1909. There are deposits of chalcopyrite at Bruce Mines and elsewhere on the north shore of Lake Huron, and also on the north shore of Lake Superior, but at present these do not contribute largely to the production of copper.

Cobalt.

An interesting example of the disturbance of market conditions, caused by excessive production of any one useful commodity, is afforded by the present condition of the cobalt oxide industry. The enforced production of cobalt ore at the silver mines in the Cobalt district is now far beyond the world's capacity for consuming cobalt products, the principal of which is the oxide, mainly employed to give a beautiful blue colour in the china and enamelled ware trade. In consequence the price has fallen from $2.50 to 80 cents per pound, with the possibility of a further decline. It may be that the cheapness of cobalt will open up new uses for the metal or its compound. An alloy of cobalt and chromium has been invented and is said to be very suitable for the manufacture of cutlery.

Southwestern Ontario.

It must not be overlooked that the southwestern peninsula of Ontario is an important source of production for a number of useful mineral substances, including petroleum, natural gas, salt and gypsum. The output of crude petroleum has been declining for a number of years, and the downward curve continued during 1910. The yield in 1909 was 14,723,105 imperial gallons, while in 1910 the output will probably prove not to be in excess of 11,000,000 gallons. The decrease is apparent not only in the older oil fields of Petrolea and Oil Springs, but also, and even in a greater degree, in the new districts of Tilbury and Romney, and this, in despite of the bounty of 1 1-2 cents per gallon of crude petroleum, paid by the Dominion Government.

Natural gas wells are, on the contrary, yielding more freely than ever before, and the output which in 1909 was valued at $1,888,179 will probably be exceeded by the yield of 1910. The benefits of this cheap and most

efficient fuel are now being enjoyed by the villages, towns, and cities of Southwestern Ontario, and, to a considerable degree, by the farming population as well. The gas fields are confined to the counties lying on the north shore of Lake Erie.

The salt industry has its seat along the eastern shores of Lakes Huron and St. Clair, the Canadian Salt Company, of Windsor, being the largest producer. Brine is pumped and evaporated.

Water Power.

The abundance of water power in the mining districts of Ontario is a favourable feature, conducing to economy in the operation of mines. In the Cobalt camp generation of power from wood or coal has practically come to an end, and the mines and mining works are now almost wholly operated by means of electricity obtained from water power situated on the Montreal and Matabitchouan Rivers. The cost of power in this way has been reduced from $150 or $175 per horse power per annum to $50. A similar development has taken place in the nickel region. The Canadian Copper Company and the Mond Nickel Company have developed water powers, one on the Spanish and the other on the Vermillion River, and both now work their mines and operate their machinery by the electric current. The Helen mine is also being operated by electric power derived from the Michipicoten River. In the Porcupine gold camp there are falls within convenient distance capable of affording all the power which the camp will require. Similar conditions exist in the mining districts of Eastern Ontario, where mines of graphite and pyrites, cement works and, at least, one smelting plant are operated by electric power produced by falling water. In estimating the advantages of the mining regions of Ontario this feature should not be left out of account.

Minor industries, yet in the aggregate of considerable importance, based on such materials as corundum, mica, graphite, pyrite, talc, etc., do not exhaust the long and varied list of the mineral resources of this province. Clay for brick and tile-making is abundant; so is limestone for building purposes and the manufacture of lime, and many varieties of granite and sandstone are easily procurable. Beds of the most beautiful varieties of marble for decorative interiors have been located, and are now being worked in the County of Hastings.

BRITISH COLUMBIA.

By E. Jacobs, Victoria, B.C.

An estimate of the mineral production of British Columbia in 1910 gives a net increase in value of $1,550,665, as shown in the accompanying table. It will be seen, though, that this is chiefly due to a substantial increase in coal, for with the exception of gold and a small addition to last year's total of silver, there was a decrease in the other minerals, these including lead, copper, zinc, and coke. Speaking generally, there has been a check in the production of lead, copper, and zinc, of the metalliferous minerals. In the case of copper, though, the opinion may be expressed that it is more apparent than real, for there appear to be grounds for concluding that last year's copper returns supplied to the Department of Mines in one or two important instances gave the assay value of the ore rather than the quantity of copper actually recovered at the smeltery. On the contrary, it is believed the figures used in the estimate presented herewith show the copper recovered. The estimate for 1910 follows:

Gold, placer, oz..	24,100	$482,000	I. $5,000
Gold, lode, oz...	257,000	5,312,190	I. 388,100
Total gold, oz.	281,100	$5,794,190	I. $393,100
Silver, oz	2,500,000	1,282,500	I. 43,230
Lead, lb.	37,000,000	1,480,000	D. 229,259
Copper, lb.	39,000,000	4,972,500	D. 946,022
Zinc, lb.	4,000,000	184,000	D. 216,000
Total metalliferous		$13,713,190	D. $954,951
Coal, tons, 2240 lb.	2,799,000	9,796,500	I. 2,773,834
Coke, tons, 2240 lb.	214,000	1,284,000	D. 268,218
Building materials, etc....		1,200,000	.....
Total mineral production.		$25,993,690	I. $1,550,665

In making calculations, the Engineering and Mining Journal average prices of metals for eleven months, to December 1, have been taken approximately. Following the official custom in the province, deductions have been made of five per cent. off silver, and ten per cent. off lead. Only 85 per cent. of the value of the spelter in the zinc concentrate has been allowed for. The prices used are: For placer gold, $20 per oz.; lode gold, $20.67 per oz.; silver, 51.3 per oz.; lead, 4 cents per lb.; copper, 12.75 cents per lb.; zinc, 4.6 cents per lb. Coal is at $3.50 per long ton, and coke at $6, these being regarded as fair average prices for British Columbia. Taking the several minerals separately, the following comment is submitted:

Gold.—The year's placer gold mining shows a small net increase. The season was not favourable for hydraulicking operations in Cariboo district, a shortage of water having prevented cleaning up at several of the larger mines, consequently only 10,100 oz. was recovered, as against 12,350 in 1909. Several small losses brought the total decrease up to 2,750 oz. Against this, however, Atlin, in Cassiar district, made a gain of 3,000 oz., so that there was a net increase of 250 oz., or $5,000 in the whole province.

In lode gold, the gain was 18,776 oz. Approximately one-half of this was made by the Hedley Gold Mining Company, operating the Nickel Plate mines, in the Similkameen, and the remainder coming in large part from mines in Sheep Creek camp, Nelson mining division, and in smaller degrees from Rossland mines. The British Columbia Copper Company's Wellington group mine—a new producer—also made an appreciably large addition to the year's lode gold production. There were not any decreases worth mentioning, the various mining divisions well maintaining their gold output. The outlook is favourable for a further increase in 1911.

Silver.—The quantity of silver produced was practically the same as in 1909. There were decreases in East and West Kootenay, chiefly in Ainsworth mining division, of the latter district, but these were compensated for by corresponding increases in the Slocan and Coast districts. Between 500,000 and 600,000 ounces of silver was recovered from copper-gold ores by smelteries; the greater part of the remainder came from galena ores. The recovery of silver at the Consolidated Mining and Smelting Company's lead and copper reduction

works at Trail was about 2,000,000 ounces, or four-fifths of the total of the province. For the first time, a Portland Canal mine contributed to the year's production.

Lead.—The decrease in this metal is about 7,000,000 pounds. The St Eugene mine, East Kootenay, was 8,500,000 pounds short of its 1909 production, but against this loss the Sullivan, in the same district, formerly idle, produced approximately that quantity. In Ainsworth division two of the larger mines were, together, 7,500,000 pounds short, in one case owing to the destruction of a concentrating mill by fire and the consequent loss of the greater part of the season's production. There were several gains in the Slocan—at the Richmond—Eureka, Van Roi, and Standard, notably at the last with an increase over 1909 of about 1,500,000 pounds. Summer fires cut down the production of silver, lead, and zinc at several important Slocan and Ainsworth division mines, destroying surface works at the mines and bridges and trestles along six or seven miles of railway, thereby practically stopping production for six months.

Copper.—Compared with the 1909 official figures production in 1910 was less by about 6,600,000 pounds. A reason for much of this seeming loss has already been given. The proportions of production by districts were: Boundary, 31,500,000 pounds; Rossland, 3,600,000 pounds; Coast, 3,200,000 pounds, and the remainder from other parts. The Granby Company's output was reduced following a destructive fire at the mines, which

interfered with ore-shipping and necessitated blowing out several furnaces at the smeltery until fresh arrangements could be made for resuming the normal output. The British Columbia Copper Company made a gain of about 1,000,000 pounds. Both the Consolidated Company, at Trail, and the Tyee Copper Company, on Vancouver Island, also made increases in production of this metal.

Zinc.—The production of zinc was seriously checked by the forest fires already mentioned. The Whitewater mill, up to last July, produced much zinc concentrate, and in 1909 the Lucky Jim mine shipped 5,000 tons of crude ore averaging about 45 per cent. spelter. The latter mine was within a week of being ready to ship on a larger scale than formerly, when the destruction of the railway took away its transportation facilities. Shipments will be resumed next year. The Ruth has 450 tons zinc concentrate not yet shipped from its mill at Sandon, Slocan. The Van Roi produced until August, when its lease of a concentrating mill expired; it is now building its own mill on Four-Mile Creek, 2,000 feet from portal of mine tunnel No. 5. This property is in the Slocan Lake district.

Iron.—While there are deposits of iron ore in various parts of the province there has not been any production in recent years.

Coal and Coke.—The comparatively large net increase in coal was the result of a general enlargement of operations at the ten collieries that have passed the preliminary stage of production. This is evident from the following approximate figures of net production: Vancouver Island collieries (5), in 1910, 1,616,000 long tons; in 1909, 1,386,000 tons. Nicola Valley colliery, in 1910, 141,000 tons; in 1909, 62,000 tons. Crow's Nest Pass collieries (4) in 1910, 1,026,000 tons; in 1909, 558,000 tons. One new colliery, in Similkameen district, commenced producing and added to the total. There was, however, less coal made into coke, which accounts in small part for the increase in coal sold as such. The gross production of coal during the year under review was 3,119,000 long tons, as compared with 2,400,000 tons in 1909. The opening of several new fields, or extensions of fields already producing, is in progress. These are, respectively, the Upper Elk River and the Flathead fields, which are northerly and southerly extensions of the present Crow's Nest Pass field; about Princeton and Granite Creek, in the Similkameen; in Nicola Valley; in the Skeena district, through which the Grand Trunk Pacific Railway is being constructed; on Graham Island, of the Queen Charlotte group, and on Vancouver Island. Prospecting for coal is being carried on north of Kamloops along the route of the Canadian Northern new railway, and as well in Northern Cariboo.

Notes of Progress.—In Cariboo, the producing capacity of Mr. John Hopp's hydraulic placer gold mines was considerably increased, and the Quesnelle Hydraulic Gold Mining Co. of Philadelphia, Pennsylvania, made much progress with construction of its 17-mile ditch and flume. In Atlin, a small but rich gold-quartz mine was opened on Taku Arm of Tagish Lake. In East Kootenay, the Consolidated Company put in an ore-testing plant at the St. Eugene mill, and re-opened the Sullivan lead mine, while the Provincial Government established a mine-rescue station at Hosmer, Crow's Nest Pass. In Slocan, the Van Roi Mining Company made progress with building a concentrator, and at the Standard a big shoot of galena ore was developed. At Rossland, another valuable shoot of gold ore was found in the War Eagle, and Le Roi No. 2 Company opened an ore body on the 1,300-foot level. In the Boundary, the British Columbia Copper Company commenced shipping gold ore from its Wellington group mine, and increased the blast furnace capacity of its smeltery at Greenwood 50 per cent. In the Similkameen, the Hedley Gold Mining Company put in a larger power plant and added fine-grinding and more gold-saving appliances at its 40-stamp mill. On Vancouver Island, the Tyee Copper Company increased its custom ore smelting business, while the Canadian Collieries (Dunsmuir), Limited, made important additions to its plant. Up North, the Portland Canal Mining Company built and equipped a concentrator and commenced production at its mine.

MINING IN BRITISH COLUMBIA

Preliminary returns, obtained unofficially from nearly all the producing mining companies, appear to warrant the conclusion that, in value, the mineral production of British Columbia was higher in 1910 than in any previous year in its history. A carefully prepared estimate, based on the returns above mentioned, gives a total value of all minerals produced in the province in that year of nearly $26,000,000. If this estimate shall prove approximately correct—and it is believed it will—when the revised statistics shall be received by the Provincial Department of Mines, it will substantiate the present tentative claim that last year was a record year for British Columbia in point of total value of its mineral production, the highest previous total having been that of 1907, when official records gave $25,882,560 as the value for that year, in which the quantities of alluvial gold, silver, lead, and copper were larger, while in 1910 lode gold and coal were produced in such greater degree as to more than compensate for the excess in 1907 of the first-mentioned minerals.

In briefly reviewing the progress of production in 1910 the probable misleading tendency of comparisons of value rather than quantity is kept in mind, for since yearly average prices of these minerals the market value of which fluctuates, at times considerably, vary widely in the course of say five or ten years, it is manifest that comparisons of value may fail to exhibit the true condition of an industry in one year as compared with another. However, it happens that average prices for 1909 and 1910, respectively, differ but little, so that in this particular instance the unfairness to one year as compared with the other is unimportant.

The striking decreases in production last year as compared with 1909 were in lead and copper, and in smaller degree in zinc, which last, however, is not yet produced in the province in sufficiently large quantity to greatly affect the year's total of mineral production. The estimated quantity of lead produced in 1910 (37,000,000 pounds) compares unfavourably with that in 1909 (44,396,000 pounds). Again, copper, with an estimated total last year of 39,000,000 pounds, compares with 45,597,000 pounds on official record as the production of 1909. In regard to lead, the chief falling off, it must be frankly admitted, resulted from the practical exhaustion of the known ore bodies in the St.

Eugene mine, East Kootenay, heretofore the largest lead-producing mine in Canada. It is yet too soon to conclude that the present failure of supply will be permanent, for there is, in the St. Eugene group, much ground still unexplored; the present condition is, however, as here shown. On the other hand, the company owning the St. Eugene last year acquired possession of another lead mine, situated in the same division, which yielded sufficient lead to make good the shortage from the St. Eugene. Two mines, in another mining division, however, were also short in their production of lead—together 7,600,000 pounds, which comparatively large decrease was not made up by other mines in the province. In neither of these, though, is the ore exhausted, the stoppage of production for the time having been the result (so it is stated) of dissensions among some of the larger shareholders in the company owning it, and at the other of the destruction by forest fires last summer of the mine concentrating mill and numerous trestles and bridges of the railway that afforded the property transportation facilities. As to copper—the opinion may be expressed that the decrease is more apparent than real, for some copper producers who had previously shown in their annual returns to the Department of Mines the assay value of their ores, gave for 1910 the quantity of copper actually recovered at the smeltery. The material difference in the returns will be evident when it is remembered that one company having an ore production of 1,000,000 and losing five pounds of copper per ton of ore in the slag from the blast furnaces, would necessarily show a difference in production of 5,000,000 pounds of copper. It would seem, therefore, that the 1910 returns exhibit more nearly the actual quantity of copper recovered.

While there was last year an increase of nearly $400,000 in the value of the gold production, this amount is not important enough to call for comment, other than mention of the fact that of this increase $86,000 came from Rossland lode mines, and $190,000 from the Nickel Plate mine, Hedley, Similkameen. The increase in the production of coal is specially noteworthy, though, for the total value of coal and coke for 1910—$11,080,000—was $2,505,000 greater than that for 1909. In this connection, prices used in calculating value are not subject to fluctuation, so the comparison may be taken to indicate correctly increase in quantity of coal produced. Of the net increase—approximately 792,000 tons, after deducting that made into coke—some 468,000 tons is to the credit of four collieries in the Crow's Nest Pass district, Southeast Kootenay, and 324,000 tons to that of six collieries in the Coast district, five of which are on Vancouver Island. The year's gross production of coal, including that made into coke, was approximately 3,119,000 tons (2,240 pounds) as compared with 2,400,000 tons in 1909.

In passing, mention will be made of the fact that several mining companies operating in British Columbia paid dividends in 1910 to their respective shareholders. These were: The Hedley Gold Mining Company, four quarterly dividends at the rate of 12 per cent. per annum, on its issued stock, $1,200,000, total of these payments for year, $144,000; Le Roi No. 2, Ltd, three dividends each of two shillings per share on 120,000 shares, total of these payments £36,000; the Hastings (British Columbia) Exploration Syndicate, Ltd., one dividend of sixpence per share, total of this payment being £1,509 7s. 6d.; the Crow's Nest Pass Coal Company, two dividends, each of one per cent., total amount paid $124,253, and the Granby Consolidated Mining, Smelting and Power Company, one dividend of one per cent., amounting to nearly $150,000. The last mentioned company had at the close of its last fiscal year on June 30th, 1910, about $1,000,000 in cash and unsold copper, but this available credit was held in case it should be required for purchase of new mines, which is the policy of the directors at present. Among others, the Consolidated Mining and Smelting Company of Canada made a net profit in its fiscal year, ended June 30 last, of $309,945, bringing its Profit and Loss account credit balance up to $671,011. and the British Columbia Copper Company's last fiscal year's profit was $204,973, making a total credit of $474,704. Both companies have since made additional profits out of their later operations. As they are adding to their mining property holdings as favourable opportunities to do so are found, and are extending their smelting works, they can not also distribute their profits among their shareholders.

As giving much promise of enlarged operations in the early future, the activity of the larger companies especially is worthy of note. The Consolidated Mining and Smelting Company of Canada, which has large lead and copper smelting works, also an electrolytic lead refinery, at Trail, West Kootenay, in 1910 smelted 445,000 tons of ore and produced gold, silver, lead, and copper of a total value of $5,543,000. This company supplies practically all the refined pig lead used in Canada for the manufacture of lead pipe, shot, white lead, and other lead manufactured products, and as well exports lead to the Orient and Australia. Refined gold and silver are sold to the branch at Ottawa of the Royal Mint, gold to the United States Assay Office, Seattle, State of Washington, and silver to China. Incidentally it will here be stated that in 1910 about 58,000 ounces of gold was sent from British Columbia to the United States Assay Office, Seattle, and this, notwithstanding that there is in Vancouver, B.C., a Dominion of Canada Assay Office.

The Granby Consolidated M. S. & P. Co. smelted about 1,100,000 tons of low-grade copper ore, from its own mines, in 1910. The average of metals recovered from 1,178,853 tons of ore, during this company's last fiscal year, was, per ton: Copper, 18.70 pounds; gold, 0.0370 ounces, and silver, 0.2281 oz. The cost per ton of ore, exclusive of the cost of marketing the product, was $2.50. The British Columbia Copper Co. smelted approximately 456,000 tons, which contained 25,640 ounces gold, 85900 ounces silver, and 7,351,000 pounds copper. Both these companies have large and modernly equipped copper smelteries, with copper converter departments. The blast furnace capacity of the former is 4,000 to 4,500 tons of ore per diem, and of the latter a maximum of 2,600 tons.

The Hedley Gold Mining Company has lately added much new plant, including improved gold-saving appliances, to its 40-stamp mill, and has materially increased its gold-producing capacity.

If space were available much of interest might be added concerning the development of the coal resources of the province, in connection with which there is more activity in new fields, as well as old, than at any previous time. Some idea of the vastness of the coal resources of the province may be given by mentioning that Mr. D. B. Dowling, of the Geological Survey of Canada, in his last-published report (Geological Survey Publication No. 1035, p 33) estimates one coal field only (of the six or eight known fields in British Columbia) to contain 36,600,000,000 tons of coal, as follows:

Elk River Field (Crow's Nest Pass), Southeast Kootenay.

Southern portion, estimated area, 230 square miles; workable seams, 22; workable coal, 22,600,000,000 tons.

Northern portion, estimated area, 140 square miles; workable seams, large number; workable coal, 14,000,000,000 tons.

In conclusion, a few general facts will be stated. The Dominion Department of Mines, every year, sends several parties to do topographical and geological work in the province, and afterwards publishes valuable reports illustrated by sketches and maps. The Provincial Department of Mines, similarly makes investigations and issues official bulletins and an annual report. Dominion officials are now making elaborate investigations and experiments in connection with the reduction of zinc ores of which there is, in British Columbia, a very large tonnage available, awaiting the provision of low-cost smelting or other reduction facilities, to admit of the utilization of these ores at a profit. Mr. F. W. Harbord, London, and Mr. W. R. Ingalls, New York, are engaged in an advisory capacity in connection with these important investigations. Advances in the metallurgy of other minerals are being made. New mining fields are being exploited. More railways are in course of construction, thus opening to industrial activity districts previously lacking necessary transportation facilities. Last, outside capital is being interested with assurance of being given a "fair run for its money."

PORTLAND CANAL MINING DIVISION

(Notes from Preliminary Report by Wm. Fleet Robertson, Provincial Mineralogist.)

The Portland Canal mining division came into legal existence by Order in Council on August 1st, 1910, with the mining recorder's office in the town of Stewart, at the head of Portland Canal. The notice appearing in the Official Gazette of July 21st, 1910, gives the official description of the boundaries of the new division, which may, however, be summarized as "the drainage area of all streams, in British Columbia, flowing into the Portland Canal."

While the history of mining in the district only began this fall, prospecting has been going on steadily and quietly for ten or twelve years, and the district has been twice visited by the provincial assayer, whose reports have been published by this department—the last in 1909—so that the writer confined his attention this season to seeing what had been done on the more developed claims and on those which report credited with more nearly approaching the production stage. The time available for the inspection was limited, and the season at which it had to be made—in October—was so late in the year that many of the claims at higher altitudes were covered with snow, while on others work had been temporarily abandoned for the winter, so that, but comparatively few of the many claims recorded and partially developed could be inspected; consequently this preliminary report must be taken, not as a complete review of the camp, but as an impression gained from a short visit and the inspection of a few claims.

The Portland Canal camp cannot, as yet, be taken as proven, for, although some prospecting has been going on for years, the great majority of the claims have been staked within the past couple of years, and consequently have not and could not have had sufficient development done on them to prove their value. Only two or three of the older claims have done serious development, and of these, at least one property has shown by such that ore is present in quantity and quality sufficient to justify its being called a mine, and to guarantee extraction from present development for at least two years. On other properties where the actual development is slight, the work done by nature has exposed such an amount of mineral as to give considerable hope for future development.

The camp contains a large number of properties from the prospect workings of which exceptionally high assays have been obtained, giving rise to unwarranted hopes and statements which cannot be borne out on a strict examination. The camp justifies reasonable expectations for the development done, without exaggeration by well-intending though injudicious friends whose wild statements nearly "killed with kindness" the best endeavours of legitimate workers.

Portland Inlet, and its inner extension, known as Portland Canal, form a great continuous fiord or arm of the sea, extending from the Pacific Ocean, at Dixon entrance, in a northerly direction for about 110 miles, and so almost penetrating the Coast range of mountains —a granite range which follows the entire coast-line of British Columbia, and extends northwards into Alaska. This is the only arm of the sea so cutting the mountain range, although the range is cut elsewhere by certain rivers flowing westward from the interior, notably the Stikine, Skeena and Fraser Rivers, the latter two having already been utilized as railway locations.

The Portland Canal for its entire length forms the International boundary—the land to the westward belonging to Alaska, while that to the east is in British Columbia. From the head of the canal this boundary-line follows northerly along the summit of the range of mountains between the Bear and Salmon Rivers for a distance of about ten miles, to Mount Dolly; thence striking in a northwesterly direction, crosses the Salmon River some 14 miles from its mouth, leaving the watershed of Bear River and of the headquarters of Salmon River in British Columbia, while the lower part of Salmon River is in Alaska.

The importance of this arm, from a mining point of view, is that it gives deep seawater navigation to, and so renders easily accessible, a district in which granites of the Coast range came in contact with the sedimentary formations lying to the eastward and farther inland. This region of contact extends for the whole length of the Coast range and, from its geological features, forms a zone of probable mineralization, as has been repeatedly pointed out in these reports and is here again emphasized.

The geology of the Bear River district may be generalized as follows, subject to certain exceptions and variations which will be fully demonstrated in the detailed map and report of Mr. R. G. McConnell, of the Geological Survey, who, with a party, spent the summer of 1910 in making a detailed geological study of the field.

The earth-cleft referred to as forming the valley of Bear River was probably accompanied by considerable movement, and, although the line of the cleft is covered by the valley filling, its effect is noted in the contrasting

geological formation of the east and west sides of the valley.

The west side of the valley is essentially and fundamentally of plutonic and volcanic origin, granites on the lower part of the valley, changing to a dark igneous rock— probably a diabase—farther up the river and showing in the wash from the higher elevations, not visited, fragments of volcanic agglomerates.

This igneous mass has been but little cut by dykes, but the diabase is seamed in all directions by small stringers of white quartz, very sparsely mineralized, while at intervals more important east and west cross-fissurings occur, frequently quartz-filled, and sometimes important lenses or shoots of ore occur, as is demonstrated in several partially developed properties.

The geological formation of the east side of the valley is essentially and fundamentally an argillite, a sedimentary deposit, cut by intrusions of greenstone, and numerous dykes, both basic and acidic, are in evidence, the former being the larger and more plentiful, and seemingly the older, the latter the more recent—apparently in places cutting the older dykes, and also the vein-fissures; these latter are probably connected in some way with an underlying granitic batholith, and seemingly are associated with the silicification which is apparently responsible for the mineralization found. The dyke systems and lines of fissuring on the east side of the valley seem to nearly conform to the bedding planes of the argillite, and have a course approximately north and south, or roughly parallel with Bear River valley.

This generalization applies to the valley of the Bear River below American Creek, whether it will be found applicable to the country back of the first range of hills and surrounding the heads of the smaller tributary streams, at altitudes of from 3,000 to 4,000 feet, cannot be stated from personal observation.

On this eastern slope the, at present, more important properties, such as the Portland Canal Mining Company, the Stewart, Main Reef, Jumbo, and many others, lying south of Bitter Creek, seem to be all located upon the one general zone of fissuring, which is continuous for at least four or five miles, and in this the veins are found. Sometimes the vein formation is represented by a single quartz vein, while farther along it presents four or more veins; the transition from one to more veins is not shown by the work done, nor yet is it exposed by the valley of Glacier Creek, which cuts across and into the formation to a depth of some 1,500 feet, although the latter does demonstrate the veins to continue to that depth. At the present stage of prospecting and development this one main zone of fissuring seems to contain all the more important ore showings, although it is premature to conclude that it is the only zone on the hillside.

While this general fissure continues, as stated, for such a great distance, and the vein formation in it is at least seemingly continuous, as far as demonstrated, the veins being more or less mineralized throughout, still it does not follow that for all this distance the mineralization is sufficiently intense to form profitable ore; such could not be expected and does not occur, but there are parts in these veins in which the amount of mineral in the vein occurs in sufficient quantity to render it workable ore. It is as yet too early in the development to say whether the ore occurs in shoots, chimneys, or some other form, but the tunnel workings of the Portland Canal Mining Company have demonstrated that the "pay-ore," first proved on the surface, extends downward along a defined "pitch" which would seem to mark the northern end of an ore shoot, while the tunnels have not as yet at their faces reached the limit of the body of "pay-ore" to the south. By the term "ore shoot" it is not intended to imply a body of solid ore, but a portion of the length of the vein sufficiently heavily mineralized to be profitably workable.

The chances are that mineralization, generally similar in character ,although varying as to quantity, occurs throughout this main fissure. The character of this mineralization is best demonstrated by the actual extraction of the only producing mine — the Portland Canal Mining Company's—described later, and may be summarized briefly as iron-sulphides carrying gold and silver, galena carrying silver and some gold, and a small quantity of zinc-blende carrying small silver and still smaller gold values. These are essentially the ores upon which the values of the properties will probably be based, although, particularly in the upper or surface workings, specimens of exceedingly rich silver-sulphides and oxides, with also native silver and possibly gold, have been found.

In the opinion of the writer, this portion of the camp will be comparatively low-grade concentrating propositions from $10 to $20 ore, the high-grade minerals being difficult to concentrate and not sufficient in quantity to dispense with this process.

Shipping Facilities.

Seldom in British Columbia has the truth been so clearly demonstrated as at Stewart that the value of an ore-body is dependent upon the faculty of getting its contents to market and still more seldom have the facilities been so quickly obtained. Portland Canal affords a land-locked waterway by which any vessel may approach the town of Stewart where the tidal mud-flats offer proper holding-ground for pile wharves; this has been taken advantage of and a pile wharf with a pile approach from the shore a mile long, is now nearing completion; while a local railway company has built a splendid railway dock and approach, over a mile long, and has equipped it with standard-gauge tracks. The same company has about completed a railway grade up the valley of Bear River to the mouth of American Creek—a distance of approximately fifteen miles— and could, should it desire to push matters, easily have the rails laid over this length before snow falls. A locomotive and a number of cars are now on the ground ready for use, and rails have been laid from the landing as far as the railway-station.

The valley of Bear River on the flat will average about half a mile wide, being rather more than this near its mouth; its course is nearly straight, and it rises at an almost uniform grade—about 500 feet in 15 miles. The valley bottom is gravel, permitting of cheap railway construction, while the first nine miles of the railway grade contains one tangent of four and a half miles in length and many shorter ones. The hills rise abruptly from the valley, affording the best of opportunities for aerial tramways, with ample room on the flat for requisite mill-sites.

The tributary streams are all too steep to admit of railway construction up them; an exception to this rule is, however, presented in Bitter Creek, up which a railway might easily be built for a distance of from six to seven miles, or possibly to the foot of the glacier, with aerial tributaries from the side creeks. Bitter Creek valley is really a branch extension of the river valley, and is similarly filled with detritus from the glacier. The Provincial Government has built a waggon road, with necessary bridges, from Stewart up the river val-

ley, as far as and across Bitter Creek, over which two stages travel daily each way. A further extension of this road as far up as American Creek, including a bridge across Bear River, was under construction this autumn and promised to be completed before snow falls.

Steamer service is maintained from Seattle, Victoria, Vancouver, and Prince Rupert twice a week by the G.T.P. Railway, their fine boats having gone right through to Stewart during the summer months, but in the winter a transfer of passengers and freight is made at Prince Rupert to a small steamer, which serves as a tender to the larger ones. The Union S. S. Company runs its steamer "Camosun" from Vancouver through to Stewart direct without transfer, making a round trip each week. Besides these regular steamers, several coasting and freight boats make Stewart a place of call but at irregular intervals.

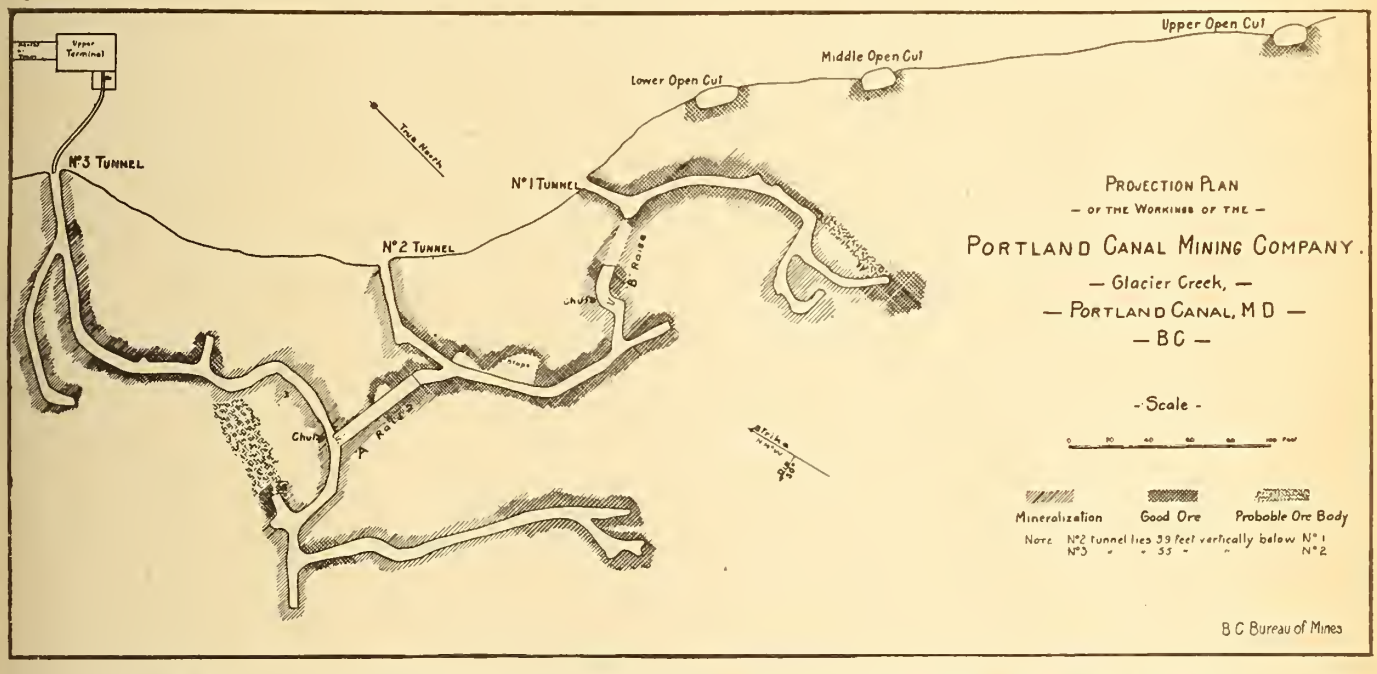
Portland Canal Mining Company.

Interest in the Portland Canal Camp at present naturally centres in the operations of the Portland Canal Mining Company, N.P.L., since the development of this company's property is the furthest advanced and it is the only company as yet in a position to make shipments. The company is a local organization, with head office at Duncan, V.I., the president being Mr. C. H. Dickey, of Duncan. The capital of the company is $1,000.000, divided into shares of a par value of 25 cents. The operations of the company at the property are in charge of Mr. W. J. Elmendorf as engineer and general manager, with Mr. N. C. Sheridan as mine superintendent, while Mr. Otto Abeling has been responsible for the construction and equipment of the concentrator. The company owns some twelve claims and fractions, viz.: Gipsy, Extension, Herbert, Mayflower, Mosquito, Richard II., Barney, Sadie, Eclipse, Little Joe, Little Joe Fraction, and Lucky Seven, all adjoining and situated on the hill forming the eastern slope of Bear River and the southern slope of Glacier Creek valleys. Serious development work has as yet been confined to the Lucky Seven and Little Joe mineral claims.

As has already been noted, the mineralization on these claims is along the line of a great fractured zone which runs in a general north and south direction, about parallel with Bear River, not only for the length of this group of claims, but continues, both to the north and south, through a number of other claims. This zone is of variable and not clearly defined width, but is in places several hundred feet across, and runs through an argillite formation, conforming, at least very nearly, to both the strike and dip of the argillite. Within this zone the argillite has been more or less crushed, and presents, when cemented together by the quartz-vein matter, a brecciated mass. Within this zone there are a number of comparatively small felsitic dykes, running with the fissure, apparently injections after the formation of the fissure, and these dykes seem to be present wherever important mineralization has taken place. Through this general zone of crushing, siliceous infiltration has taken place, the solution naturally following certain channels which the crushing had rendered more open—lines of least resistance to the flow of the solution —and these channels of silicification now form the quartz veins in which the mineral is found.

On the Lucky Seven and Little Joe the silicification seems to be confined to one main vein, as far as present development shows. In the earlier stages there were supposed to be two veins, but the management now considers the second vein as merely an offshoot of the main vein.

Mine.—The mine workings are at an elevation of about 2,400 feet above sea level, and consist of three



tunnels with connecting raises, as shown on accompanying plan.

The lowest, or No. 3 tunnel, is the working tunnel, the tramway therefrom going directly to the bunkers at the upper terminal of the aerial tramway. This tunnel, in October, 1910, was in about 500 feet, and follows in on the vein, which is mineralized all the way; but what is considered pay-ore was only struck at about 100 feet in, from which point it apparently continues to the face, although the tunnel in a couple of places seems, in the driving, to have run away from the ore. From this level a raise has been put up to the No. 2 tunnel, and this acts as an ore-chute from the upper levels.

The No. 2 tunnel is about 55 feet vertically higher than No. 3, the vein dipping at an angle of about 30 degrees, and was in about 200 feet, with a raise being put up to the No. 1 tunnel, and which, in October,

was almost through. At about 25 feet in from the portal the tunnel entered on pay-ore, in which it has continued to the face.

The No. 1 tunnel is about 40 feet higher than No. 2, and has been driven about 180 feet and developing pay-ore for its entire length, the face being in such ore. At one point in the driving the tunnel was deflected to the right and ran out of the ore-shoot, but, upon being brought back to the original course, picked up the ore again.

Above the No. 1 tunnel several open cuts, sunk on the outcrop, have disclosed pay-ore, indicating that this ore shoot continues for at least 350 feet to the south of the portal of No. 1 tunnel. The development work on this ore-shoot, as stated, would seem to indicate an ore-shoot at least 350 feet long, developed below the outcrops, along the plane of the vein for a distance of about 400 feet; the thickness of the pay-ore has been estimated by the management as averaging about 5 feet; this figure being, in the opinion of the writer, under the mark, rather than over it. Should the ore-shoot prove to be as long in the tunnels as the open cuts directly above them seem to indicate, this would argue an amount of ore, from present development, sufficient to keep the present mill busy for three years. The faces of all the tunnels were found to be in ore which was apparently richer than the average of the ore-shoot.

The monthly average assay for September of the face of No. 2 tunnel is reported as being: Gold, $5.20; silver, 61 ounces; lead, 2.5 per cent.; and of face of No. 3 tunnel, about, gold, $4; silver, 15 ounces; lead, 4 per cent. These values vary from month to month, and are quoted merely as an indication of the grade of ore met with.

The ore mined and milled consists of iron-sulphides and galena, both carrying gold and silver, with a small quantity of zinc-blende and occasionally some copper pyrites, all contained in a quartz gangue and mixed with fragments of argillite.

Specimens of the higher sulphides and oxides of silver and of metallic silver are frequently seen in the vein in all the levels, and, though of interest, are not taken into account by the management, nor is any special attempt made to save them. The mine depends entirely on the iron-sulphides and galena for its ore values, which are stated to be in the neighbourhood of $12 a ton of ore. The ore is conveyed from the mine to the mill by an aerial tramway of the Bleichart system.

All mining has as yet been hand drilling, but the company was engaged in laying, and had nearly completed, a pipe line from the mill to the mine for the conveyance of compressed air, and when this is completed an equipment of power drills will be installed in the mine. The compressor was on the ground all ready to be set up at the mill, where it will be driven by water power.

The mine is provided with good and substantial cook and bunk-houses and other buildings, including a house for the mine superintendent.

The development accomplished by the mine workings covers but a small part of the main fissure contained within the company's property, in other portions of which important surface showings of ore have been found, but these have, for the time being, been left dormant, pending the development in the mine workings.

Of these minor developments, one, however, deserves special mention; it is located some distance, about 1,000 feet, to the north of the mine workings and on the same vein, but, owing to the contour of the hill, at a considerably lower elevation, and is so situated that ore mined there could, with slight expense, be delivered to the present tramway for transmission to the mill. At this point the main vein outcrops strongly and is heavily mineralized; it is further developed by a short tunnel in which the mineralization of the vein is satisfactory. This development would seem to indicate another ore-shoot, easy of exploitation, but requires further development to show its extent and ultimate value; it, however, gives ground for the belief that between this point and the mine other ore shoots will eventually be developed.

Mill.—The company had, in October, just about completed a concentrating mill for the treatment of the ores from the mine; this mill is situated in the Bear River valley, at the mouth of Glacier Creek, the lower terminal of the aerial tramway being some 2,200 feet lower than the upper terminal. The mill building is a substantially framed structure, sheathed with double boarding with paper between, built on the lowest slope of the hill. The mill consists of a receiving chute capable of holding 75 tons of ore and a bin holding 175 tons. From this latter the ore is fed through a challenge gate to a 6-inch by 16-inch Sturtevant crusher, which reduces the ore to 1-inch size. The crusher discharges on to a rubber belt conveyor, set with a slight fall, which conveys the ore to another bin holding 175 tons of crushed ore. From the crushed ore bin the ore is fed by an Allis-Chalmers roll-feed automatic feeder to a set of slow-running Allis-Chalmers 12-inch by 24-inch rolls, from which it passes to No. 1 elevator is thus raised to the top of the mill, and is discharged into a revolving trommel, with 5 mm. screen. The oversize from the trommel is returned by a chute to the second rolls, the discharge going to a second trommel which is fitted with two panels of 2 mm. screen and one panel of 3 mm. The oversize from this trommel goes direct to 5 mm. jig, and the 3 mm. screenings to the 3 mm. jig. The 2 mm. screenings go to a classifier, which separates out the 2 mm. and 1 mm. sizes, which go respectively to the 2 mm. and 1 mm. jigs, while the overflow passes on to four suspended iron conical settlers, which in turn distribute their product, the first to a Wilfley table, the second to an Overstrom table, and the third and fourth each to a Frue vanner. The overflow from these settlers passes on to a series of large settling tanks on a lower floor. The middlings from the 5 and 3 mm. jigs go to the second, a finer, set of rolls; thence to the second elevator. The middlings from 1 and 2 mm. jigs go to a 10-foot Lane mill, and after recrushing, pass on to No. 2 elevator.

All these recrushed middlings are then elevated to the top of the mill and discharged into a third trommel, the oversize from which is returned for recrushing, and the screenings go to the classifier, so entering the process again. The tailings from all the jigs and tables, being sufficiently clean, go to the tailings-dump. The concentrates from the jigs and tables discharge by gravity into receiving bins on the lower floor.

The capacity of the crushing, screening, and elevating part of the mill is 100 tons of ore a day; the installation of jigs and tables now in place is for 50 tons only, but provision has been made for doubling this as soon as it is required, so that, while now the mill as a whole has a nominal capacity of 50 tons, this could be doubled at a comparatively small expense. In the construction of the mill the very best and most

efficient construction has been employed, and the machines are of the most modern type.

To accompany this report a flow sheet has been prepared to show graphically the process of concentration employed.

An electric light dynamo to be driven by water-power was being installed, which would light the mill and other surrounding buildings.

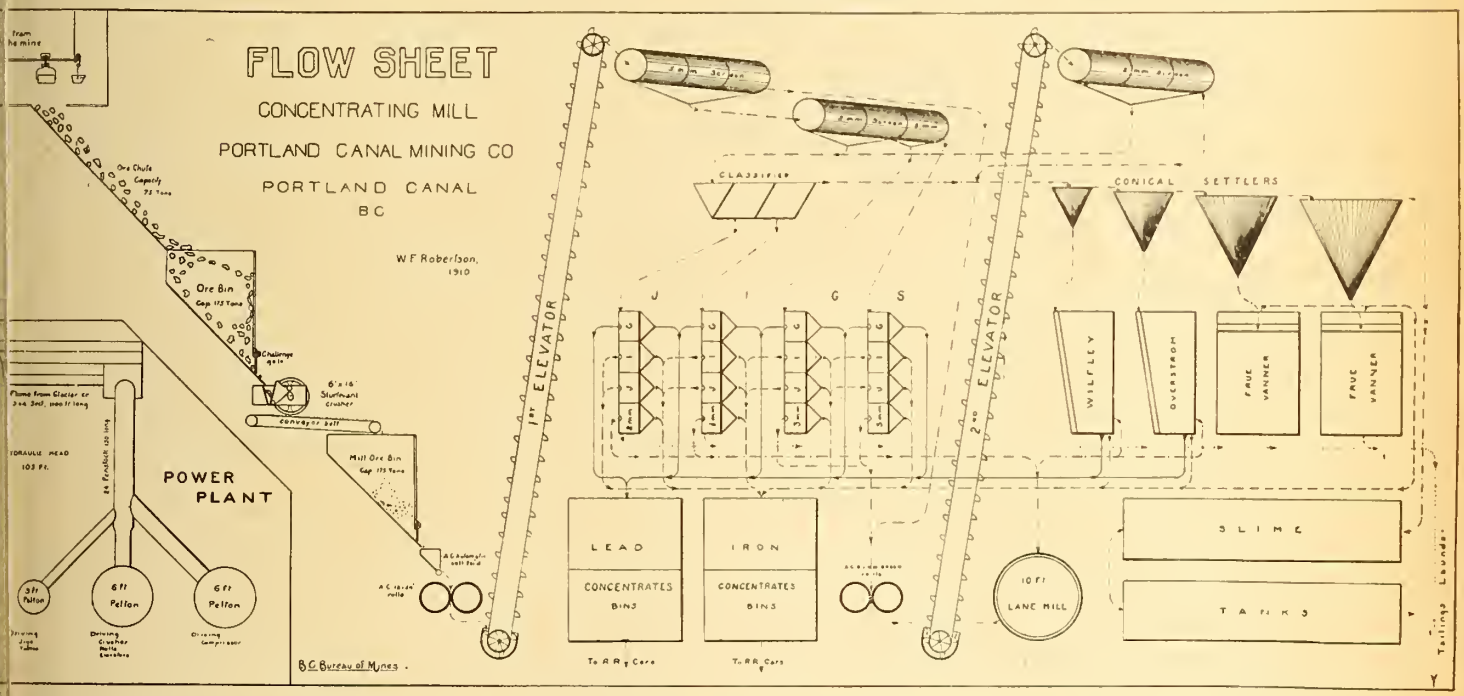
Concentration Effected.—The concentrating plant was only started about October 1st, and when visited by the writer, some ten days later, was only being "tuned up" on a low-grade feed, so that no definite results as to the ultimate percentage of saving, the average assay of tailings, or the rate of concentration could be obtained. The work being done, therefore, represents only the "first try," and, as this was good, better results may be expected after adjustment.*

The rate of concentration will be approximately from 3 to 3 1-2 tons of ore into 1 ton of concentrates; these concentrates consist of iron sulphides and galena, collected separately, in what proportion is not yet definitely demonstrated, but a very clean separation between the two was being effected.

concentrates—gold, from $8 to $10; silver, 15 to 20 oz. per ton. Lead concentrates—gold, from $8 to $10; silver, from 35 to 45 oz. per ton; lead, from 65 to 75 per cent. No zinc concentrates are saved, as they were found by actual test to contain but low assay values in silver—about 1½ oz. to the ton.

The slime-tanks were not at that time in operation, so that it is not as yet known whether any saving will be made of the small quantities of higher silver-sulphides and oxides which are visible occasionally in the ore and which, from their nature, would slime.

POWER PLANT.—The company owns a water record on Glacier Creek which has been developed to supply all the power necessary for the mine and the mill. The water is taken out of the creek canyon at the head of a fall, the intake being well protected by projecting rock from any drift-wood or drift-ice. The intake is for the first few feet in solid rock, when the water enters a flume 3 feet deep by 4 feet wide, built of 2-inch plank with battens, laid on a grade of 1-inch fall in 4 rods. From the intake to the pressure-box the flume is 1,100 feet long; it follows down the north side of the creek for some distance, when it crosses over to the south side



The tailings from each of the machines contained but small values in gold and silver, even with the incomplete adjustment, showing that the process was satisfactory, the separation of the mineral from the gangue being easily and very completely effected.

The separation on the Wilfley table was very nearly theoretically perfect, the lines of galena, iron-sulphides, zinc-blende, and tailings on the table being the most clearly defined that the writer has ever seen.

The concentrates being made, from the class of ore being experimented with, ran about as follows: Iron

*A letter from the general manager to the president of the company, dated Nov. 22nd, received as this goes to press, places the mill feed at that time as about: Gold, $3; silver, 14 oz. to the ton; lead, 3.7 per cent.—about $13 ore. "Our extraction at this time is about 80 per cent., but with the Lane mill in operation and several small changes, now completed, we will raise this to 85 per cent., and I think ultimately to 87 per cent."

on a trestle 100 feet above the creek-bed. The pressure-box is 105 feet above the Pelton wheels, to which the water is conveyed in a wrought-iron penstock 24 inches in diameter and 150 feet long, with suitable branches and valves. The power is developed by two 6-foot and one 3-foot Pelton wheels. One 6-foot wheel drives the main counter-shaft from which is belted the crusher, rolls, Lane mill, and conveyors; the other 6-foot wheel was being held for the compressor. The 3-foot wheel was used exclusively for the jigs and tables, thereby obtaining a steady and constant motion for these machines.

OTHER BUILDINGS.—The company has erected near the mill a large and very complete boarding-house, kitchen, dining-room, sitting-rooms, and bedrooms for the men; there is also a well-equipped laboratory building with rooms for the assayers. The office contains public and private office rooms and living quarters for the manager. Stable, blacksmith, and carpenter shops have been planned out and will be erected at an early date.

TRANSPORTATION.—The Portland Canal Short Line Railway has laid out a spur from its main line to directly in front of the concentrator building, so that ore will eventually be loaded direct from the mill into the cars.

In addition to this, there is from the mill a good Government waggon-road to the town of Stewart, distant about three miles and a half; this road is practically level and has a good hard gravel bottom.

All supplies for the mine are received at the mill and taken up on the aerial tramway.

The mine office and various mill offices are conneeted by telephone and also with an office in Stewart.

Stewart Mining and Development Co.

The Stewart Mining & Development Company has eight or nine claims on the north side of Glacier Creek at an altitude of about 1,000 feet. The company has been at work for the past three years steadily developing its property by means of tunnels, etc. There has been a great deal of surface work done as well, but this becomes of secondary importance since general zone of crushing or fissure upon which the Portland Canal mine ore-body is located passes northward, through the intervening properties, into and through the Stewart claims. In such a crushed zone the mineral-bearing solutions would follow the lines of least resistance, and while in the Portland Canal property these solutions appear to have been confined to one channel, producing one vein, in the Stewart they appear to have produced four veins, all parallel as to strike, though not as to dip, and all contained within the zone of fraeture, which here has a width of about 400 feet.

From Glacier Creek northward, following the fracture zone, there are a couple of deep and precipitous-sided gulches extending up as far as the eabins of the Stewart Mining Company. In the sides of these gulches Nature has caused exposures of the veins, so that but little work had to be done to prove their general conditions. From the bottom of the deepest of these gulches, on the George E. claim, the company has driven a crosscut tunnel to the east, into the bank, for a distanee of about 300 feet, and in so doing has crosscut three veins, known locally, in order of sequence, as No. 1, No. 2, and No. 3 veins—the last being also called the "Green Vein" or "East Vein." The No. 1 vein was struek at 50 feet in, and on this a drift was run to the right for 60 feet, but does not determine the full size of the fissure or vein, which, however, is more fully exposed in a series of cuts higher up the very steep hillside, and there seems to be a well-defined quartz vein, 2 feet to 4 feet wide, and dipping to the west at an angle of about 55 degrees. The vein contains some heavy sulphides of iron, carrying gold values, but no large body of ore has been encountered.

At 100 feet in from the portal of the tunnel the No. 2 vein was cut, and has been drifted upon for 60 feet on either side of the tunnel. The fissure of this No. 2 vein is from 6 to 7 feet wide, and shows a quartz infiltration and replacement of the fractured argillite carrying more or less mineral.

At 300 feet in from the portal, and 150 feet from No. 2 vein, the No. 3 vein was cut, and its general fissure is about 25 to 30 feet wide, while the dip is nearly vertical. In this vein a drift had been made to the right for 50 feet, while to the left one had been driven for 200 feet, and was still being pushed forward, receiving the greater part of the attention of the management; several crosscuts had been put off from the drift at various points to test the width of the fissure. This vein is similar in general character to the others, but in addition to the quartz-gangue matter there was apparent a considerable quantity of calcite. There were some sulphides visible in the vein-matter, but no commercial body had as yet been struck. There were, however, numerous showings of native silver and of the higher silver-sulphides, which, although they gave great encouragement to the management, were not sufficiently plentiful to constitute ore.

On the west side of the gulch, directly opposite to the mouth of the crosscut tunnel already mentioned, No. 4 vein has been opened up by a tunnel driven in along the vein for some 200 feet. This is a large strong vein and seems to earry a greater percentage of heavy iron-sulphides than was then visible in any of the other veins. This vein dips to the west at a flatter angle than the other veins, and the mineralization more nearly approaches in character that found on the Portland Company's property, giving rise to the belief that this vein is the continuation of the Portland vein. This belief, however, lacks definite confirmation, and it is not at all improbable that all the veins are equally continuations of the Portland vein.

Portland Wonder.

The Little Wonder mineral claim, being developed by the Portland Wonder Mining Company, is situated to the south of the eastern portion of the George E. claim of the Stewart Mining Company, and contains within its borders a continuation of the No. 3 vein of the Stewart, which here also is found dipping nearly vertical and is easily traced from the Stewart down Lucky Gulch from Claeier Creek and at an altitude of 700 feet above sea-level; the No. 2 tunnel has been driven in for about 360 feet, of which the first 150 feet is through slide material. Practically all the work is now being done in this tunnel, from whieh a raise has been put up to the old workings on No. 1 tunnel.

The vein here is very similar to the same vein on the Stewart, but seems to have been subjected to a severe disturbance and crushing, subsequent to the formation and deposition of the ore in the vein, since small masses and lenses of solid iron-sulphide are encountered showing straight parallel striæ, which have been crushed by movement into small lenses covered with "slicken-siding" and occurring in a mass of broken and polished graphite argillite. This latter movement would appear to be local in eharacter and has so disturbed the vein in the present workings that little can be definitely said about it, beyond the fact that the amount of solid sulphide present in the crushed vein-matter gives reasonable hope that when the erushed portion of the vein has been passed, a more than usual amount of sulphide ore may be looked for.

The development was being earried on by a force of eight men, with Mr. McCrimmon as foreman. Comfortable eabins had been erected, whieh would enable work to be carried on during the winter. On the dump at the mouth of the tunnel there was a pile containing a number of tons of solid sulphides of iron and lead, from which a rough sample was taken which assayed: Gold, $16.80; silver, 19.4 oz. to ton; lead, 36.5 per cent.

Lulu Mineral Claim.

The Lulu mineral claim lies south of the western portion of the George E. claim, and undoubtedly contains within its borders some of the veins developed on the Stewart property, but the development has not as yet proceeded far enough to demonstrate what they may there contain. A erosscut tunnel is being driven in from a small gulch, with the intention of crosscutting the ledges, and had proceeded some 180 feet.

Minutes of Organization Meeting, International Geological Congress.

At the instance of the Director of the Geological Survey, a meeting of Canadian geologists and mining engineers was called for December 2nd, at 11 a.m., in Toronto, to arrange for the Twelfth International Geological Congress, which is to be held in Canada.

There were present Dr. F. D. Adams, Mr. J. C. Murray, Mr. O. E. LeRoy, Mr. H. Mortimer Lamb, Mr. J. A. Bancroft, Prof. E. Dulieux, Dr. T. L. Walker, Prof. M. B. Baker, Mr. J. B. Tyrrell, Mr. James McEvoy, Dr. W. G. Miller, Dr. W. A. Parks, Mr. J. McLeish, Dr. A. P. Coleman, Mr. R. G. McConnell, Mr. O. N. Scott, Mr. W. McNeill, Mr. W. S. Lecky, Mr. R. W. Brigstock, Mr. G. G. S. Lindsey, Mr. F. Loring, Mr. A. A. Cole, and Mr. R. W. Brock.

Dr. Adams was chosen chairman of the meeting, and Mr. R. W. Brock secretary.

Dr. Adams called the meeting to order and explained the object. On motion of Dr. Miller, seconded by Dr. A. P. Coleman, it was decided that the Congress should be held in Canada in 1913, this date being chosen on account of the British Association meeting in Australia in 1914, and possibly the Winnipeg Exposition in Canada, also in 1914. The meeting then proceeded to elect officers for the Congress.

On motion by Dr. Miller, seconded by Dr. Coleman, Dr. Adams was elected President. Dr. Coleman moved, and Mr. James McEvoy seconded, that Mr. R. W. Brock be elected Secretary. Dr. Miller and Mr. Tyrrell suggested that the offices of Treasurer and Secretary be combined. This was included in Dr. Coleman's motion, and the motion thus amended was carried. On account of the great amount of work which would be necessary to make the meeting a success it was decided that a paid Secretary or Manager should be appointed to assist the Secretary and Executive Committee.

The question of committees was then discussed, but it was decided that before these could be formed it would be necessary to decide upon the place of meeting.

Dr. Miller moved, seconded by Dr. Parks, that the Congress be held in Toronto. This motion was carried.

In the discussion, the point was brought out by Dr. Walker that local meetings might be held in the east and west as well as the main meeting at Toronto. This suggestion met with the approval of the meeting.

The discussion regarding committees was then resumed. In the course of the discussion it was brought out that a large honorary committee, a large general committee, local committees, and an executive committee would be necessary. As a great deal would depend upon the careful selection of these committees, it was decided to appoint a small executive committee who could spend some time and thought on the selection of the other committees. It was moved by Dr. Miller, seconded by Mr. LeRoy, and carried, that the President, Secretary, Dr. Coleman and Mr. Tyrrell should be appointed a committee to recommend to this meeting names for an executive committee. It was moved by Dr. Miller, seconded by Mr. McEvoy, that Dr. Coleman and Mr. Tyrrell be members of the executive committee. The committee nominated then retired, and after fifteen minutes' consultation recommended the following names as an executive committee: F. D. Adams, R. W. Brock, A. P. Coleman, W. A. Parks, G. G. S. Lindsey. The convener pointed out that the names were confined to persons living in the central part of the country on account of the necessity of the committee meeting at frequent intervals.

It was moved by Mr. Cole, seconded by Mr. McEvoy, that the gentlemen recommended be appointed an executive committee of the Geological Congress, with power to add to its members. Carried.

Dr. Walker moved that the general committee, honorary committee and any other committees that might be found necessary be appointed by the executive committee. This was seconded by Mr. M. B. Baker and carried.

Dr. Walker moved, seconded by Dr. Miller, that the executive committee be authorized to appoint vice-chairmen of committees who could act in case of the absence of the chairman.

An informal discussion then took place regarding the excursions which it was felt should be the main feature of the Congress in Canada. Various suggestions were made and it was decided to have the members consider this question carefully and send their suggestions to the executive committee, who would go thoroughly into the matter.

On the question of major subjects for the Congress it was felt that it might be advisable to get up a special memoir on Coal, similar to the one on the Iron Ores of the World, prepared for the past Congress, as this subject would be supplementing the Iron Memoir.

The Secretary stated that Dr. J. G. Anderson, Secretary of the Eleventh Congress, had called attention to the fact that the Congress had accepted the proposal of Dr. Hobbs that an international inquiry on the subject, "The Fracture System of the Earth's Crust." should be undertaken; that Congress in accepting this proposal expressed its opinion that the manner employed by the Swedish executive committee when undertaking inquiries on the iron ore resources and the post-glacial climates, could serve as a model to the coming executive committee of Canada when organizing the proposed enterprise, and charged the named committee to arrange the matter together with Dr. Hobbs.

The subjects for the Congress were left to the executive committee.

The meeting then adjourned to attend a lunch given by the Toronto branch of the Canadian Mining Institute.

Ore Dressing--Coniagas Concentrator.

(Written for the CANADIAN MINING JOURNAL by Fraser Reid.)

[Editor's Note.—This succinct account of concentrating practice and results at the Coniagas mine will repay careful study. It is the product of much thought and experimentation. The treatment of slime is an outstanding feature.]

The minerals of economic value in the veins and wall rock of the Coniagas mine are native silver, argentite, parargarite (ruby silver), smaltite and niccolite.

The argentite is confined usually to the contact of the conglomerate with the Keewatin, while the parargarite occurs in the form of a drusy coating, or wash, in the wall rock of some of the workings.

The specific gravity of the vein matter varies from native silver sp.g. 10.5, to calcite sp. g. 2.7; intermediate

specific gravities being regulated by the combinations of native silver, calcite, smaltite and niccolite.

The veins vary in physical properties from the solid well-defined and more or less easily recoverable, to the decomposed, in which the smaltite or niccolite has suffered oxidation, the native silver being unaltered and in forms similar to that in the solid veins, i.e., from the finely disseminated and invisible to the dendritic and massive.

Values occur in the wall rock in the form of stringers, leaf silver and finely disseminated mineral. The finely disseminated mineral, along with the fine leaf and ruby silver in the wall rocks, makes hand sorting of waste impracticable.

The flow sheet accompanying this gives details of treatment. The principal features of the mill are:—

1. The hand sorting of oversize of one and one-quarter inch rings, the tailings from sorting belt going di-

rect to stamp bins. By this method the process is simplified, hand sorting in the mine is greatly reduced, and flake silver and silver in gangues of low specific gravity are sorted out, whereas in jigging, values in this form are liable to go over with the tailings. Attritional losses are also greatly reduced.

2. The original slime from the mine is cut out in the initial stage and piped direct to settling tanks, the product running from 115 to 175 ounces of silver to the ton. This process takes care of the decomposed vein matter.

3. The stamp discharge is thickened in 3-foot cones, the unclassified product going direct to No. 2 Deisters. The tailings from the No. 2 Deisters go to a Drag Classifier, the clean sand going to waste and the slimes pumped back and retreated on No. 3 Deister Slimers. By this method the slimes are reduced in value from about 20 to 12 ounces of silver before treatment on slimers, the sands on panning show very little, if any, free mineral, and the concentrates from No. 2 Deisters range from 1,800 to 2,200 ounces silver.

The sand tailings vary from 2 1-2 to 5 1-2 ounces silver, and vary directly as the nature of the wall rock treated. Ore from some of the workings crushed to 16-mesh and treated on tables, will give a 2 1-2 ounce sand, whereas ore from other workings would require to be crushed to 60-mesh to produce tailings of the same low value.

The slime tailings vary from 6 to 8 ounces silver, depending on the value of the feed to final treatment tables—the slimers making an extraction of from 40 to 50 per cent.

Recommendations as to Mining Legislation

(Submitted by the Special Committee of the Canadian Mining Institute.)

A committee of the Canadian Mining Institute consisting of G. G. S. Lindsey (Chairman), T. B. Caldwell, Lanark; Colonel A. M. Hay, Haileybury, Clifford E. Smith, Brockville, and J. L. Retallic, Kaslo, was appointed on the 1st of March to visit Ottawa and urge upon the Government that the recommendation of the Select Standing Committee of the House of Commons, on Mines and Minerals, dated Tuesday, the 18th day of May, 1909, be carried by the Government into effect.

The recommendation of the Select Standing Committee was as follows:—

"Your committee is of the opinion:—

"(1) That there should be assigned to the Mines Department the administration of mines, including the issue of title thereto, and of all mining laws.

"(2) That an Act should be passed consolidating all the laws relating to mines under Federal control.

"(3) That consideration should be given to a policy which will have for its object the re-acquisition by the Crown of mining rights heretofore granted in patents of land."

The Prime Minister appointed Monday, the 21st day of March, 1910, at eleven o'clock, to hear the committee, at which time all the members were present, except Mr. J. L. Ratallic, who had not sufficient length of notice to enable him to be present.

Mr. James Conmee, Chairman of the Select Standing Committee, introduced the committee, with Mr. H. Mortimer Lamb, at whose request Professor Willmott, F. T. Congdon, M.P., and Ralph Smith, M.P., were also present. Besides the Prime Minister, the Hon. Wm. Templeman and the Hon. Chas. Murphy received the committee. After the matter had been presented by Mr. Lindsey, Chairman of the committee, and spoken to by other members, the Minister of Mines gave his hearty endorsation to the proposal, and Sir Wilfrid Laurier promised that the first and second recommendation of the Select Standing Committee would be put into effect, and urged the Institute to prepare a statute consolidating all the laws relating to mines under Federal control, on the promise that the Government would introduce it at the next session of the Dominion Parliament.

At half-past three o'clock the same afternoon, at the request of the Minister of Mines, the committee waited upon him, when it was agreed that the Select Committee of the House would be called together immediately, a sub-committee appointed to draft the Act consolidating the mining laws, and an appropriation obtained so that the sub-committee might have the opportunity of dis-

G. G. Lindsey, K.C.

cussing with representative mining men from every province of the Dominion, the principles and details of the statute, so as to enlist their co-operation and support, and in this way secure a statute which would commend itself to as many provinces as possible, and possibly be followed by them in legislation for their own provinces.

On the 12th of April the report of the committee to the Institute was adopted, the committee was asked to continue to serve, given power to add to its number and full authority to act on behalf of the Institute, and was also empowered to take such steps as they might deem expedient in the premises.

The House of Commons did not appoint a sub-committee or take any further steps in the matter before rising. This having been brought to the attention of the Council of the Institute on the 7th of October, the committee was enlarged by the addition of the gentlemen who served on the previous committee appointed in 1909—Dr. A. E.

Barlow, Messrs. J. B. Tyrrell, B. A. C. Craig, J. M. Clark and A. B. Willmott, and this enlarged committee was empowered to draft certain recommendations to constitute the basis of a mining law for submission to the Council at its next meeting in December.

The enlarged committee met and prepared the following recommendations, and asked that a special meeting of the Council consider the same, which was done on the 11th of November, when the report was adopted, with the exception of Paragraph 5, which was changed.

The Secretary then submitted the committee's report, as follows:—

Report of Committee on Mining Legislation.

The committee of the Canadian Mining Institute, appointed to recommend a basis of a mining law for the Dominion for the purpose of submission to the Council of the Institute at its next meeting in December, respectfully submits:—

1. That the title to be required should be lease for 99 years for all purposes.

2. That the rental should be based upon the acreage and paid in advance at the rate of $1.00 per acre per annum.

Work done on any claim to the extent of the rental, but only where the work done amounts to at least $200 in any one year, is to be received in lieu of rental for that year.

3. That, in addition, royalties at the rates at present provided be paid, (it to be made clear what the general clause in regard to royalties in the existing statute means).

In the case of coal the present royalty, 5c. per ton (2,000 lbs.) should prevail up to the year 1930 (this date is given because the existing 21-year leases based on a 5-cent royalty expire at that time), and after 1930, and up to the end of the present century the royalty should be 10c. per ton.

Note:—Existing lessees should be permitted to exchange for lease under the new statute.

4. The prospector is not to be obliged to make discovery of mineral in place to the satisfaction of anyone, but having made what, by him, is believed to be a discovery of mineral in place, he is to be permitted to stake out a claim of 52 acres on the ground, and then record it in the Government Recording Office at a nominal fee, on doing which a lease is to be issued to him, which lease is to be perfectly free from any conditions dependent on the opinion or reports of officials.

5. There shall be no license fee or permit required for prospecting on the domain of the Crown.

6. Conformably with the promise of the Prime Minister there should be assigned to the Mining Department the Administration of Mines, including the issue of title thereto, and the making of all mining laws.

On motion of Mr. Donnelly, seconded by Mr. Penhale, it was also decided to delete paragraph 5, and substitute therefor the following:—

5. "A license fee shall be required of persons applying for the lease of mining lands from the Crown, and a prospector must either obtain a license to prospect before going into the field, or qualify before recording a claim."

The following resolution was passed:—

In addition, the Council requests the committee to submit the report to the Minister of Mines and to request him to provide a grant of money to cover the cost of drafting the Act in accordance with the suggestion made to the committee by the Prime Minister.

At the luncheon held by the Toronto branch on Friday, the 2nd, the usual discussion at such meetings was upon the recommendations of the committee as approved by the Council, and these were unanimously adopted and the committee was requested to press through legislation during the present session of the House.

The committee have an appointment with the Minister of Mines and with the Select Standing Committee of the House at Ottawa on Wednesday, the 14th December.

The Committee of Council (Messrs. Lindsey, Caldwell and Lamb), met in Ottawa on the 14th of December, to urge before the Select Committee of the House on Mines, the necessity for urgent action; each member present addressed the committee.

The committee of the House reaffirmed unanimously its anxiety to have a mining law passed at once, and to have the disposition of mining lands transferred to the Department of Mines, but as that involved a transfer of power from the Department of the Interior, at the suggestion of the Minister of Mines, a sub-committee of the House was appointed to wait upon the Prime Minister, the Minister of the Interior and the Minister of Mines, and discuss these questions with them, and the Committee of Council were asked to accompany the sub-committee.

On the same day these deputations did wait upon the three Ministers mentioned, when the Prime Minister stated that if the Minister of Mines would prepare a Mining Act it would be introduced into Council, and if any objections should be presented to it, they would be threshed out there, and he was quite prepared that an appropriation should be made to meet the expenses of preparing such an Act.

The Minister of Mines next day arranged an appropriation and has placed in the hands of Mr. J. M. Clark, K.C., the preparing of the Statute, which is to be drawn up, on the basis, that the disposition of mining lands will be vested in the Department of Mines.

Personal and General

Col. A. M. Hay is in Haileybury.

Mr. Robert Bryce is in Porcupine.

Mr. Martin Nordigg sails for Europe on January 9.

Mr. R. E. Hore was in Toronto during Christmas week.

Capt. John Hampson, formerly manager of the Alice mine, near Creston, B.C., has gone to England.

Mr. F. M. Young, secretary of the Crow's Nest Pass Coal Company, has returned to Fernie, B.C., from a visit to the coast.

Mr. S. S. Fowler has returned to Nelson from a visit to mining properties on Princess Royal Island, in the Coast district of British Columbia.

Mr. J. W. Evans, Belleville, is recovering from the effects of an operation for appendicitis. He will not be able to move around for some time.

Mr. H. McI. Weir passed through Toronto on his way to Brantford, there to spend Christmas. Mr. Weir represents Toronto interests in Porcupine.

Mr. A. J. Becker, superintendent of the Lucky Jim zinc mine, Bear Lake, Slocan District, B.C., was in Winnipeg lately, in connection with the prospective provision of transportation facilities, to allow of a resumption of shipment of ore from the Lucky Jim.

SPECIAL CORRESPONDENCE

QUEBEC.

The report of Mr. J. B. Tyrrell on a large feldspar deposit on the north shore of the Gulf of St. Lawrence, 40 miles from the north shore of Anticosti Island, has come to hand. More exactly, the deposit is situate on a peninsula two miles long on Quatichoo-Manicuagan Bay, 37 miles east of Esquimeaux Point. The shore is generally low, although there are rounded hills of rock that rise to an elevation of 100 fect or more. The bay has not been charted, but Mr. Tyrrell believes that it is navigable for ocean-going vessels of ordinary draughts. Communication with the outside world is provided for by a telegraph line two miles from the point.

The greater portion of the coast appears to be underlain by dark, coarse-grained hornblende schist, striking towards the

northeast and dipping vertically. With the hornblende is associated a finer grained quartzitic rock. Parallel with the schistosity, great dykes of orthoclase pegmatite have been intruded into the schist. Whilst the walls are well defined in most places, in spots large masses of schist have been broken off and included in the pegmatite. The dykes vary in width from 100 to 200 feet, and extend from the extreme point of the peninsula northeastward for a mile or more on the property. Two of these dykes were examined.

The pegmatite of the dyke is composed chiefly of orthoclase (or microcline) feldspar and of quartz. Small quantities of

biotite, muscovite, and black tourmaline are associated. [Note —Orthoclase and microcline feldspars are of identical chemical composition. They both contain 16.9 per cent. potash theoretically. In nature, the potash may be replaced by varying amounts of soda.]

The feldspar is generally pink or light grey in colour. In places it occurs in large, very pure crystals, twelve inches or more in diameter; but, for the most part, even when the definite crystalline form is retained, the feldspar is mixed with small prisms and bands of quartz. In such cases the feldspar constitutes about 80 per cent. or more of the whole. This combination makes up the greater part of the dykes.

In some places the rock consists almost entirely of feldspar; in others it consists almost entirely of quartz, with a few large crystals of feldspar scattered irregularly through it. Most of the quartz is white, or light grey, in colour; but in some places it is of a beautiful pink colour, with an opalescent appearance. This would make a good ornamental stone. Generally, the more quartzose perlions of pegmatite are near the sides of the dykes, whilst the feldspar predominates near the middle.

The enormous pegmatite dykes are very coarsely crystalline. Large and very pure masses of feldspar crystals are often segregated together in quantities that may yield hundreds, or even thousands, of tons. From these segregations a pure high-grade potash feldspar could be obtained. But the great portion of the feldspar in the dykes is closely associated with a small amount of quartz, and forms with it a typical graphic granite, usually free from biotite or other deleterious material. Vast quantities

of feldspar in this form, corresponding to the "Standard" feldspar of commerce, could be mined above the level of tidewater, and, doubtless, much more could be obtained below this leve.

ONTARIO.

Cobalt.—It is predicted that 2,000 companies with Porcupine as their base of operations, will be formed this year. It is easy to sell any kind of property, no matter where it be, for a thousand dollars, as long as it is reasonably near good claims. They are being bought for acreage in companies forming.

There is a very general feeling among mining men that the Government should see to it that the wildcatting in the early days of Cobalt should not be repeated at Porcupine, as it will do harm to legitimate operators.

The bullion shipments so far this month of December have not been very high. But the total at the middle of the month had reached the 418,684 mark, so that it is certain that over half a million ounces will be accounted for.

The Jacobs interests have purchased the Bruce Brymer claim situated in the south of Tisdale and adjoining the Foster. Camps will be built and work commenced at once.

While there is no slackening of interest in Porcupine the real estate boom has for the moment eclipsed mining speculation. Since the announcement of the building of the railway the lots

have trebled in value and there is now much competition for lots on the townsites at Golden City, Porcupine City and South Porcupine. All three have claims on the purchaser. In the last month the building activity at the south end where Col. Carson is now interested, is intense.

Two new smelters are in the market for ore. One will be ready to treat ore by the end of next month as the building at Orillia is completed, and most of the machinery has arrived. It is known as the Canadian Refining & Smelting Co. and will treat 20 tons of high-grade a day for the present. The other has a small plant on Dufferin Street, Toronto, and is bidding especially for high-grade cobalt ores. They will give ten cents a pound for 7 per cent. cobalt, and 8 cents for 6 per cent. In silver ores they will only take the very high grade. They are also bidding for high-grade nickel.

The Porcupine Power Company is making every preparation to rush the work on the power plant at Sandy Falls on the Mattagami. They will have storehouses of their own at Kelso, their own teams on the road, and they are confident that they will have all the machinery at Kelso by the end of February and can deliver power.

A syndicate of New Liskeard, Hamilton, Toronto and Cobalt men has purchased the O'Kelly claim at Miller Lake for $40,000. Mr. V. E. Taplin is the secretary-treasurer of the company. Work will be commenced as soon as possible.

The Temiskaming mining company, which resumed regular dividend payments on Nov. 10, has declared a 5 per cent. bonus for the new year, in addition to the regular 3 per cent. They will on Dec. 31 have paid 32 per cent., or altogether $784,156.25.

With the payment of the dividend on Jan. 12, the Nipissing will have practically redeemed its capitalization, having disbursed 99 per cent, or $5,940,000. The La Rose at the same time will have paid 29 per cent., or $2,079,185. While there was no increase in the La Rose dividend rate this quarter there is every hope for a rise at the next declaration.

The Floyd Mining Company has gone into liquidation. The company's main claims were in an unproductive portion of Coleman.

The Hon. Frank Cochrane, Minister of Lands, Forests and Mines, has returned to Toronto after his trip to Porcupine. He states that no expense will be spared to push the Porcupine Railway to completion with all despatch. If necessary, a thousand men will be employed in the work. He expressed himself as highly pleased with the Porcupine country. At Porcupine a contractor named Morrison cross-examined the Cabinet Minister rather severely and very plainly told him the views of a portion of the mining men in the North.

The eight Armstrong-Booth claims adjoining the Rea mines have been optioned to Mr. E. P. Earle, president of the Nipissing, for a sum between $150,000 and $200,000. Three of the Armstrong-Booth properties were under option to the Timmins, but they did not take them up.

With the declaration of their Jan. 16 dividend the Crown Reserve will have paid 150 per cent. on its capitalization in less than three years. For eight quarters it has now paid 15 per cent.

Last November La Rose produced 408,000 ounces. The operating profits amounted to $153,000 as compared with $138,000 in October.

The Princess and Lawson alone earned the La Rose dividend for the month.

To broaden investments in Northern Ontario, the Trethewey-Cobalt intends to increase the capitalization to two million dollars. There is some opposition to the suggestion among stockholders.

After a considerable period of development, during which there was no attempt to take out ore, the Beaver is now preparing to ship a high-grade car, which will leave before the end of the year. In the meantime on all three levels good ore bodies are being opened up. On the 200-foot level a crosscut has now opened up a five to six-inch vein of 4,000 to 5,000-ounce ore.

The Right of Way will pay the regular dividend of 2 per cent. on Jan. 1. It has now paid 73 per cent. of the original capitalization of $500,000. Since the capitalization has been raised to a million and a half, 8 per cent. has been disbursed.

East of the Fourth of July alone the Meyer vein at the 175-foot level now shows ore for 225 feet. For twenty feet there was a barren patch in the vein, but with this exception the lead has averaged from six to eight inches wide of 4,000 to 5,000-ounce ore. Two hundred feet from the shaft a winze will be sunk on high-grade ore to ascertain the depth of the conglomerate. The dip of the conglomerate is much more pronounced here, so that in all probability 300 feet of that formation will be obtained in the drift farther east.

The month of November was notable with the Nipissing, both in regard to production and also the discovery of new ore bodies. During the month $200,851 net was produced, and $398,410 was shipped, all net. Of this total $84,000 came up the Fourth of July Shaft. The discoveries included the new vein at the Kendall, the ore at 140 feet at the new shaft 122, and further ore bodies at the Meyer and 164.

Seven tons of high-grade ore left the camp early in December from the Waldman mine. This was taken out from the old shaft some time ago, but was not shipped immediately.

In a very interesting paper at the Cobalt Board of Trade banquet, Mr. T. R. Jones, of the Buffalo, stated that the gold area represented in Porcupine is supposed to include 180 townships, or 6,480 square miles, of which only 84 square miles had been in the least prospected. In the possible silver area there were 9,072 square miles, of which 222 square miles, or 2 1-2 per cent., had been prospected. Of the area so far prospected, 5 per cent. had proven more or less producing areas.

Col. Carson, president of the Crown Reserve, confirmed the report that his company is contemplating the erection of a big mill if no customs concentrator is to be commenced at once in the Kerr Lake district. He stated that when the high-grade had been exhausted at the Crown Reserve it would still be a great low-grade proposition. He understood on good authority that there was five years of milling ore right in sight in the Kerr Lake district already.

In a few weeks there will be the best possible accommodation at Porcupine for travellers. Big well-equipped hotels are building at Porcupine City and South Porcupine.

The telephone line from Matheson to Porcupine is now in good working order, and is doing considerable business. A large number of messages have already been sent over it.

Campbell and Deyell, the two Cobalt chemists, will establish a branch of their business at South Porcupine, where a building has already been commenced and the machinery sent up. Dogherty and Dixon, two more Cobalt mining men, will also establish an assaying business in the camp.

There is now a rush into Denton Township, or what is better known as Cripple Creek. It is 45 miles from Porcupine. The assays from that district, while not spectacular, are uniform and fairly high.

BRITISH COLUMBIA.

The Granby Consolidated M. S. and P. Company has declared a dividend of one per cent., total amount $148,500. This is the twelfth dividend the company has paid, and it brings the aggregate of profits distributed among the shareholders up to approximately $3,900,000.

The Hastings (British Columbia) Exploration Syndicate, Ltd., operating the Arlington gold mine at Erie, in Nelson mining division, lately declared a dividend of sixpence per share on its 60,375 issued shares. The company's head office is in London, England. Mr. Leslie Hill, M.E., of Nelson, is resident consulting engineer and manager. This is the third dividend this company has paid during Mr. Hill's management,

but the first and second were each at the rate of one shilling per share.

Cariboo.—Now that the placer gold mining season is over for the year it is realized that there will probably prove to be a decrease in the quantity of gold recovered in 1910, as compared with that in 1909. The chief cause of the expected decrease was that the washing season closed early and there was not sufficient water to admit of the sluice boxes being cleaned up on several of the larger mines, consequently much of the gold washed out of the gravel must remain in the sluice boxes until after next year's season shall have opened. Good progress has been made with construction work on the Quesnelle Hydraulic Gold Mining Company's 17-mile ditch and pipe-line from Swift River to the company's gold-bearing leases on and near Quesnel River about 20 miles below Quesnel Forks.

Atlin.—The season is believed to have been the best placer mining operators on Atlin creeks have experienced since 1907. This is reported to be largely due to the greater yardage of gravel the North Columbia Gold Mining Company washed during the 1910 season and the consequent increase in the quantity of gold recovered. In addition there was some lode gold obtained from quartz crushed in a small stamp mill on Taku Arm of Tagish Lake.

East Kootenay.—While the tonnage of lead ore from the St. Eugene mine is less now than for years production at the Sullivan mine, also operated by the Consolidated Mining and Smelting Company of Canada, has been large enough lately to make good that deficiency. An ore-testing plant, designed to treat ores on a commercial basis, has been put in at the St. Eugene mill. Shipment of ore from the Society Girl mine, near Moyie, was in progress about the middle of December, but the tonnage then available was not large—probably between 150 and 200 tons of hand-sorted ore. Coal mining has been active at four collieries, namely, those of the Crow's Nest Pass Coal Mining Company at Coal Creek and Michel, and of other companies at Hosmer and Corbin, respectively, also in the Crow's Nest Pass district.

West Kootenay.—It is proposed to develop the Highland mine, Ainsworth camp, at a deeper level than has yet been worked on the property, if satisfactory financial arrangements can be made by the Kootenay Silver Lead Mines, Ltd., which company holds the property under option of purchase. Work is being done on both the No. 1 and Gallagher mines, and both will send down some ore when the sleighing shall be good enough for heavy hauling. The 1910 season has not been a generally good one at mines on the south fork of Kaslo Creek, from which the output of ore was comparatively small. The machinery for the Joker stamp mill has not yet been hauled to the property, but lies where unloaded from the K. & S. Railway, near the junction of the south fork with the main stream. Efforts will be made to do the necessary heavy hauling as soon as there shall be sufficient snow on the ground to make a good road. The late lessees of the Whitewater mine have abandoned their lease of the property as a result of the destruction of the concentrating mill by fire last summer. With neither concentrating nor transportation facilities, both having been destroyed by fire, there was no inducement to re-open the upper mine. Development work is, however, still being done in the "deep" of the Whitewater vein, by the company known as the Deep Mine, Limited.

In the eastern part of Slocan district, the Rambler-Cariboo and Lucky Jim mines are preparing for producing ore on a larger scale than for years. Already some 4,000 sacks of ore—about 300 tons— from the Rambler-Cariboo have been hauled part of the way to Three Forks, as far on the way as there has been snow for good sleighing. The snow is unusually late in coming this year, there having been little fall as yet low down the mountains. It is intended to regularly maintain an output from the Rambler-Cariboo of about 200 tons of silver-load ore per month, there being plenty of ore available for stoping on several levels down to the 1050-ft. Driving the low-level adit at the Lucky Jim zinc mine is being done faster now that there is compressed air for machine drills. A new compressor has been put in to replace that destroyed in last summer's forest fire. Development work is being continued throughout the winter at the Washington mine, above McGuigan Basin, and at the Surprise and Noble Five, on the Cody side of the divide. Near Sandon, mining progress is much as during several recent months, with the Ruth-Hope and Richmond-Eureka both shipping ore in quantity and the Slocan Star doing similarly, though on a smaller scale for the present. Practically all the smaller mines have been closed for the winter, work not being practicable to advantage when the winter snows are deep, and sometimes dangerous by reason of the risk of snow slides. There have been reports published in effect that the Standard mine has been sold, but as yet these are premature, for no sale has been effected. There is such an unusually large showing of shipping ore in the mine, with good reason to look for its continuance, much development work warranting this expectation, that its purchase from the present owners by Spokane capitalists is regarded as probable.

About Nelson, there is also activity in several directions. The Consolidated Mining & Smelting Company has been constructing a four-mile aerial tramway from the Molly Gibson concentrator towards the landing on the west arm of Kootenay Lake preparatory to resuming shipment of silver-lead ore from this mine. The organization of a company named the Kootenay Gold Mines, Ltd., has been in hand and it is understood has been accomplished. The authorized capital of this company is $250,000, and the chief object the acquirement of the Granite-Poorman gold mines and 20-stamp mill, situated within a few miles of Nelson. The property is owned by the Duncan United Mines, Ltd., and is being worked under lease by Messrs. Gough, Guille and Swedborg, fo Nelson. Copper ore is being shipped from the Eureka mine to Trail. The assets of the Hall Mining & Smelting Company, including the Silver King mine and a large group of adjacent mineral claims, smelter at Nelson, aerial tramway connecting mine and smelter, water rights, electric power transmission line, etc., have been sold, together with several other groups of claims also situated on Toad Mountain. The sale is an absolute one, and 60 per cent. of the purchase money has been paid, the remainder being payable in two instalments, the final one falling due next summer. It is reported a strong company is being organized in England to acquire this big consolidated group and other property included, and that it is proposed to drain the Silver King mine by a deep-level tunnel; also to work the North Star group, which is one of those being acquired. The question of operating the smelting works will be considered later, but it is regarded as a possibility.

At Sheep Creek developments continue to be satisfactory. The Queen is mining ore from a big shoot found in the deeper part of the mine. The Nugget keeps its 4-stamp mill going, and, at the same time the work of further exploring the mine is being steadily proceeded with. The Kootenay Belle is reported to have quite lately cut one of the known veins at a depth of more than 200 ft. below where it had previously been opened. The crosscut adit entered the vein at 325 ft. from its portal. Where explored in No. 1 adit at 90 ft. from the surface this vein ranged in width from 30 in. to 5 ft. A larger vein occurs within 100 ft., and the lower adit is to be extended so as to cut that at greater depth, as well. Little information is obtainable concerning the Mother Lode, which Mr. John McMartin, formerly of Cobalt, has been prospecting all the year. It is known, though, that developments are regarded as quite satisfactory, and tests of ore are being made with a view of determining the style of mill best suited for treating the ore.

Coast.—It is stated that the Tyee Copper Company has taken over from the Northern Texada Mines, Ltd., the lease of the Cornell mine, on Texada Island. This mine is one of the Van

Anda group, which in past years produced a considerable quantity of gold-copper ore, much of it of high grade. The output of the Cornell, however, during 1909 and 1910, was of ore which though of fairly good grade, was not as high as in earlier years. During 1909 and part of 1910 there was produced from the Cornell 14,600 tons of ore running from 3.7 to 4.5 per cent. copper, and about 1.4 to 1.7 oz. silver and 0.3 to 0.4 oz. gold per ton. Princess Royal Island is again having attention. Some years ago a company having its headquarters in one of the Maritime Provinces, did some mining on this island, but no work had since been done there until lately. An adjacent island, Gribbell Island, also had mining done on it, but this part also has been neglected for years.

Much interest is being taken in the official bulletin on Portland Canal, by Mr. W. Fleet Robertson, provincial mineralogist, shortly to be issued. There is this satisfaction derivable from Mr. Robertson's reports—he is thoroughly conscientious and reliable, and may always be depended upon to unequivocally state the facts as he finds them.

GENERAL MINING NEWS.

NOVA SCOTIA.

Halifax.—Reports from Scheelite, the Moose River tungsten mining camp, indicate that progress is being made. Several new and rich veins have been cut. Mr. Victor Hills, of Denver, has recently concluded an examination of the property.

Springhill.—M. J. Butler, general manager of the Dominion Steel Company, accompanied by Mr. McDougall, assistant general manager of the Dominion Coal Company, and Hector McInnis, the newly elected vice-president of the Cumberland Coal & Railway Company, who are now inspecting the Springhill properties, went to Parrsboro to-day to view the terminal facilities of the company at that point. They returned to Springhill this afternoon.

The strikers anticipated that Mr. Butler would ask for a conference with the men, but so far he has given no indication of a desire to meet them. A cheque for $21,000 arrived in Springhill this week from the headquarters of the U.M.W., in Indianapolis, and as rather a peculiar coincidence a double indemnity order was issued on the same day this week as the polling took place for the election of executive officers.

For over a week past picketings have been going on in a most active and demonstrative fashion. Hundreds of men and many women will line the sides of the streets and jeer and hoot at the strike-breakers. Arrests are being made daily. Some of the parties have been tried before the Magistrate in Springhill, while others are taken to Amherst. The feeling in town is growing more bitter and more intense, and it is difficult to understand how the present conditions can continue longer without more serious trouble arising.

NEW BRUNSWICK.

Hillsboro.—Buried beneath three or four hundred tons of rock was the terrible fate that befell three workmen in the Albert Manufacturing Company's quarries at Hillsboro on Dec. 16th. Several others had miraculous escapes. The dead are: Fred Nelson, aged 40; Edward Collect, aged 45; Theophilus Allain, aged 21. Octave Duplessis was severely injured.

The men were working on the face and at the bottom of the 40-foot embankment. Two of the men were drilling into the face of the quarry with a view to blasting the top off when suddenly the rock gave way and fell, burying the three men.

ONTARIO.

Ottawa, Dec. 14.—A deputation representing the Canadian Mining Institute, and a sub-committee representative of the Commons Standing Committee on Mines, conferred this afternoon with Sir Wilfrid Laurier and Hon. Messrs. Oliver and Templeman with regard to the recommendation passed by the Mines Committee this morning, that steps be taken by the Federal Government to pass a general Mining Act, and to secure as far as possible, from the provinces, uniformity of legislation and regulations governing mining operations.

It was agreed that an Act should be drafted and presented by the Government to the House this session, codifying the existing Federal regulations with respect to mines, and whatever further action possible to carry out the wishes of the mining men with regard to the uniformity of legislation throughout Canada.

Ottawa, Dec. 13.—Mr. Hudson, Government expert on explosives, has been sent out to investigate the cause of the disaster in the coal mine at Bellevue, Alberta. It is expected that the Government measure to be brought down this session with reference to the manufacture and use of explosives may also contain provisions tending to improved methods of mining and reduction in the number of fatalities.

ALBERTA.

Edmonton, December 12.—Thirty lives are known to have been lost, as a result of the disastrous mine explosion which occurred Friday night at 7 o'clock in the Bellevue coal mine, three miles east of Frank, Alberta.

There were forty-six men on the shift, and thirty-three of them were killed. Fifteen were rescued, some of them having narrow escapes. A rescue party was imprisoned, and two or more of the members of it have lost their lives it is feared.

The known dead include Fred Alderson, fire boss at Hosmer Mines, one of the rescue party, who first entered the mine, and the only man not an employee of the West Canada Coal Company.

News of the disaster did not reach Fernie until late Friday night and a caboose and engine bearing a party of rescuers from the Coal Creek mines, including Mr. Evans, Superintendent Shanks, and others, started for the scene of the disaster, picking up a life-saving apparatus at Hosmer.

A. Michael, General Manager Ashworth, of the Crow's Nest Pass Coal Company, and others, boarded the special which, after transferring at Coleman and changing crews at Frank, arrived at Bellevue at 3 o'clock Saturday morning.

A rescue party was at once formed, and the men, under the direction of J. W. Powell, superintendent of the mines, equipped with Draeger helmets and oxygen apparatus, entered the mine. The oxygen apparatus, though not thoroughly understood by the users, proved of much value, but owing to the fact the charges lasted only thirty minutes, and also through the lack of men to form sufficient relays, the apparatus was not as effective as expected.

The rescuers worked until 5 o'clock Saturday morning, when a cave-in occurred, imprisoning the entire party. Two of the men were experts in the use of the oxygen helmets, but one man, Mr. Fred. Alderson, was brought out dead.

Mr. McKenzie, of Blackmore, a member of the rescue party, was brought out barely alive, and is in a very serious condition. Many others are still in a precarious condition.

The thirty-three bodies recovered, in addition to those of the Hosmer miners, were all bodies of the original forty-five of forty-six imprisoned in the mine. Many have been identified, but in the case of foreigners especially, identification is difficult. Many bodies are badly mutilated.

Coroner E. M. Pinkney, of Lille, arrived soon after noon Saturday, and had a jury empanelled at once. An adjournment to the 19th instant was taken.

Relief trains, equipped with blankets, food, etc., and bringing physicians have arrived from all directions on the Crow's Nest line between Cranbrook and Lethbridge, and there is no lack of willing, sympathetic aid.

Every coal mine in the district is closed down and the miners are working in shifts in the work of rescue.

Many stories of the wonderful heroism will be told when the work of rescue is complete, but while there remains a single chance to save a life, the men refuse to talk of their experiences in the mine.

One incident, however, stands out clearly. Jack Hutton, miner at Frank mine, was one of the volunteers for the first relief party. After entering the portal he heard that his brother, Ike, was among the imprisoned. He worked until three in the morning, and finally located his brother in one of the side galleries. Ike, with others, had started for the surface, when they were caught in the second fall, and retreated to the gallery where the air was comparatively pure. When the second relief party arrived, and removed the debris, Jack Hutton staggered out carrying the insensible form of his brother. Both were overcome.

There are several stories at present as to the cause of the explosion. The one most generally accepted is that a fire supposed to have been put out in October, broke out again and ignited the gases. No shots were fired after the shift had left the mine.

Alderson, the mine boss from Hosmer, who lost his life trying to save others, leaves a wife and four children in England.

Six English miners were on the imprisoned shift and of these three have been identified as Joseph Maguff, Homan Tippo, pit boss, and Isaac Hutton, fire boss.

Edmonton, December 13.—Premier Sifton announced in the Legislature that the fullest possible investigation was being made into conditions of the mines in the south of the province, and particularly the one at Bellevue, owing to the recent disaster there. A provincial mine inspector has been sent there, and a local inspector has been on the scene since Saturday. Following the investigation, he stated that a commission would probably be appointed.

BRITISH COLUMBIA.

Fernie, December 13.—Six of the Slav victims of the Bellevue disaster were buried here in one grave, and the body of Fred Alderson will be interred at Hosmer to-morrow.

It is a significant fact in connection with the disaster that a Government mine inspector viewed the mine for escaping gas three days before the fatality, and posted a notice to the effect that the timbering and ventilation were good, and that there was no gas.

The Miners' Union had asked that an inspection of the mine be made and told Inspector Sterling, it is stated, that there were volumes of gas in the mine. It is thought that there is yet one unrecovered body.

Nelson, December 15.—The bonding of the C.P.R. group of claims at Ymir to a Vancouver syndicate, represented by Charles Jennings, with whom negotiations have been proceeding for some weeks, has been consummated.

The C.P.R. group, owned by Edward Peters, of Ymir, and George Colwell and G. G. Peters, of Nelson, and a number of associates, is located in close proximity to the Sterling group, which was recently bonded to Phil White, of Vancouver, and to the Blackcock, upon which a deal with Mr. White is now pending.

All papers in connection with the bond have been executed, and are now in escrow in the Royal Bank of Canada. The final payments are to be made within two years, and one of the conditions of the deal is that the development work at present being carried on shall continue throughout the winter. There are ten claims in the group, and a large number of surface cuts, a shaft, and several tunnels have been already driven on the property.

Vancouver.—It is announced that the Tyee Smelting Company, of Ladysmith, has bought the interests of the Cornell mine at Van Anda, Texada Island, originally worked by a British syndicate.

The latter syndicate abandoned operations and sold out to the Northern Texada Mines, Limited, who struck a rich formation of Cornite copper, yielding high values in silver and gold. They expended $300,000, and within two years this was all recovered from the mine and a handsome dividend was paid the shareholders, so that the sale price of the lease left them very much to the good.

The Tyee Company intends to put in a large amount of additional machinery, and development work will be started on a big scale. Others interested in the selling company in addition to Dr. Tanzer, are Messrs. S. G. Faulkner, A. A. Jones, Dr. W. R. Spencer and J. Y. Griffin, of this city; J. B. Suess, of Seattle; R. J. A. McGuiness, of Van Anda, and others. On his retirement as president and manager, Dr. Tanzer was the recipient of a presentation from the men.

The mine property itself is owned by Mr. H. W. Treat, of Seattle, and is situate one mile from Van Anda. Since January 1, 1909, 20,000 tons of high-grade ore are claimed to have been taken from the mine to the Tyee smelter at Ladysmith. Since that date $225,000 is also said to have been paid in wages and supplies, ninety-four per cent. of which remained in this province, and a further sum of $40,000 went to Mr. Treat in royalties. The machinery which the company installed upon taking possession cost another $25,000.

MINING NEWS OF THE WORLD.

..Bolton, Eng., December 21.—Three hundred and thirty-seven coal miners were entombed to-day in the Hutton colliery by a terrific explosion.

Eight hours after the disaster occurred only fifteen of those entombed had escaped. A pit boy who was the first rescued, declared that the disaster would cost the life of every man working in the shaft. The mine caught fire from the explosion and great gusts of black smoke rolled from the mouth of the shaft, driving back the rescue parties.

The shock of the explosion was felt for miles around and the families of the imprisoned men crowded about the shaft screaming and trying to enter.

As the body of one dead man was brought out there was a rush to try to identify the blackened remains.

Gusts of the deadly fire damp which filled the pit drove back the rescuing parties. The clothing of the rescuers was burned off and some of them emerged minus hair and eyebrows.

Great throngs crowded about the shaft begging to be allowed to take part in the rescue work. They were mostly relatives of entombed men and the officers who were strung about the pit were compelled to fight them back.

Eight hours after the disaster the rescuers took seven of the miners to the surface of the shaft. Although life was still in them they were badly hurt and the physicians who made a hasty examination before they were taken to the hospitals declared that they were probably fatally wounded.

A shift had just finished work in the shaft, but the men rushed from their homes, grimy from their night's work, clamoring to enter the shaft and rescue their comrades.

Special relief trains were rushed from surrounding towns bearing doctors, nurses and medical supplies. Experienced miners, long used to the disasters of the coal mining district,

were hurried to the scene. Especially constructed devices to guard against the fatal gases in the mine were brought there.

A temporary hospital and morgue were established. As the blackened and wounded men were brought to the surface they were taken with all possible despatch to the hospital. The dead were hastily embalmed and placed in the morgue for identification.

There were 337 men in the colliery at the time the explosion occurred and eight hours later only fifteen survivors had been taken out. At that time ten of the dead had also been removed.

Fire broke out in the mine following the explosion and prevented rescue work. Vast volumes of smoke mingled with the fatal fire damp. Great billows of fire spurted from the pit thousands of feet in the air and pockets of gas exploded from time to time with tremendous detonations.

Within a few minutes after the first blast occurred, the mouth of the mine was surrounded with relatives and friends of the miners. When these learned that the mine officials were considering sealing the mouth of the pit rioting broke out. The mine officials were attacked by the infuriated mobs and a detachment of soldiers was summoned to protect the representatives of the owners and prevent the men in the crowds from rushing to their doom in the shaft in the hope of attempting a rescue of their imprisoned comrades.

The local authorities were powerless to restore order. The municipal authorities deputized armed guards to patrol the mine company's property.

Members of the early rescue party, which was able to penetrate a short distance into the shaft before the fire passed beyond control, declared that more than 250 miners were undoubtedly dead, as they were working in a section of the mine completely cut off by falls of slate and a seething furnace of rescuers declared that the poisonous fumes and lack of fresh flames. Even if they escaped death in the raging holocaust, the air would kill them.

The mine owners declared that the explosion had been caused by an ignition of accumulated fire damp from an open lamp worn on a miner's cap.

The plight of the miners was rendered more desperate by a mishap to the machinery of the shafts where the cages refused to move for a time, preventing a quick escape and interfering with the ventilation. The rising gases were checked by obstructions and driven back upon the entombed men.

SOUTH AFRICA.

Johannesburg.—The Johannesburg Star reports the discovery of a gold formation—said to be similar to the Glynn's Lydenburg deposit—traced for a distance of 4,000 yards and situated 11 miles southwest of Pretoria.

Three of the finance houses are interested and prospecting is proceeding.

A prominent group of engineers who inspected during the week-end the Cyferfontein discovery on the Klerksdorp goldfield, express themselves impressed by the showing.

INDIA.

The gold production of the mines of the Kolar Goldfield (Mysore) and two outside mines (the Hutti Nizam's and the North Anantapur) for November was 47,272 ozs., an increase of 43 ozs. compared with the return of the previous month.

UNITED STATES.

Bakersfield, Cal.—At the recent meeting of the directors of the Independent Producers' Agency, in this city, several plans for the improvement of the oil markets were considered and it is probable that in the near future action will be taken to carry out the plans that met with general favour. One of the projects is for the Agency to rent all the storage it may need for a period of 10 years on a certain fixed amount, and not for month to month as prevails at this time. It is likely that steps will soon be taken towards this end.

San Francisco, Cal., December 20.—More than $78,000, $18,232 in gold bullion, and $60,000 in express bullion, has been stolen by Alaska treasure thieves, and the Canadian Government and the United States Post Office Department are working to-day to solve the crime, which was committed under mysterious circumstances.

The robbery of the $78,000 worth of bullion took place while the treasure was enroute from Fairbanks, Alaska, to this city. The authorities have been working upon the supposition that $60,000 was stolen from a United States mail bag on board the steamer Humboldt between Skagway and this city. Inspector Durand to-day declared, however, that he had discovered evidence that the treasure was stolen between Dawson and White Horse Rapids in Canadian territory.

Four persons giving the names of E. L. Smith, Margaret Henry and T .J. and G. M. Woodson, are under arrest in San Francisco. The quartette had $12,500 worth of gold bullion and currency in their possession when arrested. The authorities have not revealed the part they claim the woman played in the robbery.

Redding, Cal.—The Farmers' Protective Association has unanimously adopted a resolution demanding that the Balaklala Copper Company cease from operating its smelter at Coram, except in strict conformity to the decree of Judge Morrow, of the United States Circuit Court at San Francisco. The farmers charge that the fumes are still causing great damage to crops and that the smelter must close until such time as the Cottrell or other devices effectively control the objectionable smoke.

Colorado Springs, Colo., December 17.—Dividends aggregating more than $550,000 have already been declared or will be declared this month by mining companies operating at Cripple Creek, with headquarters in this city. Among the companies that have already announced these so-called "Christmas" dividends are: El Paso, $24,000; Golden Cycle, $30,000; Elkton, $37,500; Gold King, $19,737; Vindicator, $45,000; Acacia, $7,194; Granite, $16,500; Portland, $60,000.

Leadville, Colo.—When the year 1910 shall have been completed and figures are made up on zinc production in Lake County for the year, it is expected that the figures representing the output of carbonate of zinc will represent a surprisingly large percentage of the total. Close to 4,000 tons a month of carbonate of zinc are being produced, and the returns thus far indicate an average value of about $20 a ton net to the shipper.

MEXICO.

Durango, Mex.—Forty-seven miles northeast of Telehuanes, the Inde Gold Mining Company at the camp of Inde, is treating an average of 3,000 tons of ore a month, employing an all slime cyanide process and grinding with high-speed rolls and tube mills. The reduction equipment will be enlarged by the addition of a half-dozen Pachuca tanks to care for the ore from the company's recently acquired Potrillo mine.

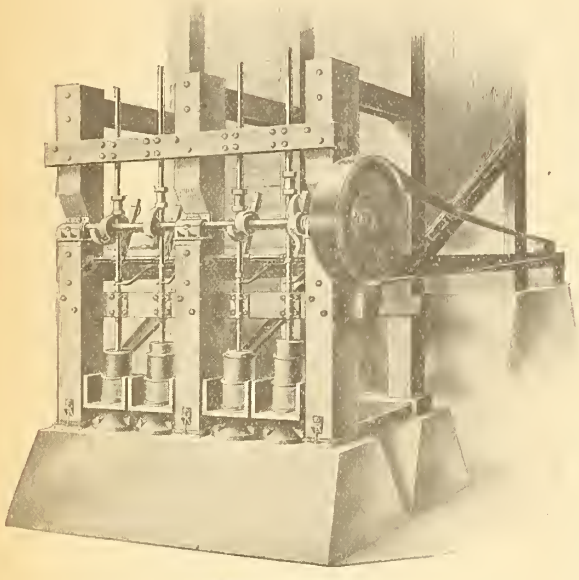
The Nissen Stamp Mill



Nissen Stamp Mill

STAMP. The Nissen Stamp drops with great crushing effect upon a feed comparatively free of the fines caused by preceding impacts. This causes a actual splash which radiates from the centre of the die, carrying the pulp to a circular screen, every aperture in which presents a full opening for the pulp which has already reached size to pass through; As the stamp ascends preparatory for the succeeding blow, a partial vacuum is formed under stamp shoe, which greatly assists the rapid return of the oversize to the die. This condition, the circular form of mortar, and the ascending stamp; lead to a suction effect which hastens the return of oversize to the die, a feature distinctive to the Nissen Stamp. Thus, a greater number of effective drops per minute is possible, resulting in greater capacity.

FEEDER. Each Nissen Stamp is provided with a tappet driven, automatic ore feeder of the Challenge type. This feeder is easily adjusted for different rates of feed, and is very sensitive in responding to the action of the stamp.

MORTAR. The Nissen Mortar is circular in plan and made to accommodate but one stamp, thus confining the crushing zone to a field of activity which forbids pulp coming to rest or becoming sluggish in that circulatory movement essential to efficiency.

Boston Consolidated type "B" Nissen Mortar

The screen of the Nissen Mortar is circular and extends more than half way around the mortar, forming an area of discharge for one Nissen Stamp equal to about two-thirds that employed for five stamps of the old type.

Mine Management

Our organization offers many advantages to investors and mine owners seeking competent management. Under our scheme of management a continuity of policy is assured regardless of changes in the local staff. We are willing that our compensation depend upon results obtained. We know that our methods mean low working costs and maximum profits. Let us make you a proposition.

GOLD

Its Geological occurrence and Geographical distribution by J. Malcolm MacLaren, D. Sc., 700 pages, one colored plate and 278 illustrations. Price $7.00, including postage.

Stamp-milling of gold ores

by T. A. Rickard, price $2.50. A careful description of the gold-milling processes on both sides of the equator. This book is well illustrated.

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

Apply Canadian Mining Journal

DEPARTMENT OF MINES. GEOLOGICAL SURVEY.

PUBLICATIONS

The Geological Survey has published maps and reports dealing with a large part of Canada, with many local areas and special subjects.

A single copy of a map or report that is specially desired will be sent to Canadian applicants free of cost and to others at a nominal price.

Most of the older reports are out of print, but they may usually be found in public libraries, libraries of the Canadian Mining Institute, etc.

A catalogue of publications will be sent free to any applicant. Reports that are out of print are indicated in the catalogue by a dagger.

Applications for publications should be addressed to the Director, Geological Survey, Ottawa, and should state definitely the precise area concerning which information is desired. It is often of assistance in satisfactorily filling an order for a map or report, if the applicant states the use for which it is intended. Letters and samples that are of a Departmental nature, addressed to the Director may be mailed O.H.M.S. free of postage.

REPORTS RECENTLY ISSUED:

CANADA

1085. Descriptive Sketch of the Geology and Economic Minerals of Canada. Accompanied by a geological and mineral map of Canada, by G. A. Young and R. W. Brock.

1099. Map of the Pelly, Ross and Gravel Rivers, Yukon and North West Territories. Scale 8 miles to 1 inch.

1089. Map 9A. Explored Routes on Parts of the Albany, Severn and Winisk Rivers. Scale 8 miles to 1 inch.

1103. Map 10A. Tantalus Coal Area, Yukon Territory. Scale 2 miles to 1 inch.

1104. Map 11A. Braeburn-Kynocks Coal Area, Yukon Territory. Scale 2 miles to 1 inch.

NOTE.—Maps published within the last two years may be had, printed on linen for field use. A charge of 10 cents is made for maps on linen.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.

The Michaelsen Ore Crusher and Pulverizer

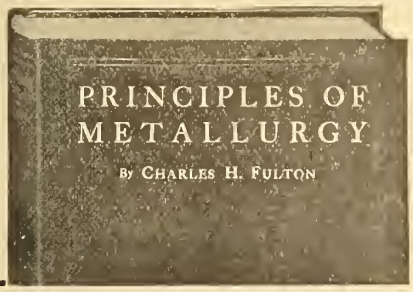
CHARLES O. MICHAELSEN, owner of Pat. No. 113991 is now prepared to furnish to the mining trade a new device in the line of an **Ore Crusher and Pulverizer.** This Crusher and Pulverizer is unexcelled in capacity, economy of power, economy of labor and repairs, and most essential of all, it accomplishes even pulverization.

MANUFACTURED BY

Northern Foundry & Machine Co., Ltd.

SAULT STE. MARIE, ONTARIO, CANADA

For further particulars address CHAS. O. MICHAELSEN, care of Northern Foundry and Machine Co.



THE standard treatise in English on general metallurgy. It is of the highest value and greatest practical use to every metallurgist. The sections on Alloys, Measurements of High Temperatures, Slags and Mattes are very important.

The author is President and Professor of Metallurgy, at the South Dakota School of Mines.

The Main Chapter Headings Are:

I.—The Metals and Metallurgy from the Historic Point of View. II.—Physical Mixtures and Thermal Analysis. III.—Physical Properties of Metals. IV.—Alloys. V.—The Physical Properties of Alloys. VI.—The Measurement of High Temperature. VII.—Typical Metallurgical Operations. VIII.—Slags. IX.—Matte, Bullion and Speiss. X.—Refractory Material for Furnaces. XI.—Fuels. XII.—Combustion. XIII.—The Production and Heating of Blast Furnaces. XIV.—An Example Illustrating the Physics and Chemistry of a Melting Operation. The Blast Furnace for Copper.

536 pages, 6x9, 188 illustrations, $5.00 (21s) net, postpaid.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals, extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The silver mines of the Cobalt district have astonished the world by their richness, and promising gold discoveries have recently been made in Porcupine Lake.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are: Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows:

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unsurveyed territory, is open to prospecting.

Miners' Certificates good for a calendar year may be obtained by sending $10 00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minimum being 40 acres in unsurveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of $10.00 plus a yearly rental of $1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed territory may be purchased as a mining concession at the price of $20.00 per acre if within 20 miles of a railway in a straight line, or $10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

The Hon. Minister of Colonization, Mines and Fisheries.
Quebec.

CANADIAN MINING JOURNAL
CONFEDERATION LIFE BUILDING, TORONTO

MINING AND SCIENTIFIC PRESS

Controlled by T. A. RICKARD — Established 1860 — Published weekly at San Francisco, Cal.

In every issue valuable articles are published on mining, metallurgy, and geology, the latest news from special correspondents at the principal mining centers, letters giving the ideas and experience of successful men, and other items of useful knowledge.

THE MINING MAGAZINE
Established September, 1909
T. A. RICKARD, Editor — Published monthly at London, England

A monthly magazine is the natural corollary of a technical weekly. It permits of more deliberate and more extended notice of matters concerning which the news element is less important.

The Mining Magazine includes a review of the world's progress in mining, metallurgy and economic geology, written by men who have personal knowledge of the regions and conditions discussed.

COMBINATION RATE: To new subscribers to both papers in yearly rate

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silv; $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Miner or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

"WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. **It does not freeze,** or rather, explodes with perfect efficiency when frozen **and needs no thawing.**

"AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appear ance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

PERMITTED EXPLOSIVES for Coal Mines
Nobel Monobel, Saxonite and Carbonite.

ON TIME

One of the most important business transactions which sensible minded men should perform on time is that of making proper provision for those who are dependent on them for the necessities of life.

The only way to do this is by means of life insurance. The only way to do it on time is to act now while in health. The most satisfactory way is to insure at once in the

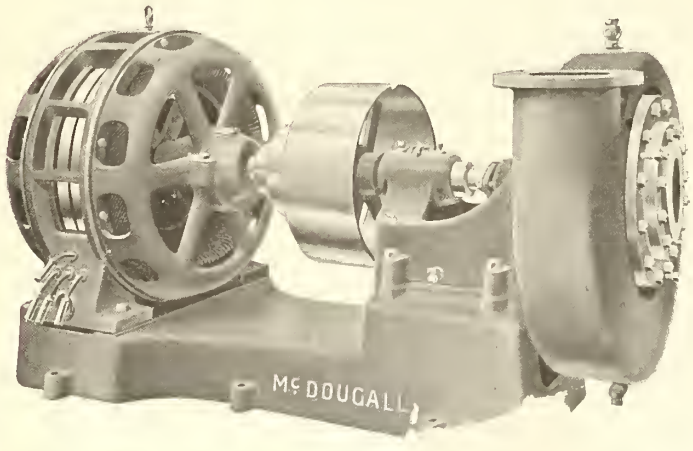
CENTRIFUGAL PUMPS



The Volute Pump here shown is specially designed to carry a heavy percentage of sand. It has a capacity of 2,334 Imperial Gallons per minute and is arranged for either belt or motor drive. We build these pumps of all capacities and of the highest efficiency. Our new Bulletin 106 gives many illustrations of their use

DOBLE WATER WHEELS

The Doble Water Wheel here shown exerts 100 H. P. under a head of 110 feet and operates Two Turbine Pumps having a total capacity of 320 Imperial Gallons per minute. We build these wheels of all capacities for heads up to 2,200 feet.

Hotel Shuniah,
Porcupine

THE only High-class Hotel in the Gold Fields, and being enlarged to accommodate the numerous patrons now coming in. The "Shuniah" will then be in a position to give first-class modern service.

An Enquiry Bureau in connection with the Hotel has been opened, and also a competent Stenographer engaged for the benefit of our many Guests and Visitors.

Genuine Satisfaction

If you have anything to do with Rock Drills, you have, probably, been disgusted with them many times and wished you were running by hand. You are striving for fewer delays, lower mining costs, increased tonnage, and increased profits, and cannot afford to leave anything untried which would aid in the attainment of the above.

Can you afford therefore to pass by

THE

"Cleveland" Stope Drill

and not give it a trial when we can guarantee that it will relieve you of this part of your troubles.

There are so many reasons "why" that we haven't space enough here to enumerate them, but will you please

Write for Bulletin 40A.

New Sullivan Air Compressors

Steam, "WA 4" Belt "WG 4"

Mining Companies will find these two new small Sullivan Compressors desirable on account of their ability to give continuous "year in, year out" service.

These machines are simple and plain in design, but in proportion to size, they are stronger and more durable than large "heavy-duty" compressors.

Efficiency-making details have not been omitted.

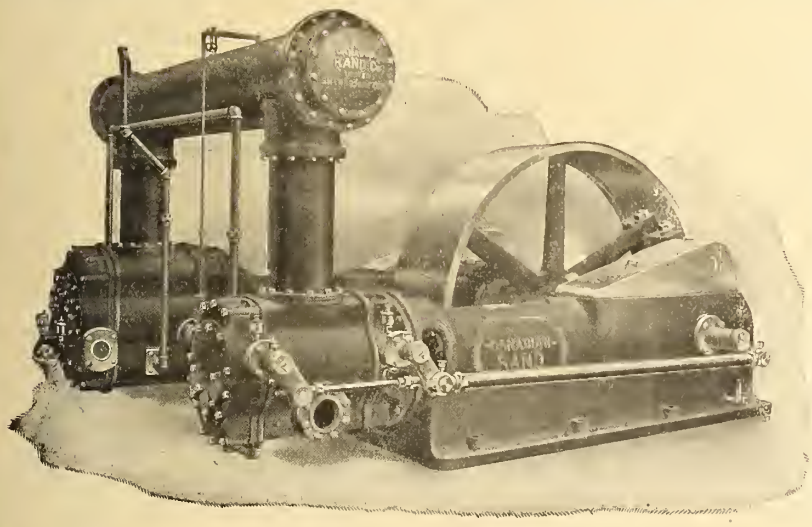
BEST FOR MINE BUILDINGS

Amatite has a genuine mineral surface.
This means th· t it requires no painting.
Contrast this with the fact that all ready roofings of smooth surface require painting regularly.
Figure out how much it costs you to paint the roofs of your mill, your shaft-house, repair shop and the other buildings?
Think of saving this amount not once—but three, four or five times—smooth-surfaced roofing requiring painting about every other year.
Amatite does not require any attention whatever after it is once laid.
Another point that recommends it to the Mine Manager is that it is easily laid and has galvanized nails and liquid cement in the center of each roll.
We can offer no more convincing argument in favor of Amatite than a sample of the roofing itself. The practical man recognizes its value immediately—its thickness, strength and durability.
We also have a booklet of facts. **Send your request for this free sample to the nearest office.**

THE PATERSON MANUFACTURING CO., LTD.

MONTREAL TORONTO WINNIPEG
VANCOUVER ST. JOHN, N.B. HALIFAX, N.S.

CLASS "RP-2" AIR COMPRESSORS



The Rand Class "RP-2." Duplex Power Driven Air Compressor combines the good principles of modern engine design with the best pneumatic practice.

The unusual capacity of Class "RP-2" Compressors is of course evolved through their high speed and high efficiency, but their massive enclosed dust-proof construction permits of high-speed without impairing the "Rand" reliability.

The superior quality of workmanship, rigid enclosed construction, exceptionally large bearing areas and efficient lubricating system which literally "floods" all important bearings, combine to give the high mechanical efficiency which characterizes this type.

Large free air ports, correctly controlled by improved Corliss Inlet Valves and "Imperial Cushioned High Speed Outlet Valves" insure highest compression efficiency.

Why the C.P.R. North Toronto Route to Ottawa and Montreal is the Logical One

The train leaves as follows:

Leave North Parkdale - - -	9.15 p.m.	Leave West Toronto - - - -	9.30 p.m.
Arrive North Toronto - - -	9.40 p.m.	Leave North Toronto - - -	10.00 p.m.
Arrive Ottawa, 6.50 a.m.		Arrive Montreal, 7.00 a.m.	

Daily except Sunday.

¶ The residents of Toronto are adjacent to either North Parkdale, West Toronto or North Toronto stations, same being easily accessible and closer to residential districts.

¶ The North Toronto route is over an hour faster and overcomes a long hill climb for the train obviating any inconvenience and ensuring early arrival at Montreal and Ottawa.

¶ The roadbed has been improved till it is unexcelled in Canada. Practically half the line is double tracked.

¶ The equipment is "Canadian Pacific Standard," a synonym for the "best" and attentive porters, non-obsequious, ensure efficient service.

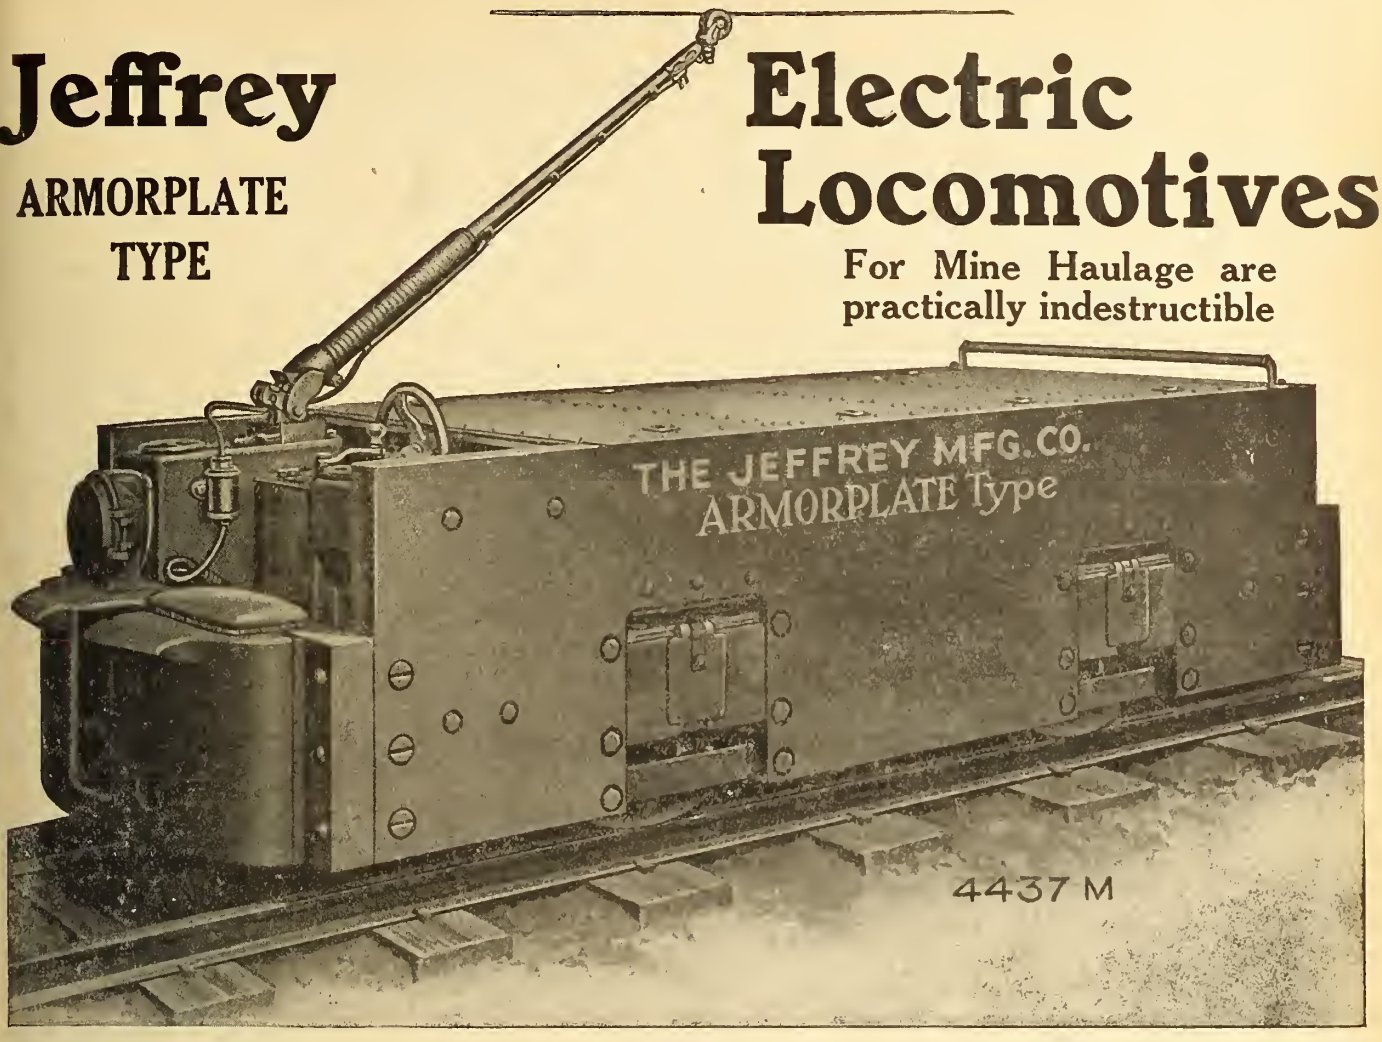
Electric Locomotives

For Mine Haulage are practically indestructible



THEY are designed and built to withstand the most severe service encountered in underground or surface haulage.

Frequent accidents impose severe conditions upon Mine Locomotives. You may have had the experience of "head on collisions," or Locomotives jumping the track and striking the rib. The results are invariably disastrous.

The sides and ends of these Locomotives are built of special solid steel plates securely bolted together, forming tremendous rigidity in the frames, as well as providing absolute security for the mechanical equipment.

TAXING MINERAL RIGHTS.

The Toronto Globe vigorously insists that the present Government of Ontario should impose a tax upon mining rights as distinguished from surface rights, alleging, and with reason, that it is inimical to the public good that speculators should be privileged to hold such mining rights without attempting to utilize them, and without paying a cent in taxation. The Globe is right. But the Globe goes too far in blaming the present administration for this state of things. Present conditions were inherited from the late Government which was in power for over thirty years, and which did nothing to remedy the evil complained of. On the other hand, the Whitney Government has made a beginning in endeavouring to eliminate an insidious, because hidden, evil that is seriously injuring the progress of the mining industry of Ontario. By substituting for the old Algoma tax of one cent an acre, a levy of two cents per acre on all mining lands or mining rights in the unorganized territory a certain stimulant, though perhaps not a very energetic one, has been supplied to the exploitation of such properties. That a tax of even two cents an acre is sufficient to cause many owners of undeveloped lands to lay down their burden is apparent from the long list of lands recently published in the Ontario Gazette as having been forfeited for taxes in arrears.

The Government, of course, must go a step further and extend the tax to mining lands and mining rights in organized municipalities. In the mining regions of Eastern Ontario there are many cases where the mineral rights have been severed from the surface rights when the owners have parted with the latter. Nothing is done by the proprietor of the mineral rights to ascertain whether valuable minerals are or are not there; the surface owner has no incentive to prospect for them; the mineral rights are not taxed; and in the course of years the owner dies or moves away. Thus, no matter how promising a deposit may be brought to light, no one can obtain the legal right to work it.

Again, in the Southwestern peninsula the oil and gas rights reserved or claimed by the Canada Company in farmers' lands have been a fruitful source of trouble and controversy. Not being assessable by the municipal or provincial authorities, they cost the company nothing to carry; but when strikes were made in the vicinity the company was at once benefitted by the enterprise of other people. Roads and other improvements are required when discoveries are made on mining rights, as well as when made on mining lands; and the owners of mining rights should be obliged to contribute to the cost as well as to pay the same taxes as

mining lands that include the surface as well. Then when default is made in payment of the latter, the mineral rights would revert to the Crown and a clear title could be obtained.

THE CHIBOUGAMOU REPORT.

The preliminary report of the commission appointed to investigate the Chibougamou (Quebec) region is distinctly disappointing, but cannot be considered finally discouraging.

For some years wild rumours of rich mineral deposits have been circulated, and much pressure was brought to bear upon the Quebec Government to construct 120 miles of railway from Lake St. John to tap the Chibougamou country. This the Government wisely refused to do. Too few facts were known. But the Government did consent to send an independent commission of specialists to examine the land of promise.

The personnel of that commission was carefully selected. With Dr. A. E. Barlow as chairman, and Prof. J. C. Gwillim and Mr. E. R. Faribault as his associates, the Government had every reason to place implicit confidence in the commission's singleness of purpose and in the correctness of its findings. The appointments were made with absolutely no reference to politics or to any other consideration than fitness. Ample appropriations were placed at the commission's disposal.

Throughout the summer's campaign nothing was heard of the work being done. Nor had any information been officially divulged until the tabling of the preliminary report on January 11. This is creditable to all parties concerned.

As regards the reported rich discoveries of gold, copper and asbestos, the commission found little corroborative evidence. No evidence at all was obtainable to confirm the reputed occurrence of ores of silver and cobalt. Iron ore and iron pyrites are spoken of more hopefully. But in general the commission's statement directly refutes the wonder-talk of the prospector. Fuller details in the final report may tend to qualify this disappointing pronouncement. Meanwhile, it is only possible for us to accept the fact that Chibougamou is not what we had hoped.

It must not be forgotten that the members of the Chibougamou commission would be the last persons in the world to damn the region altogether. Their duty was to determine the general geological character of the country, and to discover how true were current tales of spectacular wealth. Their finding must be accepted as it is offered—as an appraisal of the present results of prospecting in one section of Northern Quebec. It must not be misconstrued into a sweeping condemnation of a region that may yet prove entirely worth while.

RISE, SIR MINER!

Is the mining man without honor in this sorry scheme of things? We look for him in vain in our Houses of Parliament. He is not conspicuously visible in that Palace of Sleep, the Senate. Nor does the coveted flower of Knighthood decorate him. And still our wonder grows that this is so!

Not numerous are those of us who are eligible for the Senate. This perhaps, is as it should be, Dr. Osler notwithstanding. Some few of us should aspire to the House of Commons. We are needed there. A full score of us we can name who have claims upon the accolade —claims sounder, larger, and more dignified than those of many a living Knight. We are producers. Humanly speaking, we create wealth. Our work adds to the health, also, of the nation. We blaze the path for the farmer and for the railway. Towns spring into being at our bidding. Indeed and in sooth we are the people!

But, withal, we are not dreamers dreaming greatly. Nay, we are highly practical persons with large desires. Weary are we of being ignored by the Powers, and played with by the politician. The time has come when we yearn for several well-nourished statesmen of our own to whom we shall say "Go." and observe them going.

Nor would we resent a trifling lot of senatorial seats. But this way lies trouble. We can but call for volunteers. Not ours the job of nominating. And if, perchance, a desultory geologist or two accept the honour we shall speak no word of blame.

As for Knighthoods—well, that's another matter. Most of us have rolled that succulent, sibilant, prefix over our tongues conjoined with the names our parents gave us. For our immediate selves we shall not, cannot, speak. Kind friends will remember to do that for us. But it has often struck us that a discreet distribution of royal favours amongst, say, the Council of the Canadian Mining Institute would be soothing and grateful. In fact this thought fires our imagination.

Ottawa papers please copy.

FRENCH COAL DUST EXPERIMENTS.

An abstract of reports of the French coal dust experiments, conducted at Lievin Experimental Station during 1907-10, has just been published by the Colliery Guardian. Some general conclusions embodied in the pamphlet we shall outline herewith.

The practice of watering in front of shot-holes in dusty mine galleries, is commended. When the amount of water is equal to that of the dust, explosions can be checked, if not prevented, before extending seven to eight yards. A further good precaution is to water the gallery for about 10 yards previous to shot-firing.

General watering of the galleries, and, as an alternative, the dissemination of incombustible dust in sufficient quantity to form at least 40 per cent. of the mixed dust, are also urged. Other precautions, such as washing the tubs, lime washing the walls and floor, are suggested.

The difficulties and drawbacks of systematic watering are pointed out, and schistification (the dissemina-

tion of incombustible dust) is dwelt upon as being often advantageous. But stress is laid upon the fact that local watering and schistification are powerless to arrest an explosion that has been well started.

The question of arresting an explosion that has already become serious was, therefore, looked into. It was found that an explosion that had developed over a length of 75 metres could be stopped by establishing an arresting zone 100 metres in length. But a high degree of watering or schistification was required in that zone. Four times more water (by weight) than there is dust was found necessary to establish the zone; and at least 75 per cent. of slate dust when schistification was resorted to. Both methods have their drawbacks.

Far more efficacious were the experiments with two new methods—concentrated schistification and concentrated watering. Briefly, in these methods the flame arrives at the moment when the water or combustible dust has just been overturned. The arresting barriers are thus extinguishers rather than gradual suppressing agents. Whilst these results are tentative, they are extremely encouraging.

Other conclusions reached are that no explosion can be produced by the ordinary initial causes in a dust deposit where the content of volatile matter does not exceed 18 per cent.; though it may be propagated there as the result of a violent initial explosion occurring over a portion of dust deposit richer in volatile matter, or started by firedamp or by explosives. It is also stated that, other conditions being equal, coal dust rich in volatile matter is more dangerous than if the content of the latter were smaller.

The practicability of applying these experimental results to working mines has not been fully demonstrated. But that, we believe. is only a matter of time.

MR. W. H. ALDRIDGE.

The announcement of the retirement of Mr. W. H. Aldridge from the active management of the Consolidated Mining and Smelting Company of Canada came as a surprise to his large circle of friends. Since 1897, Mr. Aldridge has been the controlling spirit in the C. P.R. mining interests in British Columbia. In that year he arranged the purchase of the Trail smelter from F. Augustus Heinze. The history of the enterprise has been a record of expansion. Operated until 1906, under the name of the Canadian Smelting Works, the plant was then taken over by the present company, which had also acquired large mining areas near Rossland.

Mr. Aldridge still retains his place on the board of directors, and will continue to act in an advisory capacity for the Consolidated. His position as general manager is to be filled by Mr. R. H. Stewart, a thoroughly competent and experienced official, who has long been connected with the company. Mr. S. G. Blaylock becomes assistant general manager. Both of these gentlemen have excellent records.

IMMUTABLE MAN.

Human nature in all ages remains startlingly unchanged. Here is a quotation from an old volume, printed first in German and translated into English in 1730. The reference is to mining in the Hartz Forest:—

"This Mountain is hollow'd out underground into such large Caverns, that they in some places are too high to be propp'd; wherefore 'tis very dangerous to workfl in some of the Mines; upon which account the Miners at Goslar are two Mornings in the Week exhorted by a Sermon to live in the Fear of God, to be prepar'd in case of any Accident; but they are such a fool-hardy audacious Crew, that when the Parson preaches a little longer than ordinary, and the City-Gates are open, they run out of the Church, leaving him to preach to him-self."

Our sympathy goes out to that poor preacher. His life-insurance policy was not popular.

THE TUNGSTEN MARKET IN 1910.

Canada is not yet a producer of tungsten ores, although within a few months shipments will be made from the rich deposits at Moose River, Nova Scotia. The condition of the tungsten mining industry in the United States is, therefore, of interest.

Ten years ago the production of concentrated tungsten ores in the United States was only 46 tons, valued at $11,040. Last year's output was 1,824 tons,valued at $832,992. This is probably the largest annual output on record in any country.

Prices during 1910 were fairly high, ranging from $6.50 to $9 per unit, for concentrates carrying at least 60 per cent. tungsten trioxide. California and Colorado are the principal producing States.

The Nova Scotian ores are more easily concentratable than those mentioned above and it is probable that higher prices will be obtained for them.

THE SILVER MARKET DURING 1910.

A happy augury for one of Canada's greatest mining camps is the continued strength of the silver market. After maintaining an average price throughout 1909, of 51.502 cents, the metal more than held its own during 1910, the average price for the past year being 53.486 cents. For the latter half of 1910 the average was 54.318 cents, a decided improvement over the preceding six months. The highest monthly average in 1909 was that for May, 52.905 cents. The highest during 1910 was November's average, 55.635 cents. The corresponding low figures were 50.468 cents for March, 1909, and 51.454 for the same month in 1910.

Arguing from analogy, we may expect a drop in price through one or two winter months. But there are plain indications that the Chinese and Indian demands will be large during 1911, and that, therefore, there will be no significant falling off in prices. Much will depend upon the success of the Chinese Government's

effort to negotiate its loan of £10,000,000 on easy terms and to standardize its currency. Much also will depend upon climatic conditions in India during the autumn of 1911. At present there are few reasons to doubt that the forthcoming year will develop a larger market for silver in the Orient. As Cobalt's output may be increased considerably, this fact is stimulating. One has only to multiply the output of Cobalt by a digit to arrive at a very comfortable sum.

"GOLD MINING IN NOVA SCOTIA."

In The Mining Magazine for December, an article that appeared in the CANADIAN MINING JOURNAL on gold mining in Nova Scotia, is commented upon. The Mining Magazine agrees fully with the conclusions there indicated. It takes exception, however, to the use of the word "venturer" as an equivalent of "adventurer." Our choice of the former word was deliberate. Either is correct. But "adventurer" smacks of high or shady finance. "Venturer" is shorter, crisper, and more apposite. Objection also is made to the use of the word "profits." Our contemporary in this case is right. That word is loosely employed. Unless we were justified in sacrificing literary finish for the sake of emphasis, we should not have employed the phrase.

However, we submit that in discussing a topic so important it would have been better for our acute trans-Atlantic contemporary to have omitted these meticulous refinements. There is such a thing as painting the lily. Moreover, such prods induce an irritating desire to search the columns of our captious sister for like lapses.

EDITORIAL NOTES.

The provisional programme of papers to be read at the thirteenth annual general meeting of the Canadian Mining Institute is most attractive. In the list we notice two papers on mining law, one on the markets for Canadian ores, and one on photography. Many other topics are to be treated. The meetings are to be held at the Chateau Frontenac, Quebec, on March 1st, 2nd, and 3rd.

The ventilation of collieries will be the subject of a series of articles soon to appear in these columns. Along with the work of salvage, this is a topic of immediate moment.

A motor car to run on the winter route between Matheson and Porcupine is the last word in northern transportation.

The payroll of the Nova Scotia Steel and Coal Company totalled $2,825,000 in 1910, as against $2,480,226.91 during the previous year. The average number of employees was 5,276, as compared with 4,450 during 1909. In every department there was a large increase in outputs. Most marked was the enlargement of iron ore and coal production.

REVIEW OF MINING IN COBALT DURING 1910.

(Written for the CANADIAN MINING JOURNAL by its Special Correspondent.)

It was estimated three months ago by an engineer intimately acquainted with the camp, that if no new ore bodies were found there were reserves sufficient to maintain the present output from the Cobalt area for two years. That was at the rate of a million dollars a month, so that at a conservative estimate there were then $24,000,000 unmined, but in sight.

Since Mr. A. A. Cole made his careful estimate the most important discoveries of the year have been uncovered. These comprise not so much new ore bodies as the continuation of pay ore where it was scarcely hoped it would occur.

WHERE AND HOW HAS THE COBALT CAMP MADE PROGRESS IN THE YEAR OF GRACE 1910?

Silver Area Not Widened.

No new discoveries of importance have been made during 1910 outside the known silver-bearing area. In no instance has any of the pioneering prospects in the new territory made good. Some gallant attempts have been made to widen the field; but in every instance they have failed. The real accretions to the wealth of the camp have occurred in the development of hitherto but partly explored territory within the silver circle, and through the tapping of the new veins on the old producing properties. Instances of the first are the Savage and the Cobalt Provincial, of the second, the La Rose and the Temiskaming. It would seem that, while it is as yet too early to be able to state definitely that outside the arbitary lines there is no silver in payable quantity, yet the prospects of properties without the Pale are rapidly diminishing with the progress of time.

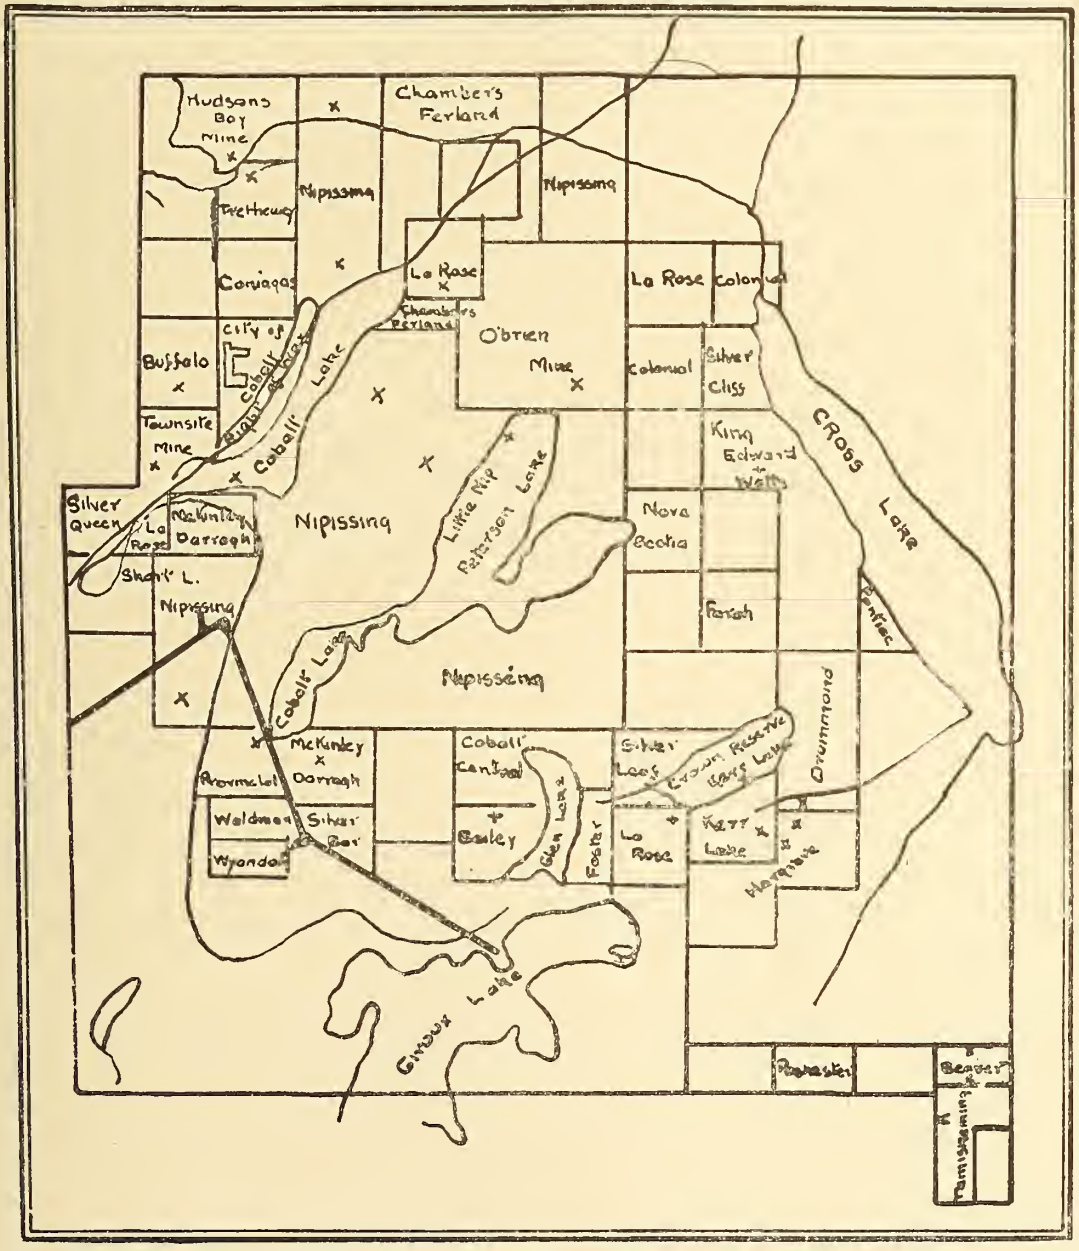
Upon the small map that accompanies this article will be found a number of crosses indicating where new ore bodies or unexpected extensions of producing veins have been found during the year just past. In the extreme northwest corner of the map will be seen the Hudson Bay mines. In the extreme southeastern are the Beaver and the Temiskaming. While the Ophir Cobalt has had small bunches of silver ore and the John Black a strong cobalt vein, neither of these companies has made any material advance this year. The South Coleman district is now the section of the Cobalt camp of speculative value, excepting the Beaver and the Temiskaming, which have shown marked improvements as mines during the year. Several properties have gone to the 400-foot level and are exploring at that depth; but beyond the ore bodies which the Beaver and the Temiskaming share nothing that promises to be of permanent value has been discovered. To the rich have been vouchsafed fat millions more in divi-

dends and ore reserves; from the poor has been taken away even that which they had, namely hope.

The Famous West Ridge.

In the extreme northwest corner of the producing area of small capitalization and huge dividends, the Hudson Bay has obtained a new lease of life and built a mill. Last year Hudson Bay had decided to increase its capital and venture into the open stock market. There was some difficulty experienced in completing the deal and, while Hudson Bay now operates the rich mine on the Buck line, it is but another name for the T. & H. B. It has remained satisfied to run a big producing mine on an $8,000 capitalization and pay its shareholders 300 per cent. per annum every two months or oftener. There was something like resignation in the attitude of the management with regard to the physical condition of the mine last year, but the main lesson of 1910 has repeated itself here. Where there is one strong high-grade vein there is a similarly strong probability that there will be several more. The Hudson Bay Company has found several bonanzas this year, not comparable with the big vein, but enough to insure 300 per cent. dividends for some time to come.

The satisfactory development of the hitherto unexplored area near the Hudson Bay mine line has amply justified the erection of the big mill on the property. With characteristic caution, little was spent on development in the northern section until the existence of several veins had been proven from the Hudson Bay's property. Now the No. 3 shaft promises to be the surface manifestation of a second mine. The mill has more than justified expectations. It is daily running its scheduled capacity of a hundred tons, and the heads are high in the mill ore.



Like almost every enterprise associated with the mining industry in Northern Ontario, the Trethewey intends to enter the Porcupine field, and with this aim in view the directors have approved of the doubling of the capitalization. The Trethewey still prefers not to go on a quarterly payment basis, but has paid and declared this year 20 per cent. in dividends.

With the debt of the Thorold smelter and the enlargement of the stamp mill wiped off the production of the Coniagas is now more likely to keep pace with its development. In the last two months of the calendar year 1910 a million ounces were produced. The last

quarter of the fiscal year of the Coniagas showed the very considerable advance that had been made in production, and the whole twelve months showed a few ounces short of the two million mark. As Mr. Leonard explained in the annual statement, the smelter and the mill are now able to handle a very much increased tonnage and, as the mine shows a gain of three and one-half million ounces in ore reserves, it can answer readily enough to the augmented drain on its resources.

The property cornering on the Coniagas to the southwest, and on the same famous ridge, produced in the first six months of the fiscal year ending November about 850,000 ounces, or very considerably more than for the same period of last year. The Buffalo has now joined the ranks of the Cobalt properties that have repaid the whole of their capitalization, and as fresh ground has been opened up at the 300-foot level and to the west, the ore reserves, when the annual report comes to be framed at the end of April, will certainly show no diminution.

South of Cobalt Lake.

Directly west of the Buffalo, a company controlled from England, the Cobalt Townsite has, under the skilful guidance of two of the best mining men in the camp, J. Reddington and C. E. Watson, been placed upon a shipping basis. So far this year attention has been confined to the shaft on the Buffalo line where some good ore bodies have been discovered underground and promising veins located on the surface. A contract for a considerable amount of ore has been let to the Northern Customs plant at Cobalt, indicating that even with the discovery of no new ore bodies it will be a regular shipper for at least some months of next year.

Under new management, and resigned to rank as a low-grade mine, the City of Cobalt has been steadily making small profits during the year. Its contract with the Northern Customs has been adhered to and all the ore has been trammed direct to the mill without hand-picking. Towards the close of the year a narrow, but rich streak of high-grade was cut at the bottom level, evidently a continuation of one of the recently discovered Townsite leads. Only a few acres of the City of Cobalt adjacent to the Buffalo and the Townsite have as yet been explored below the surface. At the annual meeting a considerable balance was shown and there was a disposition among some of the directors to declare a 3 per cent. dividend, but more conservative counsels prevailed and it was set aside for the further development of the property. The quarterly statement ended December 31st, shows that the mine had a balance of $28,000.

It is to the southern strip of property lying between the Townsite and the McKinley-Darragh that the Right-of-Way mine owes its further lease of life. For the better part of the year a steady shipment of three cars per month has been maintained, one of high and two of low grade. Increased acreage obtained when the capital was raised, has so far proved a profitless investment, but nothing further than the sinking of test pits and trenching on the old Cobalt Merger property has been carried out. The Right-of-Way has each quarter paid 2 per cent., which entails a slightly higher expenditure than six per cent under the original capitalization of $50,000.

If Cobalt Lake be represented as a clumsily drawn leg with the toe to the southeast, it may be said without fear of contradiction that the companies owning properties adjoining the toe have had a very prosperous and lucrative year.

Advance of McKinley

In the space of two and a half years Mr. Robbins has raised the McKinley-Darragh, with a dubious past and a hazy future, from the ranks of the intermittent shippers to the pedestal of a quarterly dividend payer and the producer of a million ounces every six months. Towards the end of 1910, the stock aroused interest in the market for the first time for the year, the 12 per cent. bonus being sufficient justification for a steep rise. At the very height of its productivity Mr. Robbins leaves the oldest mine in Cobalt for the Hollinger in Porcupine.

Sandwiched between the defunct Silver Queen and the McKinley-Darragh the Princess became early last year the rising hope of the La Rose Consolidated, long before the Lawson had shown any indication of living up to its wonderful surface showings. From a weak member of the La Rose tribe, barely paying her own way, the Princess has developed into one of the important feeders of the Montreal company; and now adds her regular quota to the total tonnage leaving Cobalt yards under the joint title of the La Rose Consolidated.

Leaving the west and southwest edge of the Cobalt field, Cobalt Lake bounds the great stretch of the Nipissing. The New Year hope that Sir Henry Pellatt's company was at last coming into its own has not been confirmed. Several excellent ore bodies were discovered near the McKinley-Darragh boundary. But the richness diminished in precise ratio as the drift progressed north. With the most rigid regard to economy it is stated that the financial statement at the annual meeting will show a surplus of $100,000. The physical condition of the mine is scarcely as good as it was a year ago.

The Nipissing occupies the centre of the stage, while the score or more of other properties camp on the edges of the productive area, with the Temiskaming and Beaver as an oasis of productivity in the southeast. To the east of Cart Lake and Peterson Lake the Nipissing has only prospected in the old haphazard, pre-Watsonian way. The season of surface exploration just passed, while rewarded with some discoveries of value, did not yield another 122. The main extension of the field lay in the southwest, where a most unenticing crack opened out into eight or nine inches of bonanza ore. It is in the Keewatin area previously regarded lightly. Underground work is being carried on this winter at this point.

Below, the surface finds have been most gratifying. The ore shoots of 64 have occurred with the exactness and precision of the decimal point. To the east the Meyer has developed into a 250-foot long ore body, definition and grade not to be surpassed in the camp. As it is reckoned that the conglomerate will carry down for another 70 feet, it would appear that the Meyer may be the legitimate successor of the Kendall as the premier producer of the Nipissing. On the east side of Cobalt Lake the cutting of the expected ore body fifty feet below the first level at shaft 122, is probably of more importance than the duplicating of veins at the Kendall. While recognized as a first rate prospect this new ore body was modestly credited with but a few hundred ounces in the last annual report. Length the vein had, but not depth before the discovery in November; but it now definitely enters the list of Nipissing producers. Two interesting departures will mark the career of the Nip in 1911. Despairing of finding all the valuable leads by trenching, Mr. Watson is now going to hydraulic all his acreage, commenc-

ing when the snow leaves Nipissing Hill this spring. The other departure is the treating of their own low grade ore in a mill to be erected on the property as soon as the exhaustive experiments have determined the best methods of extraction. One shaft alone at the present time is keeping a customs mill operating at full capacity so it is apparent that the Nipissing concentrator will mark a period in the treatment of low grade ore in large quantities.

Within the embrace of the Nipissing the string of leases on Peterson Lake belonging to the mining company of that name have not made any marked progress during the year.

The Little Nipissing has continued to find ore and to ship it. Despite some excellent and praiseworthy essays it alone on the lake figures in the shipping list.

On the northern edge of the Nipissing the Chambers-Ferland has fallen far short of expectations. Beyond the regular shipment of low-grade ore this neighbour of the main La Rose has shown a quiescence distinctly disquieting to its stockholders.

Justification of Lawson.

After a period of depression and anxiety the La Rose has now settled down to a production that will infallibly raise the dividend rates, when it is considered that sufficient cash reserves have been accumulated. Last quarter the Lawson and Princess earned the two per cent. dividend alone. The disappointment of the early part of the year was the leanness of the spectacular Lawson vein, a few feet below the surface. Nor today has the Silver Sidewalk proved aught but silver plated. No. 2, in the Keewatin, showed unexpected values, and No. 11, on the Foster boundary, also helped to retrieve the position. Both of these discoveries have been overshadowed by the opening up of a wonderful shoot of ore on No. 8 vein on the 200-foot level. As there was practically no high-grade on the upper level of this lead, the duplication of the surface indications was as gratifying as it was surprising. There is now a drift a hundred feet long on No. 8 vein and fifty feet of it is probably almost as rich, if not as spectacular, as the Silver Sidewalk which made the Lawson famous. In width and values it can only be compared with the Meyer vein of the Nipissing. At the main La Rose, cross-cuts from the main vein at four different points have tapped an ore body parallel and as rich as the great producer. Though the developments on No. 3 far surpassed expectations, this parallel vein is easily the best ore body in the mine now.

La Rose has now ceased to ship low grade; it has cut down tonnage and increased production. The Princess has already been referred to. When La Rose prospects were gloomy, drifts on this little slice of conglomerate at the south end of Cobalt Lake gave the first promise of improvement.

The O'Brien completed its big mill during the year and is now the heaviest bullion producer in the camp. The centre of production has shifted to the southeast, and fine ore has been encountered in the diabase. The favourable developments in this formation on the O'Brien are the more interesting in view of the ill-success that has attended the majority of other properties that have relied upon diabase veins for their reserves. The various workings are all now connected underground and when Mr. Culbert's plans are complete, the whole tonnage will be raised up the one central shaft and sent over a tramway to the mill. The mill is making a good extraction on about 30 ounce ore. In spite of the heavy charges incident on a large amount of dead work and surface improvements, the O'Brien will make a profit of between $400,000 and half a million.

No Luck in Diabase.

Properties mining in the diabase on Cross Lake and to the east of the great square of the Nipissing have not lived up to expectations. After the cessation of operations for over a year the Colonial has operated its mill and has shipped just short of 200 tons of concentrates this year. It is reported that, as the shaft has been sunk, better values have been obtained, but ounces per ton run low and profits are tenuous. The property is being mined and worked conservatively and given a fair trial. The two producers on Cross Lake are now hunting for new ore bodies. With but a few months' ore reserves for their small mill in sight, the King Edward has accomplished some fine pioneer work in sinking a shaft 500 feet from the top of the cliff above its plant, and has cut one of the veins. It is not too promising. Mr. Glen Anderson will cross-cut to the No. 5, which showed good ore in the winze below the tunnel level. He expects to win fresh ore here, if it is to be discovered at all.

The Silver Cliff, bought by rich Pittsburg capitalists, and equipped expensively, will also have to open up more ore if it is to run the mill on its own ore for many months in the new year.

Expensive litigation and the nonfulfilment of the promise of surface veins underground has been balanced on the Nova Scotia by the excellent record of Mr. Kirby with his big cyanide mill. Once the dispute with the Peterson Lake in relation to the Nova Scotia lease has been settled, as it should soon with the more friendly board of directors, it is anticipated that more ore will be available for the mill. The Nova Scotia has shipped nothing but bullion this year.

The area between the Nova Scotia and the Kerr Lake district has been barren of results.

Prospects at Giroux Lake.

The discoveries on properties in the immediate vicinity of Kerr Lake will swell the ore reserves for the camp. With the single exception of the Silver Leaf, which still deserves the title of the most luckless forty acres in Cobalt, all the properties have done well. While the Drummond has not been successful in delving for new ore bodies on Kerr Lake, the Hargrave has found a new lead for it in the southwest corner of the property.

The Crown Reserve, with a record of 150 per cent. paid on capitalization in less than three years, has still considerable high grade ore in sight, and is developing a large tonnage of low-grade ore in preparation for the time when the mill is completed. It has opened new territory in the north with reassuring results, and the rich section near the Carson has furnished many delightful surprises in narrow, but rich, veins on the upper levels. The Victoria was the premier discovery of the year.

Possibly less is known of the Kerr Lake Mining Company than of any other in camp. It was feared that depleted ore reserves would induce a lowering of the dividend rate in the last quarter of the year, but the pessimists were not justified. In the last few months fine new ore bodies have been cut under Kerr Lake where previously no work had been done, and also near the Hargrave boundary, driving from the old Jacobs shaft. There is little doubt now that the Hargrave has the continuation of the Kerr Lake No. 3 right in its own territory. The vein is well defined, but is fickle in values. The ore bodies found so far are short. Close to the boundary line of the Drummond

the No. 1 vein has yielded practically all the shipments made this year. While this vein has produced some beautiful ore, it only occurs in lenses and no very considerable portion of it is in the Hargrave territory.

To the west of Kerr Lake the Diabase Mountain group have not had a profitable year. Sunk in the abyss of litigation and debt during nearly all 1910, the Cobalt Central in 1911 may have the opportunity of proving a profit-making mine again, as it is reported that all liabilities will be paid off by the new control, and that minerlike methods will be adopted.

The Bailey Cobalt has installed a good plant and opened up new ore bodies. Under skilful management it presents one of the possibilities of the coming year. The Foster has not shown any tendency to "come back."

Gillies Limit Unproductive.

The two Gillies Limit properties with any ore in sight each produced one car of ore from the Waldman vein, but their researches below the fault plane have not been encouraging. Alone of the purchasers from the Ontario Government in all their Gillies Limit sales the Provincial bears the earmarks of a producer. After developing a hundred-foot ore body near the Savage line and mining a high grade car, Mr. Reddington felt justified in erecting camps and preparing to open up his territory on a considerable scale. Adjoining it the Savage now forms a very valuable reserve to the McKinley-Darragh-Savage group. It is now producing steadily at the rate of thirty or forty thousand ounces per month, with excellent possibilities of increasing that rate in the coming year very materially.

South of the Hargrave and north of the Temiskaming and Beaver, there have been no new developments during the year, though there has been very considerable activity. The Rochester stands in a little better position than it occupied at the beginning of 1909, but the very promising indications of permanency shown during the year have not been maintained.

The Beaver has shown the most marked gain among South Coleman properties. The management has evinced disposition to pay less heed to the market and more to the mining of silver. One ore shoot of about 80 feet in length has been practically stoped out between the 200 and the 250-foot levels, but the same vein has been cut and opened up at two places on the 300-foot. Two other veins, discovering nothing but cobalt on the surface, have made beautiful high grade below. It is now reported that a mill will be built, results at the end of the year may prove that with the present ore bodies the step was not entirely a wise one.

The South Coleman Producers.

On the Temiskaming the good profits from the mill and the persistence of high-grade ore on the lower levels have permitted the directorate to resume regular quarterly dividends and pay a bonus. On the 500-foot level a few bunches only of high-grade ore have appeared, but it is thought that one of the principal veins has faulted and will be picked up on a lower level. There is much high-grade on the 400-foot level yet, and the low-grade reserves have only been stoped out as the mining of the richer ore progressed.

The year 1910 was disastrous to companies of purely speculative value, but has witnessed the building up of the district as a centre of industry and production to a degree not imagined twelve months ago by the most sanguine.

THE MINES BRANCH DURING 1910

Written for the CANADIAN MINING JOURNAL.

The following is a brief account of the field work and other investigations carried on by the Mines Branch of the Federal Department of Mines, during the past year:

The investigation of the handling, storage and use of explosives, instituted in 1909, was continued. Capt. A. P. H. Desborough, one of His Majesty's inspectors of explosives, was invited to visit Canada to consult with the Government with regard to proposed regulations to govern the manufacture and storage of explosives, and with respect to the establishment of an explosives testing station. Captain Desborough, accompanied by Mr. Joseph G. S. Hudson, visited nearly all of the Canadian explosive factories and distribution depots, where high explosives are stored, in order to study the existing conditions in this country. Captain Desborough's report and recommendations will appear in the summary report of the Mines Branch.

The number of casualties which have occurred in using high explosives and the great loss of life and property resulting from explosions in magazines, in which high explosives are stored, have recently emphasized the pressing necessity for a thorough investigation of the matter to be followed by legislation regulating the manufacture, handling, storage and use of high explosives.

The gathering of information for a special bulletin on the copper resources of Canada was continued by Dr. Alfred W. G. Wilson. During the past season he visited numerous localities in Ontario and the Maritime Provinces.

The commercial processes for using pyrites as a source of sulphur, are also under investigation by Dr. Wilson. Pyrite burning is of special importance at the present time with respect, both, to the sulphite pulp industry and in the preparation of mineral fertilizers. Sulphur is now imported for use in these industries, while the bulk of the pyrites ore mines in Canada is exported. The introduction of a satisfactory process for recovering the sulphur content of these ores for such purposes as above mentioned would open a home market for our undeveloped pyrite resources and for pyritic ores of low copper content.

Magnetometric surveys were carried on in Ontario, New Brunswick and Nova Scotia during 1910.

Mr. Einer Lindeman extended the surveys already made at Bathurst, N.B., and at Bessemer, Ontario, and also made topographical surveys of these localities.

Mr. Howells Frechette made a magnetometric and topographic survey of a part of the Torbrook iron range, Nova Scotia.

Mr. L. Heber Cole, recently appointed to the department, spent the latter part of the summer in the Cobalt and Porcupine districts obtaining information regarding the mining operations there.

During the past summer Dr. T. L. Walker, of Toronto, continued the work he has been doing for the Mines Branch in investigating the molybdenite resources of Canada. He examined numerous properties

in Ontario, British Columbia, Quebec and New Brunswick.

The ore testing plant for experimental investigation into methods of concentrating magnetic iron ores is now in operation under the supervision of Mr. George C. Mackenzie. The equipment consists of one complete unit of the Grondal concentrating apparatus, including one Blake crusher, one Harding ball mill and two Grondal separators arranged in tandem. Experiments are being made on various Canadian magnetites in lots of from 5 to 50 tons. The problem of economical concentration is of great importance on account of the very large number of deposits of magnetite in Canada, too low in iron content for the direct use of the iron masters. The ever increasing demand for iron ore and the limited amount of high grade ore in sight emphasizes the importance of converting these low grade magnetites into stock suitable for iron making.

The problems of developing a commercial process or processes for the production of zinc and zinc products from the complex Canadian zinc ores have been under investigation by Dr. Haanel, Mr. W. R. Ingalls, of New York, and Dr. Alfred Stansfield, of McGill University, Montreal.

Mr. F. W. Harbord, of London, England, has been engaged to investigate electro-thermic processes invented recently in Europe for the production of spelter and zinc oxide.

Mr. Hugh de Schmid visited most of the mica properties of Ontario and Quebec, gathering data for a on mica.

Dr. Wm. A. Parks, of Toronto University, has been collecting data for a special report on the building and ornamental stones of Ontario. This will be the first of a series of monographs on Canadian building stone, to be issued by the Mines Branch.

The installation of a peat gas producer, gas engine, dynamo and other apparatus was completed during the summer at the Fuel Testing Plant in Ottawa. Several tests have already been made by Mr. B. F. Haanel, on peat from the Victoria Roads peat bog and the Government bog at Alfred, Ont. At present a second gas producer is being installed in order to extend the scope of this plant to the testing of lignite and bituminous coal.

The Government peat plant on the bog at Alfred, Ont., was in operation under the supervision of Mr. Aleph Anrep, Jr., for about two and a half months, during which time 1,600 tons of peat were produced. More than 600 tons were sold at Alfred and Ottawa for domestic use, the remaining quantity being required for the operation of the fuel testing plant. The bog at Alfred was visited by the members of the American Peat Society in July, a special excursion being made from Ottawa, where the society was then in annual session.

In addition to the work at Alfred, Mr. Anrep made a thorough examination of the Holland peat bog at Bradford, Ontario, a bog 16 miles long and up to two miles in width.

Statistics of mineral production during the calendar year 1909 were collected by the Division of Mineral Resources and Statistics under the direction of Mr. John McLeish and a preliminary report thereon was issued on March 1st. Mr. C. T. Cartwright spent some time visiting clay manufacturers and quarry operators in Ontario collecting statistics of production, etc. A complete and revised report on the mineral production in Canada during the calendar year 1909 has been prepared and special bulletins on the production of iron and steel, coal and coke, and on cement, lime, clays, stone, and other structural materials have been separately issued. This division is now engaged in the collection of statisties of mineral production during the calendar year 1910, and the active and prompt co-operation of all mining operators, brickmakers, quarry owners, etc., is urgently desired to ensure an early compilation and publication of results.

The usual routine work has been carried on in the Chemical Division under Mr. F. G. Wait.

The following reports were issued during the year 1910:—

47. Iron ore deposits of Vancouver and Texada Islands. By Einer Lindeman, M.E.

55. Report on the bituminous or oil shales of New Brunswick and Nova Scotia; also on the oil shale industry of Scotland. By Dr. R. W. Ells.

58. Annual report of Division of Mineral Resources and Statistics on the mineral production of Canada during the calendar years 1907 and 1908. By John McLeish, B.A.

59. Report on the chemical analyses made in the Mines Branch Laboratories, during the years 1906, 1907 and 1908. (Appendix—Commercial Methods and Apparatus for the Analyses of Oil Shales, by H. A. Leverin, Ch.E.) By F. G. Wait, M.A.

62. Preliminary report on the mineral production of Canada during the calendar year 1909. By John McLeish, B.A.

63. Summary report, 1909.

67. Bulletin No. 2, iron ore deposits of the Bristol mines, Pontiac County, Que. By Einer Lindeman, M.E., and magnetic concentration of ores, by George C. Mackenzie, B.Sc.

68. Bulletin No. 3, recent advances in the construction of electric furnaces for the production of pig iron, steel and zinc. By Eugene Haanel, Ph.D.

71. Bulletin No. 4, investigation of the peat bogs and peat industry of Canada, 1909-10. By Aleph Anrep, Jr.

79. Production of iron and steel in Canada during the calendar year 1909. By John McLeish, B.A.

80. Production of coal and coke in Canada during the calendar year 1909. By John McLeish, B.A.

85. Production of cement, clay products, stone and other structural materials, in Canada during the calendar year 1909. By John McLeish, B.A.

The following reports are at present in press:—

69. Chrysotile-Asbestos: Its Occurrence, Exploitation, Milling and Uses. (Second edition, enlarged.) By Fritz Cirkel, M.E.

82. Magnetic concentration experiments. Bulletin No. 5. By George C. Mackenzie, B.Sc.

84. Gypsum deposits of the Maritime Provinces of Canada—including the Magdaline Islands. By W. F. Jennison, M.E.

Nova Scotia's coal output was larger during 1910 than in 1909.

Crude No. 1 Canadian feldspar fetches a high price in the United States. It sells for $5 per long ton at Trenton, N.J. The ground brings $10.50 per short ton. No. 2 Canadian crude, on "standard," brings from $5 to $5.25 per long ton; the same grade, when ground, sells for from $9 to $9.50 per short ton. The various grades of United States feldspar range from $2.50 to $4.50 for crude, and from $5.50 to $9 for ground. The Canadian feldspar, as shipped to the United States, contains 71 per cent. of potash feldspar (orthoclase).

THE MARITIME OILFIELDS, NEW BRUNSWICK

[EDITOR'S NOTE.—We have made frequent reference in these columns to the new gas and oil fields near Moncton, New Brunswick. In our editorial review, January 1st, there occurs a misprint. The discoveries are referred to as being near Bathurst. This, of course, was one of those inadvertences that it appears impossible to avoid once in a while. They grieve the editor, who, in turn, tries to grieve the printer.

The following facts concerning the wells are of much interest:

The work of the Maritime Oilfields Company, in the Stony Creek field, Albert County, New Brunswick, has brought excellent results. The field exploited is small, being only a mile wide from north to south, and two miles long from east to west. The oil wells shot have a total daily capacity of 50 barrels. The total flow of gas from all the wells is estimated at about 40,000,000 cubic feet per day.

This announcement will come as a surprise to most of our readers. The exploitation of this field was undertaken by Dr. J. A. L. Henderson, of London, England. From the first, the task of opening up this extremely productive field was beset with difficulties. But nothing has daunted the enthusiasm of Dr. Henderson. He is blessed with a level head, and clear business perception. And he and his company have been rewarded beyond their most sanguine expectations.

Contracts have been entered into with the city of Moncton to supply power for the lighting of the city, for fuel gas, and for the proposed new tramway. The laying of pipes will be commenced early in the spring. The distance to Moncton is only ten miles.

Moncton, a city of about 15,000 population, is a growing manufacturing centre. The large shops of the Intercolonial Railway are situated there. Other considerable industrial plants also have Moncton for their home. The country surrounding is rich agriculturally. The bringing in of a plentiful supply of cheap fuel will, without doubt, give a tremendous impetus to the city and to the surrounding district.

Only a minimum quantity of oil is being pumped—enough merely to prevent flooding of the gas sands. A few notes on each well are here appended:

No. 1 well was started about two years ago. It was abandoned at 1,220 feet.

No 2 well, 11 miles from Moncton, was abandoned in October, 1909, at 2,400 feet.

No. 3, at Stony Creek, 10 miles south of Moncton, was the first producer, yielding 300,000 cubic feet of gas per day, and two barrels of oil.

Well No. 4 was drilled on the Westmoreland side, but no productive sands were found to a depth of 1,675 feet. All further operations have been confined to Albert County.

Well No. 5 at Stony Creek, was the first big gas producer, its capacity being now placed at 2,000,000 cubic feet per day with a pressure of 105 pounds per square inch. It also yields two barrels oil daily. (This is the well from which the company gets its gas for power and after using for over a year, the production is greater than when first shut in.

Well No. 6. north of No. 5, proved to be a "crooked" hole and was abandoned at 1,320 feet.

Well No. 7, drilled to a depth of 1,990 feet, has an oil capacity of 8 barrels per day and 125,000 feet of natural gas.

Well No. 8, at a depth of 1,680 feet, has a natural gas capacity of 1,600,000 feet per day and shows good indications of oil, but owing to the strong flow of gas, the pressure being 200 lbs. to the square inch, it is impossible to torpedo the sands.

Well No. 9 is a small gas producer, and shows a yield of 5 barrels of oil per day. Salt water interfered with drilling at a depth of 2,060 feet.

Well No. 10 has a natural gas capacity of about 380,000 feet per day and yields about 4 barrels of oil per day.

Well No. 11 was abandoned at 1,250 feet, owing to the breaking of the drilling cable which could not be recovered.

Well No. 12 has a gas capacity of 3,695,000 cubic feet daily and a pressure of 610 lbs. per square inch with a good show of oil, not torpedoed.

Well No. 13, gas capacity 786,000 feet, pressure 200 lbs. Good showing of oil. Capped at 1,595 feet.

Well No. 14 is the king of the gas producers, the test showing 10,000,000 feet daily, with a pressure of 475 lbs. At a depth of 1,480 feet the flow of gas was so strong that it was impossible to continue drilling and the well was capped.

In wells Nos. 15 and 16 there was the same experience, the gas pressure being too great between 1,400 and 1,500 feet to admit of drilling.

The capacity of these wells is as follows: (15) 6,500,000 feet, pressure 285 pounds; (16) 9,500,000 feet, pressure 350 pounds.

Work is now proceeding on wells 17 and 18. In No. 17 drilling was commenced in October and the hole is now 1,950 feet deep with a good showing of oil and a strong flow of gas. No. 18 is down 2,175 feet, operations being commenced November 14th. It is understood the company will continue operations all winter.

SUMMARY OF WORK DONE AT NIPISSING AND LA ROSE FOR 1910

(Written for the CANADIAN MINING JOURNAL by R. B. WATSON.)

The year 1910 has been a prosperous one for Nipissing and La Rose as well as for the Cobalt district in general.

The camp's tonnage and ounces of silver shipped will both show an increase over 1909.

The tonnage shipped does not reflect accurately the prosperity of the camp, as the mills are now treating a considerable part of the low grade ore which formerly went to the smelters; much progress has been made in this direction during the year and the time is approaching when very little except high grade ore and concentrate will be shipped to outside reduction works. Bullion is being produced by several cyanide plants, with

or without amalgamation, and the next step to look forward to is the production of bullion from the high grade ores.

This is the history of most mining camps but the complex nature of the Cobalt ores has retarded this logical development.

There has been a further slump in the price of cobalt oxide which resulted in a prompt change of schedule by the principal Canadian smelters cutting off all payments for cobalt. The mines are now receiving no revenue from the cobalt contents of the ores except on the small tonnage shipped to Europe.

Working conditions have improved since the arrival of power in the late spring.

There are now two power companies supplying compressed air and two supplying electric power.

The latter service has been quite satisfactory; and while the air power has been subject to more frequent irregularities, due to the starting up of a new plant, these initial difficulties will doubtless soon be overcome and the result is a service of great convenience.

The air supplied by the hydraulic plant is somewhat deficient in oxygen, so that a candle does not burn freely in a face where there is no natural ventilation. No bad effects, however, have been felt by the men working in this air as far as noted. Acetylene lamps are used in place of candles; they give a better and cheaper light and will probably replace candles throughout the mine, even where they are not necessary.

The shipments of the Nipissing Company for the year will be about 6,600 dry tons, containing 5,500,000 ounces of silver. During the month of December alone the shipments will amount to about 850,000 ounces. This is the largest number of ounces ever shipped in one month by the company and the year's results show a substantial increase over 1909.

The principal veins which have yielded this product are the four veins in the Town of Cobalt, namely No. 64, No. 73, No. 80, and No. 100, together with No. 63 (Kendall), No. 26, No. 122, and No. 54 on the east side of the lake.

The deepest working on the property is on Vein 64, where a considerable amount of development has been done on the 270-foot level and above. Several good ore shoots have been found and a winze is now being sunk to the 350-foot level.

This vein is the strongest fissure yet opened up on the property; it has been drifted on for some 800 feet and appears to be as strong in the Keewatin as in the overlying conglomerate—although the ore so far found has been in the latter formation. It will be explored in depth in hopes that the Keewatin here will give as favourable results as have been obtained in this formation at several places in the southern part of the district. The Keewatin is being looked upon with less suspicion than heretofore.

The best new ore body of the year is on the 160-foot level of vein 73, where there is high grade ore for a length of 250 feet, with an average width of six inches. There is also another parallel stringer of good ore 150 feet long and two inches wide. Very little stoping has been done on this level; nor has it been necessary to draw from the big ore shoot on the first level.

Veins 80 and 100 have produced a large tonnage from the stopes above the 70-foot level; both veins have been located on the 190-foot level.

On the Kendall vein (No. 63) a new level has been driven at a depth of 225 feet, where stopes will be started in both the main vein and the cross vein. A new vein which promises well has recently been found in a cross-cut on the 145-foot level.

No stoping has been done on vein 122, which is now being developed on the second level.

Two new shafts have been sunk in the Keewatin; one near the O'Brien line; the other in the southwest corner of the property next to the Gillies Limit. These will explore several veins showing rich ore on the surface.

A small jigging plant is being installed for the treatment of the large tonnage of screenings heretofore shipped to the smelters; the tailing from this will go to the Nipissing Reduction Company's concentrator to be treated with the low grade ore from vein 63.

It is hoped that a complete method of treatment for the large amount of low grade ores now on the dumps and in the mines, will be worked out at the small experimental plant now under construction.

La Rose shipments for the year will approximate 5,040 dry tons, containing 3,400,000 ounces of silver.

A large amount of development and exploration has been done with very satisfactory results. This work has been confined to La Rose, Lawson, and Princess properties, with some surface and underground prospecting on the Fisher-Eplett group in the south end of the district.

At La Rose proper a new vein was discovered lying west of the main vein and on which an ore shoot some 250 feet long has been blocked out.

Several of the cross-veins have been producing well; the best of these is No. 3, now being developed on the 235-foot level. This vein passed from the conglomerate into Keewatin at about 100 feet and represents one of the few instances where the rich ore continued into the lower formation.

The Princess mine has yielded steadily and is turning out to be a valuable bit of territory. A number of new veins have been found and the lot will be systematically prospected for others.

The Lawson mine made a bad beginning but is now redeeming itself, after a period of steady exploration. A very interesting development has taken place recently in No. 8 vein—a wide calcite filled fissure which runs for many hundred feet across the property. The outcrop yielded only a few bags of ore and on the 88-foot level there was practically nothing. The shaft was then sunk 100 feet deeper into the Keewatin, where a beautiful ore shoot of 5,000 ounce ore, eight to ten inches wide, was found. This ore body has yielded $160,000 worth of ore during the last two months in taking out sufficient ground for the stope timbers. The finding of high grade cobalt ore at depth in the Keewatin, under a calcite outcrop, suggests large possibilities not only for this ground but for other veins in the district.

Shipments from La Rose properties have shown a falling off in tonnage due to the fact that practically nothing is now sent to the smelters except first-class ore and concentrate. Jigging plants have been installed which extract the heavy mineral from the screenings produced by the bumping tables, and the jig tailing then goes to the concentrator.

The Northern Customs Concentrator is treating 100 tons per day of La Rose second class ore and is enlarging its mill to take care of the excess which is now going to the dumps.

Cobalt shipped about one hundred thousand ounces of bullion during 1910.

OUR BRITISH LETTER.

The General Election and the Markets—A Modderfontein Surprise and Some Developments—Electrical Hoisting on the Rand—Rhodesia's Rise—A Country with a Big Mining Future—Welsh Miners' Strike—Conditions in Welsh Collieries—Gold Mining in Russia.

(Exclusive correspondence of the Canadian Mining Journal.)

With a general election in progress markets, mining or otherwise, have shown no special activity. The connection between politics and the markets is close—perhaps closer than it need be. The Liberal Government will return to power with practically the same majority that it had in the old Parliament, and as the Liberal Government is not particularly favoured by the investing and monied classes markets have tended towards depreciation following close upon the lead of Consols. In the new House of Commons, however, finance and its mining subsections will be again well represented.

The South African market has of late had one or two adverse circumstances to contend with, chiefly relating to Rhodesian companies, which have affected the market as a whole. The unexpectedly good Modderfontein dividend announced on December 13th was therefore an agreeable surprise. Estimates had been current that only $1.50 per share would be distributed, or the same as for the June half of the year, but the actual announcement is $2 per share, or 10 per cent., making 17 1-2 per cent. for the year to December 31st next, as compared with 12 1-2 per cent. for the corresponding period previously.

Modderfontein shares, on this announcement, improved appreciably, to nearly $60, which is about $5 above the lowest of the year, though fully $11.25 below the highest. The company owns a very large claim area, and a considerable reduction effected in the working costs has made it possible to utilize a large quantity of ore which previously had been discarded as worthless. For instance, in 1906 the chairman roughly estimated that about 25 per cent. of the area contained non-payable ore deposit, which made the total contents equivalent to 18,400,000 milled tons. More recent estimates placed the figure at over 23,000,000 tons, and an unofficial but expert estimate further raised this figure.

On January 1st last it was estimated that by using one million tons per year the mine would have a life of about 21 years. The reduction in the working costs and consequent increase in the profits—that is, treating the same quality of ore—is indicated by the fact that for the year to May 31st, 1906, the profit per ton of ore treated was $1.66, whereas for the year ended 1909 the figure had risen to $3.36. The issued capital is $7,000,000, in shares of $20 each, which, on the basis of the latest dividend yield a purchaser about 5 7-8 per cent. As in mining investments it is reckoned that the return should be at least 5 per cent., plus the amount necessary to write off the investment during the estimated life of the mine, it would seem that the shares are fully valued, except on the inference that the dividend will be further raised.

There are several interesting features in connection with the electrical hoisting equipment of the Rand Collieries, which are now being actively developed as a gold mine, though floated originally as a coal mine. At the Rand Collieries there are two shafts, but work is more advanced at No. 1. For this shaft there are two hoists, one capable of lifting six tons and the other three tons of rock. The drums are of the cylindro-conical type, which are directly coupled to direct current separately excited motors, being supplied with current from variable voltage generators. Special provision is made in the electrical equipment to ensure safe working. In order to obtain the best results there are continuous current machines fitted with auxiliary poles and compensating winding on the main poles.

The power will be supplied from the Victoria Falls at 10,000 volts to a transformer-house, where it is converted into 6,000 volts, to which pressure the induction motors driving the control generators and the pump motors, etc., are connected. The direct current generator from the 6-ton hoist is capable of giving any pressure from zero to 800 volts, positive or negative. The control generator from the 3-ton hoist is wound for a maximum pressure of 400 volts only. The company's engineers are confident that hoisting costs by these hoists, to be installed at the two vertical shafts, will not exceed six cents per ton, as compared with from 25 cents to 30 cents per ton on most deep level mines where steam power is used. It is also confidently believed that milling costs, with a reduction plant of the very latest design to be subsequently erected, will be very considerably below the present level on the Rand by reason of the much higher duty per unit, vastly improved facilities for working, and the lower running and maintenance costs consequent upon the electrical drive.

In the matter of Rhodesian mining there is a gradual increase in public confidence to be noted on the whole, and Rhodesia, once the Cinderella amongst mining companies, is gradually forcing its way towards a consistently increasing output of gold. The Chartered Company, which rules Rhodesia, is slowly learning the lesson of its errors of past control. Already Rhodesia's gold production amounts to about $12,500,000 annually and the colony remains for the time being as it began, a mining country. Geologically speaking, the high veld, as the great stretch of rolling plains and tree-clad ridges are termed, is made up of old metamorphic rocks into which have been intruded great masses of granite. The granites themselves, though affording splendid building stone for future generations, are of little economic importance. In the schist belts, however, and especially along or near their contact with the granites, gold reefs are frequently met with, as well as deposits of other minerals. No particular district seems to be specially favoured; first one and then another may become the centre of attraction to the prospector for the time being. There are, moreover, no long lines of reef, and it cannot be demonstrated that any two important producing mines are situate on the same lode. Whether this want of concentration is an advantage or a disadvantage is open to argument.

Historically considered, Rhodesia's mining is based upon various discoveries with regard to ancient workings and the story of the colony has not been marked by any of the great "finds" of large nuggets or rich outcrops that have marked the early days of great auriferous areas. It is clear that an ancient race carried on extensive gold mining in Rhodesia, old workings and implements being found over large stretches of the country. Rhodesia's reefs were formerly not believed to "go down," but recent returns have dissipated this old idea, some workings now reaching a depth of 1,700 feet. The industry has now got into a good swing and within the next few years a series of new

discoveries is confidently anticipated, especially of ore bodies untouched by the ancients, now that an era of genuine prospecting has set in.

The Welsh coal miners' strike, which has affected more than 30,000 men and has at times been marked by rioting of a kind practically hitherto unknown in this country's labour struggles, is quieting down. The Board of Trade is lending its help with a view to securing a settlement and at last those insurgent miners who were refusing to obey the orders of their own union and the Welsh Miners' Federation, are exhibiting a more conciliatory attitude. Numbers have returned to work by arrangement with their union. The trouble in South Wales is of long standing and is not the straight-out question of wages and hours of labour that most labour disputes are.

About half the men employed in a mine are at work in actually winning coal, being called hewers or colliers; and the rest are employed in haulage, maintenance, and supervision, or about the surface. The colliers are nearly always paid by the piece, the rest by the day. The present dispute concerns the colliers alone directly, the other classes of workers having struck in sympathy.

Each hewer is assigned a certain length of the face of coal—his "stall," as it is called—which he has to work, either with the help of a boy, whom he pays, or in partnership with another man, the two dividing the earnings. The hewer fills his tram, chalks his number on it, and at the surface it is weighed and tipped over a screen into the railway truck. The small coal falls through the screen, is separately weighed, and discharged into another truck. The weight of large coal hewn is thus ascertained, the miner not being paid for small coal in most of the collieries of South Wales.

The percentage of small coal depends partly upon the skill of the workman, and partly upon the condition of the coal, whether it is soft or hard, or has been crushed by earth movement; and it is evident that the piece-rate per ton of large coal won must be adjusted to make fair allowance for the proportion of small coal which a good workman must inevitably produce. When bands of stone occur in the coal, or loose under the roof, the extra work they give is paid for by an additional tonnage rate agreed upon between the fireman (who acts as foreman, besides testing for gas) and the collier. Various other kinds of work, such as setting props to support the roof and packing waste stone into walls, are paid by the piece. As far as possible permanent rates are agreed upon for all these tasks for each seam of coal, but when the conditions are very variable, there is often difficulty in deciding what rate to apply, and the rates in the official price list not infrequently prove too low. Then the question of an extra allowance arises.

Since the men maintain a check-weigher to verify the owner's weighings, no dispute can arise as to the payment for coal hewn; but it is otherwise in regard to extra payments, in regard to which there seems to be no proper system of record and verification. Bargains between the fireman and a collier are sometimes forgotten, or occasionally, perhaps, wilfully suppressed by the former when he finds he has made total allowances beyond the sum permitted him by the manager. But there are other grave abuses connected with these extra payments and with the allocation of men to particular stalls, such as favouritism, propitiating of committee-men with higher allowances, and bullying the weaker or needy men into accepting lower rates.

A most objectionable feature of the present system is the dispute which occurs on fortnightly pay days, a knot of men remaining behind to demand allowances which they believe are due. After many attempts they may get an interview with the manager, or they may have to rely on the men's committee of the pit, who take up numbers of cases every fortnight. In many cases the allowances are ultimately granted, sometimes after several weeks; but so far as I can ascertain the granting of them is very arbitrary, and depends a good deal on importunity. The earnings of Welsh adult miners vary from 50 cents to four dollars per day and it can be understood that disputes are quite likely to occur even with good feeling on both sides.

The importance of the gold mining industry in Russia is one that is well recognized. A correspondent informs me that at a recent meeting of mining engineers, Herr S. A. Gumnitsky gave an address on the position of the dredging industry in Russia, or, rather, ten years of the dredging industry in the Yenissei district. It appears that the winning of gold by dredging has been in operation in the district for just ten years, and in this respect stands out prominently as compared with other gold districts. The lecturer said that the dredges had been in use long enough for a judgment to be passed on the comparative merits of the various types used, and, of course, of their comparative demerits, if any. The question has become a serious one in view of the fact that the gold industry in the Yenissei district is passing through a very serious crisis. One of the causes of this, he said, was the dearness of labour, particularly during the past few years, and then there has been the appreciation in the value of provisions of all kinds, and, finally, the weakening of the richness of the gold content in the sands, and so on.

He went into detail on the respective merits of the various types of dredges in use on the fields, including the New Zealand, American, Neviansky, and Putiloff types. Those used in the district do not differ, he said, essentially from the type of the Neviansky, and criticizing certain defects in the construction of some of them, he thought these were properly referable to the nature of the ground they had to work, and that the fault in no way lay with the makers, for these had in every case scrupulously followed the instructions of the users.

Idleness and necessity have forced the Urals mining workmen to return to their original occupation—the search of gold in their own grounds. They wash gold in the Neviansky factory and find it also in the well-known Nizhne Tagil area, and they have even discovered in their back-yards and orchards deposits of rich iron-stone and in great abundance. In a word, there is no work in the closed Urals factories, so the workmen are after gold and metals where they did not think it worth their while before. Gold is still to be found in many places. "I know in the Northern Urals," says my correspondent, "in one vilage, that of Ivdel, on the bank of the River Ivdel, where not only is gold found in the orchards of the inhabitants, but the very church, although far from the river, is built on auriferous ground, and I have seen, when there, every time that a grave was dug in that northern latitude, without fail, they struck a rich bed of sand where even nuggets were found. An effort to exploit the gold for the benefit of the church fell through."

Coal Mining in Nicola Valley and Smilkameen Districts, B.C

Now that these southern British Columbia districts are accessible by railways, the development of some of their resources is being proceeded with. Prominent among the activities that are taking place is coal mining, which in Nicola Valley is becoming important, while in the Similkameen it is still largely in the prospect stage. However, much development is being energetically undertaken, and in two or three instances surface equipments are being provided, so that shipment of coal from these new properties may be made before the current year shall close.

Nicola Valley.

Nicola Valley Coal & Coke Company, Limited.—This company owns and operates the Middlesboro colliery, in Nicola mining division. During last year work was done in mines Nos. 1, 3, 4 and 5, and a production of about 158,000 short tons of coal was made. In No. 1 the development work in progress in 1909 was continued, and a second slope was opened. In No. 3 the seam, which is small in this mine, was developed; a rock tunnel connects the mine with No. 2. No. 4 mine has been developed to an output capacity of about 200 tons of coal a day. In No. 5 the workings were further extended. A new fan, with a capacity of 150,000 cubic feet, is being put in, and preparations are being made to considerably enlarge the surface by installing next spring a modern equipment of much greater capacity than that now in use.

Transportation.—The construction of the Kettle Valley Railway, now in hand, will add to existing transportation facilities, which are afforded by the C.P.R. Company's line from the mines to Spence's Bridge. When the new railway shall be completed to the Boundary district a large and easily accessible market will be opened to the coal mines of Nicola Valley. The Kettle Valley line runs for four miles within the bounds of this coal company's property. Mr. Charles Graham, formerly with the Western Fuel Company, Nanaimo, was lately appointed superintendent for this company.

There are several other coal properties in this district on which development work has been done, and some of them are stated to give promise of proving producers.

Similkameen.

Princeton Collieries, Limited.—This company controls about 12,300 acres of coal lands near Princeton. Plans for a modern 500-ton tipple are being prepared, and it is stated that development work will shortly be begun on an 8-foot seam which outcrops near the Tulameen River. Railway transportation will be available, and it is intended to energetically develop this property.

Princeton Coal & Land Company.—This is an offshoot of the old Vermilion Forks Mining and Development Company, which has held land, mining, and townsite interests for years. In December, 1909, production was commenced, and the output was 150 tons. Since then railway communication has been established with the Boundary and Spokane. Last year's production was between 11,000 and 12,000 short tons. The main incline on the dip of the seam is down 450 feet and numerous cross-cuts and levels have been driven. A 50 h.p. steam boiler and hoist operate single rope haulage. Other improvements made recently include the erection of several mine buildings.

Osoyoos Coal Company.—The occurrence of an 18-foot seam of coal of excellent quality on this company's property is reported, but it has not yet been extensively developed. Men were employed during recent months opening this coal, and the prospects are stated to be good for permanent and profitable development.

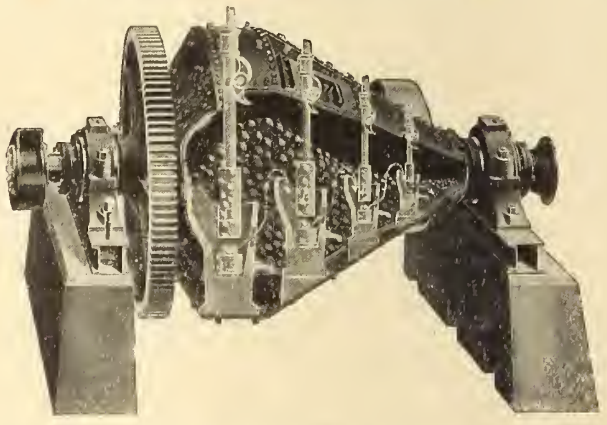
Columbia Coal & Coke Company.—This company holds 10 square miles of coal lands, extending from Granite Creek six miles to the Tulameen (Otter Flat). Last summer 35 to 50 men were employed exposing the various seams, of which it is claimed there are six that are workable. The designing and installation of plant to eventually have a coal-handling capacity of 2,000 tons a day, has been contracted for by a Chicago firm of engineers.

Gravity Stamps Obsolete

By H. W. HARDINGE.

In the rhythmic dropping of the stamps to the old mill man, there is as much harmony as in musical tone to the musician. A discord is produced in the ear of the former when the feed of the battery allows metal to strike on metal. The disquieting note is as detectable above the din to his practiced ear as a false note in an orchestra to the leader.

It is, perhaps, for this reason that the mill man loves his noisy pets and is loath to accept innovations; but they are as sure to come as other advances in metal-



lurgy. It is only a few years since cyanide largely replaced amalgamation in gold milling and the tube mill took the place of grinding pans. We must give way to advancement, and the more experienced metallurgist, who is willing to recognize new features in ways and methods, will keep up with his younger competitor who is not hampered with too much obsolete knowledge. Better be ignorant than learned in methods out of date.

Only within a very short time the South African engineer has broken away from the use of fine screens on his batteries and is now using screens of larger openings than was before thought practicable. He is also modifying weight, height of drop, and drops per minute, to meet the requirement of dealing with the problem of economy necessitated by the lower grades of ores encountered. Less than a year ago the writer in conversation with one of the most successful mine managers and metallurgists in the Cobalt district, suggested that he change his 20-mesh battery screens to 10-mesh; but an objection was made that such a screen would be too coarse. He, however, was alive to possibilities, and we ascertained within the past few days that he has "gone us one better," for his batteries are

now equipped with slotted screens of four times the aperture area of our suggested 10-mesh. The result is that he has doubled his stamp capacity, and his "oversize" is easily taken care of by his pebble mill without any additional increase in power consumption over the same method when the stamps were endeavouring to crush sand by pounding it upon a previously prepared bed of sand on his stamp die. If, then, the stamp is a better coarse than fine grinder or reducer, would it not be well to discard it altogether and employ a machine especially adapted to fine crushing?

A representative of one of the largest manufacturers of mining machinery in the world, writing upon this same subject, and referring to different methods of crushing, appears to give preference to Chile mills and ball mills, even of the older type; and in this connection says, as is true, "there is no work for the gravity stamp which cannot be done better by either of the other coarse crushers."

The writer, in his metallurgical practice, recognized this fact several years ago and in his effort to remedy the defect, through an application of a combination of machines, invented a new type of ball mill embodying the features of automatically adjusting the power to work, i.e., utilizing a large ball to crush the larger pieces in the largest diameter of the mill, and successively smaller balls in the zone of the lesser diameter and lesser weights of balls as well as gradually reducing peripheral speeds, thus relatively taking the place of gradually reduced weights of stamps with lighter and fewer drops per minute. This idea we have endeavoured to illustrate graphically in the accompanying cut of a mill automatically adjusting power to desired work.

The small mill shown has a capacity equal to 15 to 20 stamps and the total cost of mill complete hardly amounts to the cost of foundations for the stamps. It is operated without screens and is as effective as simple. As a further illustration of the unnecessary work put upon the stamp, let us suggest a consideration of this work. For instance, a 2-inch cube of ore beneath the stamp shoe signifies the kind of work that such a machine should do. It will effectively reduce this piece of ore in a single drop so that its resulting particles will average less than a diameter of 1-4 inch, or a reduction of over 500:1. Then the logical sequence of size of the next reducing medium should be in the same ratio to the particle undergoing further division. This would reduce the weight of the stamp in the same proportion, necessitating a "stamp" weight of about 2 pounds. This effect is easily obtained by employing a small 2 1-2 inch or 3 inch ball, and instead of a single stamp we have hundreds of this size of "stamps" for further reduction, acting upon a multiplicity of relative sized particles, a plausible and mechanical result to be attained. Thus, we use a sledge hammer upon a spike and tack hammers upon a tack.

In another short article, we may have something to say in reference to amalgamating gold ores in pebble and ball mills, which idea, at first thought, will not be viewed without considerable questioning by the older millman on account of "flouring" of the quicksilver. It, however, in spite of opinions to the contrary, is being successfully done in the conical pebble mill.

Nova Scotia Steel and Coal Company

The Record of a Prosperous Year.

The year 1910 was one of record outputs and general expansion with the Nova Scotia Steel and Coal Company. Every department of the company's varied works set a new record for production, while the additions and improvements that were made in nearly all the departments will make possible even better production in the future.

At the Wabana iron mines, perhaps greater improvements were made than at any of the other properties. The submarine slopes were further advanced 1,500 feet and are now nearly 7,000 feet from highwater mark. Boreholes sunk to the lower bed from the slopes on the upper seam showed a very marked increase in the richness and thickness of this underlying one. A large amount of equipment was put in here during the year. A Fraser and Chalmers first-motion duplex steam hoisting engine, said to be the most powerful of its kind in British North America, was installed; a new deckhead and a belthouse, with many labour-saving devices were erected; and the hoisting slopes were laid with 80-pound standard section steel rails.

An electrical power plant consisting of Belliss and Morcom triple expansion condensing engines operating Brown Boveri generators was installed adjoining the shipping pier. This plant will supply power for all the operations at the piers and by a transmission line across the island will furnish the electrical power required at the mines. A coal discharging tower was constructed adjoining the electrical plant, work begun on a new ore pocket and sixteen houses were constructed.

R. E. Harris, Pres. N.S.S. & C. Co.

At Sydney Mines the blast furnace and three of the open-hearth furnaces were remodelled and relined during the early summer and the improvements effected then have greatly increased their production. For the past six months their outputs have exceeded those of any other furnace of similar capacity. The usual renewals and replacements were made at the collieries and 76 houses were constructed for employees.

Important additions were made at the New Glasgow works. The new buildings with a combined length of over a quarter of a mile, were erected. One will house the spike, bolt and nut, rivet and polished shafting departments, while the other will replace the shipping building. The combined 16-inch and 9-inch mill installed some fifteen years ago, having become inadequate to the work required, was replaced by separate

18-inch and 9-inch mills. To supply the additional power required an electric power generating set of 2,000 h.p. driven by turbines to be operated by the exhaust steam from the present cogging mill and bar mill engines is now being built in Great Britain, and will shortly be installed, the foundations for which and building to house same being now completed and ready for the erection of this plant.

The progress of the company during the past year is best shown by the following table of outputs, number of employees, etc., in 1909 and 1910:

	1910.	1909.
Iron ore mined	537,000	460,387
Coal mined	845,000	813,453
Limestone and dolomite quarried	75,000	74,407
Coke made	90,000	87,816
Pig iron made	66,000	57,676
Steel ingots cast	75,000	64,240
Steel billets cogged	59,000	52,931
Bars and plate rolled	49,000	45,090
Axles forged	34,000	27,703
Shipments of finished steel and forgings	60,200	58,515
Pay roll	$2,825,000.00	$2,480,226.91
Average number employees	5,276	4,450
Average at collieries	2,656	2,285
Average at I. & S. Dept.	860	685
Average at New Glasgow	900	770
Average at Wabana	860	710
Steamers employed	18 to 20	15 to 20
Tonnage freighted	1,000,000	925,000

The Canada Iron Corporation, Limited

Progress during 1910.

At the request of the CANADIAN MINING JOURNAL, the following brief review of progress has been forwarded by the Canada Iron Corporation, Limited:

The iron ore mine in the County of Gloucester, N.B., was opened and machinery installed for the production of 1,000 tons of crushed ore per day. The surface of the mine was stripped and operations commenced.

A standard gauge railway was built to the junction of the Intercolonial at Black's Cut, and this was equipped with 50-ton steel ore cars and motive power to handle trains carrying 1,000 tons of ore each.

To provide shipping facilities, a dock was completed at Newcastle, N.B., with a storage capacity of 10,000 tons and machinery with a loading capacity of 3,000 tons per hour. This work was all done during the summer and completed in time to get out a first shipment of about 7,000 tons of ore before the close of navigation. This shipment went to the United States.

The mines owned by the corporation in Nova Scotia were also developed during the year, and mining and crushing machinery installed to take care of these at capacity of 800 tons per day.

Shipping docks for this ore were built at Port Wade, N.S., and equipped with loading facilities to handle 2,000 tons per hour. This work was also carried on during the year and completed in time to ship 20,000 tons of ore before the close of navigation, part of which ore was shipped to the United States and part to England and Scotland.

In the furnace department, the corporation completed the construction of a new blast furnace at Midland, Ont., having a capacity of 250 tons per day. This has been placed in successful operation.

In the foundries department, an entirely new and up-to-date plant was constructed at Three Rivers, Que., for the manufacturing of water pipe, this plant having a capacity of 75 tons of pipe per day and 25 tons of castings. This was successfully operated during the latter half of the year.

At Fort William, extensive additions and improvements were made to the plant, which had the effect of increasing the output of water pipe, castings, and car wheels. Here, also, the plant was successfully operated during the whole year.

The foundry plants at St. Thomas and Hamilton, Ont., and at Londonderry, N.S., were also in operation during the full period.

IN AND ABOUT STEWART, B.C.

(Written for the CANADIAN MINING JOURNAL, by W. W. RUSH.)

To those who have been interested in Portland Canal since the early days and have persistently urged its claims to recognition as an important mineral district, the activity of the past season has been particularly gratifying, although it has not equalled the expectations of the most sanguine. The camp now enjoys regular communication with Vancouver by several steamship lines. The mile long tide flat that has hitherto interposed a formidable barrier between Stewart and the outside world has been conquered and two wharves now reach out their long arms to greet the traveller and abate the exorbitant expense of handling ore and supplies that thus far has been a serious obstacle to the camp's development. A telegraph line is building toward Stewart. Prospecting has been more energetic than ever before and several important discoveries have been made, notably the "L. L. H." group on Bitter Creek, and the "Portland" on Salmon River. The transportation problem has been greatly simplified. Many miles have been added to the system of roads and trails, and bridges have been built on the main lines of transportation. The Portland Canal Short Line is well begun. Upwards of ten miles have been graded and rails are being laid. The road work and buildings are all of a substantial character. The familiar "toot" of the locomotive lends a cosmopolitan air to Stewart, and suggests manifold possibilities for the future.

The project of carrying the railway through to Edmonton, thus making Stewart the terminus of a transcontinental line, has been canvassed and appears both feasible and logical. As the most northerly port of British Columbia, Stewart is the natural outlet of a vast interior country stretching away to the Yukon, that in the course of years is certain to be exploited. Land

cruisers have been active all season along the line of the proposed route, and thousands of acres of agricultural land have been taken up in the Upper Naas Valley beyond the head of Bear River.

The money contributed to the various stock companies of the district during the excitement of last winter has been spent perhaps more economically than is usual in such circumstances. At any rate, in looking over the properties of the district one finds little trace of the extravagant or useless or premature equipments that in many camps stand as monuments to the incapacity of managers and the credulity of the investing public. With scarce an exception the new mining companies of the district have confined their operations to actual surface and underground development, and the necessary preliminary work of trails and camps. Office expenses are usually an insignificant item. Considering the amount of "dead work" necessary before actual mining could begin, the scarcity of labour, and the high operating costs incident to boom conditions, very fair progress has been made, and it is the writer's belief that in most instances the purchasers of mining stocks are having a fair run for their money.

Glacier Creek Trail

The pioneer operators of the district, the Portland Canal Mining Co., now under the management of W. J. Elmendorf, has been adding to its ore reserves throughout the year and now has in operation a complete and efficient concentrating plant of 50 tons daily capacity. Concentrates are being sacked for shipment. The Stewart Mining & Development Co. has confined its opera-

tions to underground work. At the Red Cliff some surfaee prospeeting has been done, but the most important work has been the driving of a working tunnel 300 feet below the upper workings. Like many other important eopper deposits, the Red Cliff ore bodies are irregular and have no semblanee to veins. There is nothing disclosed by the workings above the tunnel to prove the piteh of the ore body or to indieate that its vertieal extent is greater than its lateral extent. Therefore, if the lower tunnel has entered an ore body, as eurrent rumor reports, it may signify that the ore continues in a ehimney from the surfaee workings, or it may mean that an entirely distinet ore body has been struek. In view of the extensive mineralization of the vieinity, one eould reasonably expeet to find ore on other levels above and below the first workings.

Looking West from Lordygordy Camp

These older eompanies are still favourites on the stoek exehange, and by the general publie are looked upon as the most important properties of the distriet; but it is probable that some of the properties now in the initial stages of development will eventually dispute their pre-eminence and perhaps outrank them as ore producers. Some of the highest grade silver-lead ore in the distriet is being mined on the "Columbia" and "Evening Sun," situated on the Middle Fork of Glaeier Creek. The Lordygordy Mine, Ltd., operating these claims, reeently made a trial shipment of four tons that sampled $220 per ton, chiefly in silver. The Rush-Portland Mining Co., operating an adjoining property, has a trial shipment of similar grade saeked awaiting the completion of a horse trail for shipment. The "Exeelsior" group lying to the southward of the Lordygordy, has a splendid showing of the same elass of ore. The ore on these claims oeeurs in well-defined veins crossing the formation and dipping vertically or nearly so. Siderite is a eharacteristie gangue mineral. Negotiations are in progress for consolidating all the properties of this section.

Portland Canal Mill

On the South Fork side of the ridge the Paeific Exploration Co. is driving a series of erosseut tunnels on the Jumbo, situated 1½ miles southeast of the upper camp of the Portland Canal Mining Co. in the same vein zone. The lowest tunnel attains a vertieal depth of 750 feet below the surfaee workings. Manager H. E. Knobel reports that 5 feet of ore has been erosscut in the first tunnel and drifting is in progress. The hanging wall

has not been reached, the vein being at least 50 feet in width at this point. The ore is similar to that found on other properties of the same vein zone. On the "Mountain Boy," on American Creek, the same company is developing a series of east-west veins, or shear zones, carrying argentiferous lead, copper and zinc sulphides

bearing matrix on this group is described as a porphyry dike and the mineral an auriferous arsenopyrite. The "Old Chum," a contiguous property, has primary gold values in a well-defined quartz vein, with some copper. Available details regarding these two properties are meagre, but competent mining men are known to have

Red Cliff Camp

Bear River Valley

in a gangue of quartz, calcite and barite. The veins are from 10 to 25 feet wide, not sharply defined and rather limited in linear extent. There is a large amount of ore in sight, chiefly of concentrating grade.

Another new property that has the ear marks of a mine is the "L. L. H." on Bitter Creek. The mineral-

reported favourably on them, and the owners have declined a substantial offer from Henry Hoffman.

On Salmon River interest has centred in the section occupied by the "Big Missouri," "Martha Ellen," "Portland" and other claims of less note. In this vicinity the major part of the development work and

prospecting of the season has been done. H. B. Williams bears a very favourable report of the latter two properties, which he has examined in the interest of clients. On the "Portland No. 1" and "Portland No. 2," under

option to Clothier & Ritchie, a well-defined vein from 10 to 18 feet wide has been traced 1,800 feet along a contact between slate and granite. The strike is southeast, and the dip southwest about 70 degrees. The gangue is quartz and the mineralization consists of lead, zinc, copper and iron sulphides, carrying fair gold and silver values, elevation 2,200 feet. On the "Martha Ellen," one of the Salmon Glacier Mining Company's holdings, similar ore is found across widths of 5 to 30 feet, but the vein is not so well defined as the "Portland," elevation 3,500 feet.

The boom period has had its obvious advantages to the camp. Conservative interests would not have accomplished in a decade the amount of prospecting and dead work that has been done during the past season. The more conservative basis now attained also has its advantages, particularly in offering more favourable conditions to bona fide mining men, many of whom have doubtless held aloof hitherto on account of the high prices demanded for prospects and high operating costs. This problem of costs is as always a vital one. The excessive costs that characterized the beginning of the season have been abated considerably, but further progress in this direction is to be desired. The condition is to be met by the co-operation of the mine operators of the district and by consolidation of neighbouring properties into companies strong enough to conduct operations on an economical scale. With the natural advantages of the district in timber, water power, and proximity to tide water, costs of operating should be reduced to a very reasonable standard.

THE CONIAGAS MINES, LIMITED

(Abstract of Directors' Report.)

During the past year your mine has operated continuously, excepting holidays, with an average force of 133 men.

The capacity of the concentrating mill has been doubled by the addition of thirty stamps making a total of sixty stamps of 1,250 pounds each, crushing 160 to 170 tons of ore per day. The entire plant is now operated by electric power, purchased from the producing companies, as is also the compressed air for the mine. These extensions and improvements have resulted in a material saving in the cost of mining and concentrating per ton.

After extended tests in cyaniding of your ores, your Directors are satisfied that the method of concentration by water, followed in your mill, is more economical for your ore both in cost of treatment and in results, and that the tailings from your mill do not carry sufficient value to warrant further treatment at present.

The following was the quarterly output of the mine for the fiscal year:

	Concentrates.	Mine Ore.
1st Quarter	77,093.06 ozs.	155,660.47 ozs.
2nd Quarter	137,065.64 ozs.	184,680.74 ozs.
3rd Quarter	262,396.67 ozs.	184,284.72 ozs.
4th Quarter	473,345.98 ozs.	455,003.72 ozs.
Totals	949,901.35 ozs.	979,629.65 ozs.

Total concentrates and mined ore, 1,929,531.00 ozs.

From the financial statements, it will be seen that your company, after having paid out $240,000 in dividends during the past year, has a cash balance to its credit of $242,900.23, to which may be added ore in transit and at smelter, to a value estimated at $374,087.58.

During the year, the 225-foot level has been developed by winze sunk on Vein 6 D from the 150-foot level, and an upraise to connect up to Shaft No. 2.

The development on this 225-foot level is shown on accompanying plans. The character and value of the veins show no change.

No. 2 Vein has been followed on the 150-foot level and on the 225-foot level eastward, nearly to the boundary, carrying its usual size and value.

No. 6E Vein on the 225-foot level is about 2 1-2 inches in width of good ore (about 4,000 ounces) at the face, and the drift following it is extending the workings well towards the southeast unexplored portion of your area.

To the south of Veins Nos. 9 and 10, two valuable outcrops of good ore have been uncovered (marked Nos. 15 and 16 on Key of Veins) with an east and west strike, giving great promise of the value of this portion of your property, which will probably be reached during the coming year in the underground workings.

The progress of development and stoping during the year on the various veins is clearly shown on accompanying plans, from which it will be seen that the development has more than kept pace with the stoping, and shows an increase of over 2,500,000 ounces in the quantity of ore estimated as in sight, based on careful surveys and measurements made by Little & Baker, mining engineers, and certified by Mr. R. P. Rogers, C.E., assistant to the president.

Ore reserves in sight on October 31st, 1910, are estimated at 15,368,400 ounces of silver, contained in 127,167 tons of high grade ore and milling rock, as against 12,500,000 ounces estimated in sight on October 31st, 1909, contained in 106,000 tons of ore and milling rock.

These estimates are shown in more detail in the following table:

The average price received for silver for the past year was 53.55 cents, as compared with 50.18 cents for our last fiscal year, and with 52.3 cents for the previous year.

The relations between the management and employees have been, as usual, most satisfactory, and the general health has been excellent.

As in previous years, so last Christmas, your Directors presented each employee with a cheque for 4 per cent. of his wages during the year, amounting to $3,071.13.

During the year, John Redington resigned the position of superintendent, to take up consulting practice after over four years of faithful and satisfactory service in the employ of your company.

His duties as mine captain have been taken over by Arthur Martin, who has been in your company's service nearly five years.

Your Directors desire your approval of a by-law, No. 19, to permit a Director to act as superintendent or as assistant to the president.

The Coniagas Reduction Company, Limited.

The Coniagas Mines, Limited, owns the issued capital stock of the Coniagas Reduction Company, Limited, except six shares, issued to the Directors to qualify.

It is incorporated with Dominion Government charter.

Capital $250,000
Par value of shares 100

DIRECTORS:

R. W. Leonard, President, St. Catharines, Ont.
Dr. M. L. Hersey, Vice-President, Montreal, Que.
Alex, Longwell, Toronto, Ont.
F. J. Bishop, Brantford, Ont.
Welland D. Woodruff, St. Catharines, Ont.
R. L. Peek, Thorold, Ont.

The extensions and improvements to the plant, mentioned in Report for 1909, were completed during the year, and the plant is now doing excellent work.

Since your company started this plant, the price of white arsenic (of which cobalt ore, treated at its works, contains approximately 25 per cent.) has fallen from 7 cents to below 3 cents, and the price for cobalt (of which the ores, purchased at its works, carry from 2 to 12 per cent.), has fallen from $2.50 per pound for the oxide to almost a nominal price. Owing to these conditions, and the keen competition in the purchase of ore apart from the important advantage of handling the production of your own mine, the profits in this business are not what we anticipated. Under present tariff conditions, it is much more profitable to refine these raw products of the Cobalt mines in the United States.

During the fiscal year, the Coniagas Reduction Company treated 1,788.9 tons of ore, and shipped 2,726,-609.71 troy ounces of fine silver.

Year Ended October 31st, 1909.

The company has issued to the Coniagas Mines, Limited the 1,494 shares referred to in the last annual report of that company, and has reduced its floating debt by the amount of $64,000.00.

The Redington Rock Drill Company, Limited.

The Coniagas Mines, Limited, owns the controlling interest in the Redington Rock Drill Company, incorporated under a Dominion charter, with a capital of $100,000, in 1,000 shares of $100 each.

Your company is manufacturing these drills in its own shops at Cobalt, and fifteen of them are now working in your mine and giving excellent satisfaction in

every way.

A small force is constantly engaged in manufacturing these drills, and there is a good demand for them.

One drill has been under test for some months in competition with other types in an independent mine, and to date results have been very satisfactory.

R. W. LEONARD,
President and General Manager.

Mining in Coast Districts of British Columbia

The following notes give some information relative to mining in the Coast district of British Columbia last year:

Howe Sound.

Britannia Mining & Smelting Company.—This company continued exploratory work on its big copper property, near Howe Sound, during the greater part of last year. There was little new in connection with operations, though some ore of a different character to that usually found on one or other of the company's group was opened on its Bluff claim, and for several months the mill was run on this ore in an experimental way. A small tonnage of ore of the best grade was mined, and this, together with other ore mined in the course of development, and concentrate from the mill, was shipped to smelters. Altogether the year's output was a little more than 26,000 tons, and of this about 10,500 tons was smelted at the Tyee Copper Company's works at Ladysmith.

Vancouver Island.

Except coal mining, which was more active than ever before, there was no mining on a commercial basis on Vancouver Island in 1910. Some prospecting was done in the Alberni Canal district, also on the west coast of the island around Uchucklesat, and some fairly good showings of mineral were opened. A Victoria syndicate continued prospecting on some cinnabar claims near Sechart.

Tyee Copper Company.—The smelting operations of this company during 1910 resulted in regular increases in the tonnage of custom ore received and smelted. About 47,000 tons of ore and concentrates was received from all sources, British Columbia mines contributing 20,000 tons of that quantity. The marketable metallic contents of the ore smelted were: Copper, 4,500,000 pounds; gold, 5,300 ounces, and silver, 47,000 ounces. The plant at the company's smeltery was added to and further improved, making it thoroughly up-to-date in every respect. The prospects for the ensuing year are considered encouraging.

In view of the recent development of lead ore properties in the Coast district, the question of erecting a lead blast furnace is being considered; it has been decided that as soon as there shall be a sufficient tonnage of ore obtainable to warrant the expenditure, this addition to the company's smelting facilities will be made.

The company lately closed negotiations for a transfer of the leases of the Cornell group of gold-copper mines on Texada Island; it is expected that extensive development work will be done at this property in the near future.

Included in the Tyee Copper Company's activities last year was coal prospecting, in connection with which much exploratory work was done in the coal areas of the Gulf Islands—Galiano, Mayne, Saturna, etc. A diamond drill was kept in operation for several months, and in one instance a hole was bored to a depth of 1,000 feet.

Iron Ore on Vancouver Island.—Some time ago the Dominion Department of Mines published a report, by Mr. Einar Lindeman, on the iron ore deposits of Vancouver Island and vicinity, in which the more important occurrences of this mineral were described. Since then the discovery has been made, near upper Campbell Lake, of what has been described as giving promise of proving an immense deposit of magnetite ore of high-grade and purity. The discoverers are stated to have leased from the Esquimalt & Nanaimo Railway Company 1,290 acres on which this ore occurs. The iron is deposited along the contact of diorite and granite. It is stated that at one point, the soil having been stripped from the sidehill, there is shown a depth of iron deposit ranging to 70 feet. Analyses of the ore have given as high as 75 per cent. iron, but the average is about 65 per cent. It is claimed that the iron is exceptionally pure, an average sample analyzing: Sulphur, 0.04 per cent.; titanium, 0.08 per cent.; phosphorus, 0.0087 per cent. There is abundant water power obtainable from Campbell River Rapids, in the vicinity.

Coal Mining.—The total production of coal from Vancouver Island coal mines in 1910 was 1,616,000 long tons. No coke was made at Union last year. The largest producer of coal was the Canadian Collieries (Dunsmuir), Limited, with an output of about 926,000 tons. Next came the Western Fuel Company, which produced 512,000 tons. The Pacific Coast Coal Mines, Limited, made an output of 168,000 tons. The remainder of the production came from two or three small mines.

The market distribution of the Western Fuel Company's output was as follows: To British Columbia, 55 per cent.; to California, 28 per cent., and to other foreign parts, 17 per cent.

Early in 1910 the Pacific Coast Coal Mines, Limited, completed its railway from its South Wellington mine, to its shipping port, Boat Harbour, prior to which it was dependent on the E. & N. Railway for one mile of haul over its track. The Pacific Coast Company now owns seven and one-half miles of track, thirty 40-ton freight cars, and two locomotives. The company's highest output for a single day was 1,003 tons.

Texada Island.

Mining was fairly active during the greater part of last year on Texada Island; the largest producer was the Marble Bay mine, with the Northern Texada Mines, Limited, next. The latter company worked the Cornell and Copper Queen, under lease. A Seattle syndicate worked the Little Billy. The Northern Texada Company's mine and the Little Billy together shipped to the Tyee Copper Company's smeltery about 7,400 tons of ore of a gross value of $102,000. The Marble Bay's shipments totalled 10,380 tons. A new hoist and an electric light plant were put in, and three buildings—blacksmith, carpenter and machine shop—were erected; also new ore bunkers were completed.

Mining in Other Parts.

Among other parts of the Coast district at which mining was done last year were: Lasqueti, Valdes, Princess Royal, and Queen Charlotte Islands. There was little production made, though.

Mine Valuation and Experimental Metallurgical Demonstration

By R. B. LAMB.*

As mining and its associated art—metallurgy—have progressed under the influence of mechanical invention they have demanded the services of the technical engineer, and he has evolved a plan and advised exactitude.

The scientific training of the mining geologist, the mining engineer, and the metallurgical chemist has been directed towards mine valuation and probable metallurgical results; thereby enabling the valuing engineer to predict, with reasonable certainty, probable profits from the particular enterprise under investigation.

Owners do not yet fully appreciate the importance of the preliminary work of the scientific investigator, and are loth to spend money on an inquiry which to many appears unnecessary and wasteful.

Those who have engaged in the industry of mining for years and who have made it their life business, do not need to be persuaded that money spent intelligently on examination of ore bodies and investigation of mineral areas, is the most profitable expenditure made by the operator in the end—they know it.

The opinion of a farmer on a mine is about as valuable as that held by a Cardinal. The only opinion on a mine worth serious consideration, all others to the contrary notwithstanding, is that of the trained man who has devoted his time to the industry of mining. Primarily the man who has done this is the mining engineer. It matters not whether such a man be a graduate of a technical school or not. The one essential is that he has the experience and training that mark proficiency.

The work of mine valuation should be conducted with care and patience, without undue haste. It should never be the desire to have this work done cheaply—merely for the sake of a report. Work of such important nature takes time and requires checking if it is to mean anything. How often has a mining engineer been been required to report on insufficient data; how frequently has he been called upon to give conclusions on data collected by another; how many times has he rushed and harassed for his report; how often has he been requested to make a preliminary report pending his complete report—all on the plea of haste. This does an injustice to the engineer, to the mine, to the owners, to everybody.

Such reports are usually misleading. They do not represent the true facts, and they are a source of hard feeling and bitter regret.

The opinion of one engineer is usually not enough on any condition that presents mineral possibilities. It requires just as important investigation to turn a mine down as it does to recommend its purchase. Moreover, examinations on developing properties at long intervals are not sufficient; frequent examinations and investigations regularly made are necessary and should be undertaken if the highest results and best economic methods are to be obtained. Those interested in the ownership of properties are entitled to the benefit of such investigations and a moral obligation rests on the management to supply such information as the examinations disclose.

Mining is a quasi-public industry, and as such, the public is justified in demanding some measure of reliable publicity, such as can only be supplied by the engineer after due examination. Mining failures can be fully accounted for by followed advice tendered by the incompetent and the lay-man. The mining engineer—either the specialist or the general practitioner—has not steered the industry on the rocks. Despite so-called miners, experts, and others, whose business is to mine with paper models, the qualified engineer has turned the nose of the mining ship to the open sea and keeps it there. This has been largely attained by the intelligent work of the mine valuer.

Mine valuation has reached a high state of thoroughness in many countries. If we accept the best work carried on in many parts of Mexico, in South Africa, and notably in some of the Western States, such as Arizona, Montana, Colorado and Utah, as a guide—few disappointments will result.

The valuation of gold deposits presents most difficulty and requires the greatest care. The small weight of metal per given quantity of gangue matter and its irregular distribution in the ore-body are the principal factors rendering valuation of gold mines difficult.

Metallurgical inquiry is now the division of the industry enjoying a large share of the interest of the profession and occupying the spare moments of the investor. While the process-quack has enjoyed, and, to some extent continues to enjoy, the confidence of the mine owner, his occupation is passing with the metallurgists' ascendency. It was a slow and painful path over which the early metallurgical engineer plodded before partnership with his mining brother.

However, we now see the consulting engineer advising and demanding the employment of competent metallurgists to assist him and direct treatment problems. What is wanted, however, is more metallurgy. The miner should insist on time for metallurgical investigations as well as for mine examinations. He needs to demonstrate metallurgically—by laboratory and other methods—what can be accomplished with the treatment of the deposit under observation; how well it can be done, and at what probable cost. Metallurgical examinations are usually slower than mine examinations, and require scientific training, practical experience, and experimental demonstration applied to them before opinions of value can be expressed.

Mexico, South Africa, and Australia undoubtedly present the best instances of the progressive metallurgical spirit in gold and silver. They have continuously advanced practice by adopting new ideas—mechanical and chemical—which are themselves closely interwoven. During the past few years the United States has adapted and absorbed the progressive ideas evolved, and bids fair to outdo her rivals in the immediate future. Smelting successes have heretofore held back wet metallurgy north of the Rio Grande.

As the world progresses new demands are made. The coming demand from the prospective mining investor to the seller will be—more time for metallurgical demonstration.

*Mining Engineer, Traders Bank Building, Toronto, Ont.

CORRESPONDENCE.

December 29th, 1910.

The Editor, CANADIAN MINING JOURNAL, Toronto.

Sir,—In your issue of December 15th, you publish a friendly footnote in which you state that my report on the gold mines of Nova Scotia, made in 1905 for the government of that province, "was withheld from pub-

lication for the reason that it contained severe strictures upon certain operating companies."

Permit me to say that this statement is not correct. The fact that such an idea should be in the mind of one so well informed on Canadian affairs as yourself, is only another proof of the blunder made by the government in their failure to publish the report promptly. That delay was excused by reference to the San Francisco earthquake, to the incompleteness of the report, to the expectation of a supplementary report, and, in short, to a variety of reasons, all of which were imaginative, and intended simply to help the government out of an awkward position. I appreciated the humour of that position, but said nothing for three years, when, finally, a garbled version of my report was presented in a speech by the Prime Minister in Parliament; whereupon I wrote to you by way of protest. Since then I have seen references to the subject in the Proceedings of the Mining Society of Nova Scotia, in the course of which further inaccurate explanations and criticisms were offered, all with a view to discounting the opinion expressed by me in the interest of the Province of Nova Scotia, by whom I was paid to express such an opinion.

No more need be said, but I would ask you to use your influence to insist upon the publication of the report, and so end an absurd controversy. Those who read that report will need no further explanation from me.

Yours faithfully,

T. A. RICKARD.

Editor, CANADIAN MINING JOURNAL, Toronto, Ontario:

Sir,—You have several times requested me to write for the Journal, but as I could think of no subject of interest with which I am especially familiar, I have not done so.

In your issue of December 1st, in an editorial, entitled "Good Books," you say:—

"Bridge, auction bridge, poker, and other such devices of Satan, are as wasteful of time and energy in mining camps as elsewhere. Excessive card-playing is a misdirection of time, energy and money. It also softens the moral fibre."

As this is a subject wherein most men engaged in the mining business are interested, and since I have observed, during my long experience in a mining camp, the evils of poker playing, which I loath, it occurs to me that I might write my experiences, and give a few examples of what I have seen of the horrible evils of gambling, which, like the tentacles of an octopus, overcome the unfortunate victim and drag his soul to the depths of perdition. Even as the great Dr. Talmage inspected the gambling hells and dives of Leadville that he might warn Youth and Inexperience, which would naturally prefer his word to personal observation, so can I depict many scenes of ruin caused by the awful and degrading practice of gambling.

I could picture the horror and agony of soul when the uphappy one discovers that a straight flush beats four aces. I could describe the desperation of the unfortunate victim who has attempted to bluff when he held two deuces, and was called. I could describe the physical wrecks who have ruined their health by all night sessions of poker and stud.

With a pen, guided by sympathy and pity for human frailty, I could write volumes describing the human wreeks and derelicts I have seen.

If you care for any of this, I will contract for as many columns as you wish, for as long a time as you desire, at a stipulated price per word; guaranteeing that this price will not exceed that paid the mighty hunter, Roosevelt, for articles, the subjects of which are certainly not of as general interest as those upon which I propose to write.

Hoping to hear from you promptly as to the amount and price at which you are willing to contract. I am,

Youre truly,

FRANK C. LORING,

Home Life Building.

Toronto, Ont., Dec. 8, 1910.

BOOK REVIEWS

ELECTRIC CIRCUIT PROBLEMS—IN MINES AND FACTORIES, BY ELLIS H. CRAPPER, B. Eng., M.I.E.E., 169 PAGES. PRICE $1.00. PUBLISHED BY THE COLLIERY GUARDIAN CO, LIMITED, 30 and 31 FURNIVAL STREET, HOLBORN, LONDON, E.C. 1910.

To provide the mining engineer with an explanation of the principles, laws, and the methods of testing of the electric circuits of collieries, is the aim of this small book. A considerable amount of spaec has been given to the use and testing of cables. The book is written expressly to guide the colliery engineer. Sueh questions as insulation and circuit testing are amply discussed. The explanations are simple and easily understandable. The text is well illustrated with diagrams and half-tone engravings.

COMPRESSED AIR—THEORY AND COMPUTATIONS, BY ELMO G. HARRIS, C.E., 123 PAGES, PRICE, $1.50 NET. McGRAW-HILL BOOK COMPANY, 239 WEST 39TH STREET, NEW YORK, 1910.

This is a purely mathematical and theoretical treatise. The matter is original. It embraces brief expositions of formulae for work, effect of clearance, effect of heating air as it enters cylinders, work in compounding, and so on. Other general headings are: Measurement of Air, Friction in Air Pipes, Hydraulic and Centrifugal Air Compressors, Special Applications of Compressed Air, The Air-Lift Pump. Examples and exercises are appended, as also is a series of mathematical tables and friction diagrams.

Mr. Harris' book will be of use only to the technically trained. To such it will prove suggestive and helpful.

ELEMENTARY CRYSTALLOGRAPHY, BEING PART ONE OF GENERAL MINERALOGY, BY W. S. BAYLEY, PH.D., ASSOCIATE PROFESSOR OF MINERALOGY, UNIVERSITY OF ILLINOIS, 241 PAGES, COPIOUSLY ILLUSTRATED. PRICE —— NET. PUBLISHED BY McGRAW-HILL BOOK COMPANY, 239 WEST 39TH STREET, NEW YORK, 6 BOUVERIE STREET, LONDON, E.C. 1910.

Originally intended as an introduction to a textbook on mineralogy, the material that makes up "Elementary Crystallography" is now offered as an independent volume. The author has presented the subject in a manner that appeals to readers who have only a slight knowledge of mathematics, physics, and chemistry. The elements of crystallography, not the complete science, are outlined.

The Naumann System of parameter symbols is used instead of the more complicated Miller System of indices. This choice is wise. While the Miller system is essential to later study, the Naumann system is unquestionably the better suited to the beginner.

It is hardly necessary to add that the book is well printed and strongly bound. The names of the publishers imply this.

Those of us who struggled in our earlier days through Dana, will appreciate at its full value Dr. Bayley's conscientious effort to grade the road to a knowledge of crystallography.

INDUSTRIAL SECTION

A Western Installation

The Alberta Irrigation & Railway Company in 1908 carried out some large extensions to the plant at their No. 6 colliery, Lethbridge. Included in these was the installation of a twin Leonard Corliss engine to drive the ventilating fan.

During the past fifty years the world has made continued and unprecedented progress and the steam engine has not only kept pace with this advance but has also been one of the largest factors in stimulating it.

The distinguishing feature of the Leonard Corliss engine is its peculiar wrist plate motion and valve gear. By its use is secured such control and distribution of steam to the piston as has never been accomplished so successfully or so simply by any other means. This is best appreciated by those engineers who after trying

other schemes made it a study and learned what can be accomplished and gained by its use. With the wrist plate motion the valves are opened quickly, giving boiler pressure at closest cut off, and are kept in motion up to the point of extreme travel, permitting the cut off to be exactly determined and disengagements affected positively. Both the steam and exhaust valves are given a peculiar dwell movement where most needed.

The reversal of the valves is brought about without shock, the movement being easy from a state of rest to a rapid motion without straining the connections.

The Corliss valve has outlived the criticism of believers in flat siding surfaces who claimed that a boring bar and small engine to operate it were often required to true up Corliss valve seats. Corliss engines can be seen almost anywhere that have been in use for ten or twenty years without having valve seats rebored, and they are right and tight to-day. The Leonard Corliss valves are double parted, practically balanced and designed to take up their own wear. They can be quickly removed for examination and a separate and independent valve controls each part, so placed that a short passage leads, with the least amount of waste room, to the piston. The exhaust valves from their position drain the water from the cylinder and the steam valves are so constructed that they act as relief valves.

The general construction of these engines is shown in the accompanying cut, which also shows the massive pulley which drives the fan. The dash pots are located above the floor line, giving easy access. The plungers have no screws or nuts to work loose and cause trouble and every care is taken to ensure their prompt action. Thus the valves are closed instantly at the proper moment to produce the most economical results.

The governor is of the high speed variety having several revolutions to every one of the engine and thus giving very effective regulation. The speed is readily adjusted and the one governor is connected to the valve gear on both frames. The crosshead moves between bored guides, preserving both vertical and cross alignment. The shoes are adjusted by long solid wedges operated by compensating screws which can be locked in any position. The crosshead, if necessary, can be readily removed.

Some idea of the weight of the engine frames can be obtained from the cut and it will also readily be seen that the metal is so distributed as to give ample strength without undue weight.

The above mentioned engine is built by E. Leonard & Sons, the well-known engineering firm of London, Ont., and drives a large mine ventilating fan built by the American Blower Company, of Detroit. This fan is housed in separate room from the engine and the air is conducted in a concrete conduit from fan to mine. This conduit is entirely separate from the working shaft of the mine. The whole installation is one of much interest and will doubtless open the eyes of a good many as to the vast scale in which coal mining operations are carried on in the Crow's Nest district and vicinity.

Belliss and Morcom

Messrs. Belliss & Morcom, engineers, of Birmingham, who have within the last few years introduced a steam turbine of their own design, report very successful progress with it in every respect. Within the last few weeks they have secured an important order from the Birmingham Corporation electricity supply department for eight 1,000 k.w. Belliss exhaust steam turbines, running at 1,500 r.p.m., to work in conjunction with a similar number of Belliss 1,500 k.w. reciprocating engines in the Summer Lane Station, Birmingham. These exhaust turbines will run in parallel with the alternating current reciprocating sets in the station, making the total capacity of each set 2,500 k.w., and bringing the ultimate total capacity of the station, comprising Belliss engines and turbines exclusively, to over 30,000 k.w. Repeat orders have also been received for Belliss high pressure steam turbines. The first Belliss high pressure turbine built to a customer's order was for

the Aston Manor Corporation, and gave such satisfaction that a repeat order was placed.

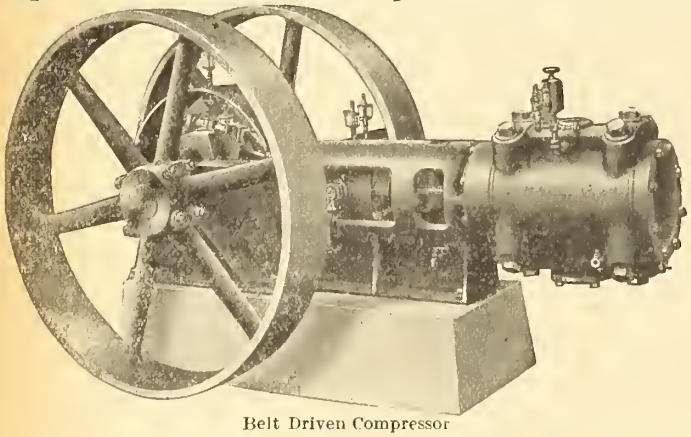
Quite recently the city of Johannesburg in South Africa, placed a repeat order for a Belliss live steam turbine of 3,000 k.w. capacity.

Messrs. Laurie & Lamb, Board of Trade Building, Montreal, are Canadian agents for this firm.

Small Air Compressors for Heavy Duty

The accompanying illustrations show the new single steam and power driven Sullivan air compressors, classes WA-4 and WG-4, which have recently been placed upon the market.

These compressors have been designed especially for the severe service imposed on machinery of this class by mining work. Air power service demands, above all else, continuous and reliable performance. Troubles with the compressor mean idle tools and idle men, causing waste which soon evens up the difference in the



Belt Driven Compressor

purchase price between a good air compressor and a poor one. The air compressors we describe are of small to moderate capacity and are built for various pressures running from 10 to 100 pounds per square inch.

The manufacturers have realized that compressors of this size inevitably receive less careful attention than larger and more costly machines, while the work demanded of them is no less continuous and wearing.

An examination of these machines will further show that the makers have had two objects in view: to produce an air compressor as simple and as durable as possible, and one in which the elements constituting efficiency should be embodied to the greatest possible extent.

These compressors consist of a heavy frame, supporting the bearings and crank shaft at one end and the steam and air cylinders at the other. The machines are of the centre crank type, and a heavy steel guard surrounds the crank and prevents oil from being thrown upon the floor.

In the steam-driven machines, the plain steam slide valve is controlled by an eccentric on the shaft, with which it is connected by a simple but satisfactory arrangement of valve rods. The air cylinder is placed outside the steam cylinder, and is connected to it by a heavy distance piece. The air cylinder is supported on a sub-base which runs the entire length of the compressor, and maintains proper alignment of all the parts.

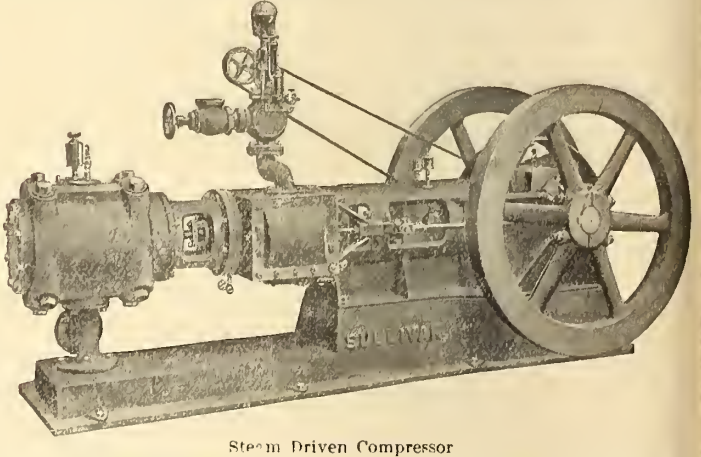
In the belt-driven machines, the air cylinder is attached directly to the rear end of the frame, and all the working parts, such as the crank shaft, cross head, connecting rods and main bearings are of dimensions and contain an amount and quality of material which provide a factor of safety very much higher than is considered necessary in standard compressors of much larger size. The result is that these machines may be depended upon for continuous service year in and year out, and that the danger of breakage from causes within the compressor is reduced to its lowest terms. All parts liable to wear are arranged so that wear may be taken up fully and with the least possible trouble, so that even after these machines have been in service for years, all their working parts remain accurately aligned and in condition to operate with practically their original efficiency.

Particular attention is directed to the design of the cylinder, the inlet valves being at the bottom and the cylinder heads are also jacketed over their whole surface.

This feature keeps the heat generated by compression within safe limits. The air valve mechanism consists of radial automatic poppet valves for both inlet and discharge.

These valves are placed close to the ends of the cylinder, the inlet valves being at the bottom and the discharge valves at the top of the cylinder. The valves act in a true radial direction to the axis of the cylinder, and reduce to a minimum the losses in efficiency made necessary by clearance.

The ports or pockets leading to the valves are very short and direct, so that practically no air is trapped after compression instead of being expelled from the cylinder. The valves and their parts are so made that in case of breakage it is impossible for the broken pieces to enter the bore of the cylinder. The valves are held in place in cages, which seat, by means of taper fits, in the cylinder walls. To remove these valves it is only necessary to unscrew the plug on the outside of the cylinder, when the entire valve and cage may be withdrawn for inspection or regrinding. The main bearings have adjustable caps and are heavily lined with a good grade of Babbitt metal. They are bored



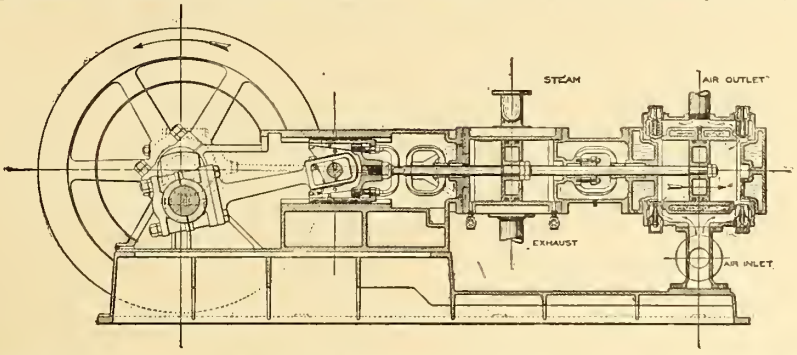
Steam Driven Compressor

out at right angles to the centre line of the piston rod by a special fixture which assures accurate alignment. A box pattern cross-head is used, being the same type as that employed in cross compound machines of the highest grade. It is fitted with adjustable shoes and is regarded as unexcelled in wearing qualities and ease of adjustment.

The steam machines are governed by a split ball throttling regulator with an extra cylinder which places the throttle valve under the influence of the air receiver pressure. Ordinarily, the governor varies the speed of the compressor to supply the demand for air, the halves of the ball by their centrifugal action pre-

venting the compressor from exceeding a safe speed.

The power-driven machines are fitted when desired with an unloading device placed on the air inlet of the compressor. This device is set to shut off the incoming air to the compressor when the receiver pressure exceeds a pre-determined point. This enables the compressor to run at regular speed, an essential in power-driven machines, compressing no air until the receiver pressure again falls below the point set. This secures important reductions in the amount of power used when the compressor is furnishing air intermittently. The device is smooth and even in its action, throwing the load off and on the compressor without sudden jar or strain.



The machines described are fitted with sight feed oil cups on important bearings and on the air cylinder. They are so simple in their mechanism as to require only the most ordinary care, but as stated above are made of the very best materials which can be secured for the respective purposes of each part and they are manufactured and assembled with the same care employed on the largest and most expensive machines manufactured.

Machines of similar capacity are furnished for operation by electric motor, or gasoline engine, as desired.

Personal and General

The respected Dean of the Canadian Mining Institute, Major R. G. Leckie, is to be felicitated upon the arrival of a small daughter.

Mr. G. G. S. Lindsey left for England on January 6th. He will return to Toronto before the end of February.

Mr. Phil. H. Moore, E.M., has been appointed Canadian representative of the McKiernan-Terry Drill Company, 115 Broadway, New York. Mr. Moore has made the King Edward Hotel, Toronto, his temporary headquarters.

Mr. C. S. Herzig has removed his office to 42 Broadway, New York.

Mr. F. H. Sexton, director of technical education for Nova Scotia, is to accompany the Technical Education Commission on its visit to Europe.

Mr. Joseph C. Houston, late of the Right of Way, Cobalt, is at present at 163 Westminster Avenue, Toronto. Mr. Houston is one of the pioneers of Cobalt. He has lately returned from Mexico.

Mr. W. J. Woolsey, manager the Robertson Asbestos Mining Company, Thetford Mines, is absent on a business trip through Great Britain, the Continent, and the United States. He will not return until late in February.

Mr. E. T. Corkill has returned from the West, accompanied by Mrs. Corkill.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

Glace Bay.—The output of the Dominion Coal Company's collieries for 1910 was 3,529,700 tons. Compared with previous years the figures are as follows:—

1907	3,541,253
1908	3,555,068
1909	2,734,774
1910	3,529,700

The outputs of the individual collieries were as under:—

No. 1	578,942
No. 2	687,918
No. 3	277,027
No. 4	395,346
No. 5	364,926
No. 6	181,331
No. 7	180,466
No. 8	156,590
No. 9	327,353
No. 10	160,271
No. 12	162,429
No. 14	47,664
No. 15	9,037
	3,529,700

The output at No. 1 Colliery was the largest since the fire in 1903. The output of No. 7 (Hub Colliery) was the largest ever obtained from that mine. It will be noticed that about 220,000 tons of the total output was obtained from mines Nos. 12, 14, and 15, which are situated in the new coal field at Lingan. At some of the older mines, notably Nos. 3, 5, and 8, the output shows a considerable falling off and will continue to do so, but the consequent reduction in output will be more than made up by the contribution from the newer mines.

The U. M. W. strike was called off at the end of April, and the loss in output due to the strike amounted to probably 300,000 tons. Had conditions been normal, the yearly output would easily have reached 3,800,000 tons. If the demand for coal continues to be good and trade conditions continue to be as prosperous as at present, the output for 1911 should be somewhere between 3,750,000 and 4,000,000 tons.

Explosion at Sydney Mines No. 3.—An explosion occurred on January 3rd about four o'clock in the morning in the No. 3 Colliery of the Nova Scotia Steel and Coal Company at Sydney Mines, which caused the death of eight men. At the time of writing only six bodies have been recovered, but there can be no doubt but that the two men who are still missing were killed by the explosion. The explosion was a very severe one and completely wrecked the main deep below No. 12 level.

The severity of the detonation may be gauged from the fact that a small hoisting engine which was near the end of No. 12 level was lifted bodily from its bed and displaced a distance of over twenty feet. At the time of writing the men occupied on repair work had penetrated as far as the sixth cross-cut on No. 12 level, but their progress is very much hampered by extensive falls of roof. The bodies of six shiftmen were found all together under the debris on the deep near the end of No. 12 level. It is thought that the bodies of the two deputies who are missing will be found in No. 14 level. Until the exploration has been completed and the two missing men have been found, the cause of the explosion cannot be ascertained. The mine had been idle on the Sunday and Monday previous to the explosion on account of the New Year holiday, and it is thought that gas may have accumulated and been ignited by a defective safety lamp, but until the workings have been thoroughly explored and an investigation has been held the cause of the disaster can only be a matter of surmise. The workings of No. 3 Colliery are entirely submarine and safety lamps only are used.

The Nova Scotia Company has twelve Draeger helmets and the first parties to descend the mine after the explosion used these for exploration purposes before the ventilation was restored. The extensive falls which blocked the deep rendered it impossible to do any rescue work, and nothing could be accomplished until the ventilation had been restored up to the point where the falls occurred. This was speedily done and every effort was made to discover the missing men, there being a faint hope that they might be found alive behind the falls. This hope was speedily dissipated by the finding of the six dead bodies as related above. It is extremely fortunate that the explosion did not occur at a later hour, as had this been the case the loss of life must have been severe. The usual day shift numbers five hundred men.

The explosion appears to have been very local in its character, but from all accounts it was one of the severest which has yet been experienced in Cape Breton coal mines. It has been for many years a matter for congratulation that Cape Breton coal mines have been free of the disastrous explosions which have characterized other coal fields, but this incident is a significant reminder that this fortunate immunity should not be presumed upon.

ONTARIO.

Cobalt.—The Green Mechan and Red Rock properties are being worked again by Mr. A. M. Thomson on a royalty basis. Twelve men are at work and operations have commenced at the 100-foot level. A royalty of ten per cent. is to be paid on ten-ounce ore, 50 ounces, 17½ per cent., and all over 50 ounces, 25 per cent. In the event of royalties going over $50,000 Mr. Thomson has the option of another five-year lease.

The Gould Consolidated lease on Cart Lake is to be worked again. It is stated that $10,000 is already on hand to work the property and that $30,000 will be spent in operations this winter. A capable engineer will be engaged to superintend the work.

On the last day of the old year the shipments totalled 418.96 tons and 13 cars left the yards. The shipments were made from the Nipissing, McKinley-Darragh, Cobalt Lake, Coniagas, Temiskaming, Crown Reserve, La Rose, and Trethewey.

A new vein of calcite carrying some smaltite and native silver has been cut on A90 of Gillies Limit or the Webb property. Considerable work is being carried on at this claim.

The Nipissing mines and La Rose Consolidated have yielded net profits for the year of $3,400,000. The Nipissing contributed to the total $2,228, 092 and La Rose $1,138,240.

The quarterly report of the City of Cobalt ended December 31st, shows a gain of $17,000. At the end of September the balance was $11,870, at the end of December, $28,525.21. Returns from smelters amounted to $51,850.74, while ore at smelters is estimated at $19,000.

Some of the most remarkable ore ever seen in Cobalt camp is now being mined at the Lawson. No. 8 vein, at the 200-foot level, has two ore shoots, one 25 feet long, the other 21 feet. The average width of these shoots is eight inches and values will go over 5,000 ounces. In places the vein is a foot wide of 12,000-ounce ore. Another good vein has also been cut along the Foster line. It is about two inches wide, shows up well for forty feet and there are occasional patches of high grade.

The Hudson Bay Company has cut another rich stringer at the 200-foot level. This is the fourth new vein discovered this fall. The new mill should be running by the end of this month or the beginning of next.

The sale of the Standard Cobalt mine, fixed for December 28th, was postponed and attempts are now being made to declare the company solvent. It is understood that a prominent New York engineer has been offered the post of consulting engineer and that the mine is likely to resume work on a legitimate mining basis.

The annual report of the McKinley-Darragh, which will be published at the end of this month, will contain a statement by Mr. P. A. Robbins, the retiring general manager, that there are three years' ore reserves in sight at the McKinley-Darragh alone. The cost per ounce of silver has not been reduced. The production will be in the neighbourhood of 1,700,000 ounces. The average tonnage milled is now 127.25, and, while the mill heads are running about the same as at the beginning of the year, the tails have been cut down from 7.24 to 5.80 ounces.

From a cross-cut, 510 feet below the top of the cliff, the King Edward has cut one of its veins. It contains some smaltite, but does not show up very well so far.

The mill report for November for the Buffalo mines reads: Mill ran 591 hours; ore milled, 3,417 tons; average assay per ton before milling, 32.03; ounces of silver recovered, 87,266 ounces; ounces silver shipped, 117,099.07 ounces.

The Empire Cobalt Mines has issued a statement to the effect that work will be resumed. Treasury stock is to be sold to defray the cost of development.

The production of the Buffalo for the first six months of the old year was 850,000 ounces, against 700,000 ounces for the same period of 1909. Development on the 300-foot level continues most satisfactory. No. 19 vein frequently shows nine inches of high-grade smaltite ore in the nine feet of milling rock.

The Hargrave has picked up the Kerr Lake No. 3 vein within its own territory. Two short but very rich ore shoots have already been passed through and driving on the vein still continues. Good values are being obtained by the Drummond on the extension of the No. 1 vein of the Hargrave.

Several discoveries of importance have been made on the Beaver mine within the past month. On the 250-foot level some distance from the main workings two or three inches of high-grade have been cut in a vein which on the surface showed nothing but cobalt and bloom. On the 300-foot level two shoots of high-grade ore have been driven through and good ore is being stoped out. A high-grade car will be shipped early in the new year.

The Coniagas annual statement shows a surplus of almost a million dollars and an increase of 3,000,000 ounces estimated ore in sight. The cost of production was lower by 13.28 cents per ounce. The total revenue was $1,010,000, and net profit, $753,888.

Porcupine.—The Vipond stamp mill is now in operation. About ten tons of hand-picked ore was all ready for the time when the mill should commence to operate, and it is expected that the Porcupine gold mines will be able to show results soon.

The Healey group of eight claims in southeast Deloro, the Ritchie four claims and the two Mancha claims have been taken over by a syndicate of Haileybury and Kentucky men.

Mr. A. J. Young, of North Bay, and Cyril T. Young, of Haileybury, have purchased two claims of W. S. Edwards for $10,000 cash. The claims lie near the Dobie claims in Tisdale on the edge of the Reserve.

The Hudson Bay, the Trethewey, and several other strong Cobalt interests are developing claims in the Redstone River section. A small settlement is starting up and a store and stopping place are being built.

Several finds of visible gold have been made on the Martin claims lying east of Simpson Lake and north of the Preston and Brydge properties. The claim is owned by S. A. Powers, L. G. Mayhew and C. T. Young, all of Haileybury.

There are now no less than seven townsites located round or in the vicinity of Porcupine Lake. There is a lively trade in real estate and the announcement of the route of the new Porcupine railroad is awaited with the greatest interest.

The Scottish Ontario, the first property to start operations in the Porcupine camp, has cut its vein at the hundred-foot level. At a depth of 47 feet, the vein dipped out of the shaft and was cut in a forty-foot long cross-cut. While the quartz shows no free gold it pans well.

Two shafts are being sunk on the Armstrong McGibbon property with the object of discovering, as soon as possible, how the ore runs below. Thirty-five men are at work and Mr. C. E. Watson is installing his small plant. The most spectacular portion of the find has been housed in to prevent high-grading.

To operate the old telephone lines from Matheson to Porcupine a company has been formed capitalized at $40,000. Communication has been reopened and it is stated that good business is being done.

A daily mail delivery in Porcupine has now commenced. It is better than the bi-weekly distribution, but the service is very poor yet.

Failure to do settlement duty on the Richard Mulchany veteran claim in Tisdale has led to the forfeiture to the Government of that valuable property. The lot adjoins Lake Simpson and is valuable on its location alone. It is thought that the Government may intend to lay out a townsite on Lake Simpson.

There is now a very lively interest in Thomas Township and good finds are reported. The dykes are wide and the values from $2 to $5.60, though low, are very uniform.

Mine owners are already commencing to take precautions against high grading. All gold showings in the Dome are plastered with black paint, so that any high-grading can be at once detected. On the Tisdale property the big lead will be housed in. Mr. Timmins has made the proposal that all mine owners should insist on all miners changing their clothes when they come up from below.

The Quebec Government has issued a report stating that free gold and sylvanite have been discovered in quartz bodies on Lakes Fortune and Renault, near the north end of Opasatika Lake, 45 miles from Haileybury. Mr. Robert Harvie, who made the examination, stated that but one specimen was discovered with visible gold, but it was quite representative. The gold occurs in combination with the sylvanite. Several properties have been working in this section of Northern Quebec for some time. The Porcupine Exploration and Mines Company has taken an option on three Deloro claims and has added them to the Herleahy-McPharland group it is already working.

A considerable amount of machinery is going into Munro Township. The Detroit syndicate is taking in two small boilers and a compressor, and the Gold Pyramid Mining Company a small mill.

The Porcupine trail is crowded after the New Year holidays, Fifty stages are running and they are crowded all the time.

The report of the quarantine of Porcupine has not foundation in fact. A suspect case found in a local restaurant has been isolated and an isolation hospital has been established.

Gowganda and Elk Lake.—The road into Gowganda is now in excellent shape. The road has been considerably shortened and it can now be made from Charlton in nine hours.

Sixty teams were, at the beginning of the month, on the trail taking in machinery.

The Hudson Bay Company, on its property at South Hangingstone Lake, is sinking three shafts on three promising veins. A boiler and compressor plant will be installed with all speed. Three tons of 3,000-ounce ore have already been bagged.

The machine shop at the Bartlett mines has been destroyed and the engine room damaged by a fire that broke out there last month. The management states that the machinery was only slightly damaged, and the net loss will only be $1,500. Mining operations will proceed as usual.

The Millerett has shipped two more cars of ore and the Miller Lake O'Brien has one on the road. Over 500 tons have now been despatched from the Gowganda camp.

The La Brick property will resume operations early this month. The La Brick belongs to the interests controlling the King Edward mines at Cobalt.

At Elk Lake it is reported that the Silver Alliance, Toledo and United States Silver Mining Company, all holding properties near the line of James and Tudhope, will resume operations this year.

Kenora.—The Kenora mining division and the adjacent lands in Manitoba between Ingolf and Rennie, round West Hawk Lake and Star Lake, are at present giving rise to speculation and rumour as to the probability of a second boom there.

The Mikado mine is being operated by the Kenora Mines, Limited, and the management is so much to the liking of the present shareholders that all treasury stock has been withdrawn from sale, and, although the mine has only been in operation under the present company for three months, and they have not at present got a cyanide plant, gold bullion to the amount of $3,911 has already been sent into the bank here, while Mr. Nickerson, the manager, reports that without the cyanide plant he can only extract 25 per cent. of the gold, and advises shutting down the mill and proceeding with development work only until the spring, when the new cyanide plant is to be installed.

This course will, undoubtedly, be followed, since a large sum has just been paid to the English syndicate formerly owning the mine, showing the Kenora Mines, Limited, shareholders to be amply satisfied with the showing of the mine and to have the utmost confidence in the outcome of purchasing and operating this mine.

Mr. Nickerson reports the presence of bismuth, molybdenite, arsenic, copper and iron pyrites in the ore, a splendid body of which has been located on the 7th level, 16 feet wide and extending upwards almost vertically to the 4th level, besides showing signs of strengthening as the depth increases.

On the hanging wall there is a streak of rich ore between 18 inches and 2 feet wide, giving values between $50 and $75 per ton, while the rest of the lode averages between $5 and $6, giving an average value for this immense body of ore of $20 per ton.

Locations K47 and K49 in Clear Water Bay, Lake of the Woods, are now under development and showing some good values. The main shaft is down about 50 feet, and the vein strengthening.

Oscar Cronlund is developing what promises to be a splendid property on Hell Diver Bay, Shoal Lake, not far from the Mikado. While development work only is being done here, there is enough free gold to make one expect interesting results from these claims.

Another property, "The Ophir," which formerly produced some of the richest specimens from this country, but which had to be closed down on account of litigation, has again been started up and a gang is now at work sinking. Great things are expected from this mine and rightly so from the richness

of lode right on the surface. There are some test pits and a 20-foot shaft already sunk and the work now going forward will open the property up and give the owners a chance to gauge the real value of the mine.

A new company is being formed to be known as "The Eagle Lake Consolidated Mines, Limited," to operate properties on Eagle Lake, which is partially developed and so far has shown itself to be well worth investigation. Mr. Newton Higbee is managing director, and was the original owner, and associated with him is Mr. Harding Rideout, of Kenora.

BRITISH COLUMBIA.

Cariboo.—Operations at Mr. John Hopp's Lowhee placer mine in 1910 were on a much larger scale than in earlier years. About 200,000 cubic yards of gravel was moved, as compared with 60,000 yards in 1909. More improvements were made, ditches having been extended, reservoirs constructed, and more plant put in. On the Mucho Oro property water was so short last fall that the quantity of gravel moved was much less than in ordinary seasons. The Forest Rose mine, also, suffered from a shortage of water, so the amount of gold recovered was smaller. At Mosquito Creek, the Alabama and Williams hydraulic mines were worked with fairly good results, 50,000 yards of gravel having been moved, notwithstanding unfavourable water conditions.

The hydraulic mines on China Creek and Nugget gulch are reported to have had a fair run for the season. The Waverley Hydraulic Company made a bedrock cut through a rim into another channel and opened ground that promises good results.

Other hydraulic properties worked were the old South Wales, near Van Winkle; H. H. Jones' property on Last Chance Creek, and several more in different parts of the district.

The Lightning Creek Gold Gravels and Drainage Company has been sinking a shaft at Wingdam, and is reported to be nearing ground from which rich prospects have been obtained.

Atlin.—The estimated amount of placer gold recovered in Atlin district in 1910 was $260,000, which is larger than in either 1909 or 1908. McKee, Pine and Spruce Creeks are the larger producers, the yield of other creeks not being nearly as much. The operations of the North Columbia Gold Mining Company are stated to have been successful, that company having had the benefit of an abundant water supply. Quartz mining received a little more attention last year than previously, and in several cases with promising results.

East Kootenay.—Last year's production at the St. Eugene mine totalled 77,500 tons of ore, practically the whole of which was put through the concentrating mill, the product having been about 12,600 tons of lead concentrate, which was shipped to the Consolidated Company's smeltery at Trail. This production compares unfavourably with that of 1909, in which year there was about 150,000 tons of ore mined and shipments to the smeltery totalled nearly 22,000 tons.

From the Sullivan group, which was not a producer in 1909, between 24,000 and 25,000 tons of ore was taken and sent to the smeltery. This ore contained about 172,000 oz. of silver and 8,494,000 lbs. of lead. Operations were commenced in December, 1909, and the first shipment of ore under the Consolidated Company's lease was sent out about January 1. Since then a skip hoist for hoisting coal from the railway track to the top of the lower terminal of the aerial tramway has been put in. A bin to hold 100 tons of coal was built at the mine, and a 200-ton ore storage bunker at the lower terminal of the tramway. At the mine, electric lights were provided for the surface plant. A skip in the shaft, a belt conveyor for hand-sorting ore, and a rake, attached to a double-drum hoist for moving the ore in raises or stopes where the footwall is too flat for the ore to run by gravity, were added to the mine plant.

Ainsworth.—Prior to the fire which, last summer, destroyed the Whitewater concentrating mill and so damaged the Kaslo & Slocan railway as to prevent trains being run to Whitewater, the following shipments were made: Whitewater mine, crude ore 184 tons, silver-lead concentrate 47 tons, zinc concentrate 290 tons; Whitewater Deep mine, crude ore 275 tons, silver-lead concentrate 357 tons, zinc concentrate 2,052 tons. The total metal contents of all the before-mentioned shipments were: Gold 75 oz., silver 104,583 oz., lead 642,028 lbs., zinc 1,920,078 lbs. The Whitewater lease was abandoned by the lessees after the destruction of the mill, and the Whitewater property(outcrop) reverted to the English company owning it (The Whitewater Mines, Ltd.). The "deep" of the Whitewater vein was developed up to the time of the fire, and development is being continued throughout the winter by The Deep Mine, Ltd. Since the fire the latter company has been engaged in making necessary repairs to power plant and equipment, this involving the construction of practically new equipment. Further development is being done this winter below the "outcrop" property by J. L. Retallack & Co. In the property controlled by this firm, about 400 feet of development tunnels and raises was driven prior to the fire. The Deep Mine, Ltd., also did some 300 feet of development about the same time, but when the vein was cut by this company, the rush of water drove the miners out and prevented work from being continued.

Slocan.—Work done in 1910 on the Panama, which is situated high up on the mountain above Bear Lake, was about 500 feet and 75 tons of high-grade ore was mined. Of this, 55 tons was shipped to Trail; its average silver content was 200 oz. per ton. Snow having fallen in sufficient quantity to make the hauling good, ore is being hauled from the Rambler-Cariboo mine to the Canadian Pacific Railway at Three Forks. More than 350 tons had been hauled half-way before the snow came. It is expected that while the road shall continue good enough for hauling to be continued, the output will be fully 200 tons a month. There is much ore available, shoots having been opened on several levels down to the 1,050-foot. The further development of the Washington mine was continued during the greater part of last year. The total footage of work done was more than 1,300 feet. No ore has been shipped from this property for some time, but the mine is being prepared to make a large production later.

No other mine in the Slocan has attracted so much attention during recent months as the Standard, a description of which was published lately in the Canadian Mining Journal. The sensational accounts sent out last month from Spokane, Washington, to the effect that a 65/100th interest in the Standard group had been sold on a basis of $2,500,000 for the whole, it has since transpired were quite unwarranted. The truth is that an option has been taken on a controlling interest, probably that mentioned, but the statement that a large sum of money has been paid is at variance with the facts. There is reason to believe that the Spokane syndicate that has obtained the right to purchase control will work more men on the property so as to develop it more quickly and so enable them to sooner determine more concerning the big shoot of ore that has been opened on No. 5 level.

Rossland.—A brief summary of the results of mining in Rossland camp to the end of 1910 gives the following information: The records of production of Rossland mines to the end of 1909 show a gross tonnage of 3,318,007 tons of ore, valued at $46,352,947, or nearly $14 per ton general average value. If the production of 1910 be added, an aggregate tonnage of more than 3,500,000 tons, and a gross value of approximately $50,000,000, will be the result. Of this large quantity, the production of the Le Roi mine totals about 1,550,000 tons, value $20,600,000, and that of the Centre Star-War Eagle group, a rather larger tonnage and higher value. Then the mines of the Le Roi No. 2, Ltd., have produced, roughly 300,000 tons of ore, of a total value of $6,000,000, or more. The Jumbo, Rossland-Koo-

tenay, Rossland-Great Western, Velvet-Portland, Spitzee, White Bear, Giant, I.X.L., Evening Star, and others, together contributed the remainder of the aggregate production shown above. Notwithstanding the decision to wind up the Le Roi Mining Company, Rossland is still an important mining camp, and there is good reason to think it will long continue to be productive, for several of its mines are known to still have large reserves of ore.

Lardeau.—The Ferguson Mines, Ltd., in 1910, did about 1,600 linear feet of development work and mined between 800 and 900 tons of ore of shipping grade. The winze from the lower Sunshine tunnel of the company's Silver Cup mine entered the ore, while drifts from it also opened ore shoots. A commencement has been made to ship ore from the Beatrice mine, situated in the vicinity of Camborne, Fish River.

Boundary.—The total tonnage of ore from the mines of the Boundary district for the year 1910 was about 1,680,000 tons. In round figures the proportions of the respective mining companies were as follows: Granby Co., 1,100,000; British Columbia Copper Co., 383,000 tons; Consolidated M. & S. Co., 143,000 tons; New Dominion Copper Co., 54,000 tons. With the exception of that produced from the mines of the Consolidated Co., this large quantity of ore was smelted at the works of the Granby and British Columbia Copper companies.

Similkameen.—Mr. Chas. F. Law, of Vancouver, who lately returned from England, is arranging for commencing work on the property of the British Columbia Platinum Company, situated at the mouth of Slate Creek, near the confluence of that stream with the Tulameen River. Mr. Law has succeeded in interesting in this enterprise, Messrs. Johnston & Matthey, the well-known, old-established firm of platinum refiners, of London, England. The platinum-bearing gravels will be prospected with a Keystone drill. Slate Creek is stated to be the most highly auriferous and platinum-bearing stream in the district. The expectation is that an important platinum-producing property will be developed here and that British Columbia will hereafter supply an appreciable amount of platinum to the market, which is now largely dependent upon Russia for this mineral.

Princess Royal Island.—During 1910, Mr. A. B. Clabon and associates acquired nine mineral claims, known as the D.L.S. group, situated at or near Surf Inlet, Princess Royal Island. Two parallel veins had previously been opened on the Bluff claim of the group, chiefly by adits and a shaft. The adit on the upper, or west, vein was driven 140 feet, while the length of that on the lower, or east vein, was in 293 feet. The shaft was commenced at an elevation of about 265 feet above the lower tunnel and was sunk 60 feet, which leaves a distance of 205 feet between the bottom of the shaft and the lower adit. The difference in elevation between the two adits is about 100 course through the group. The usual outcrop is given as being feet. The veins are stated to run more than 6,000 feet on their 18 inches to 4 feet, but where opened shows a width of 6 to 12 feet. The ore is quartz, with iron pyrites containing gold and a small quantity of silver. A list of assay results from 40 samples shows value varying from $1 up to $207.20 per ton, the average of the lot being nearly $40 per ton, though only 15 of the 40 gave a return of $20 or over. The ore is regarded as of a character better adapted to concentration than to stamp-milling for the recovery of its valuable contents. The development done in 1910 was not considerable, but it served to show that where cross-cut in the lower adit, at nearly 200 feet from its portal, the vein is 16 feet in width and assays of average samples yielded a value in gold of $15 per ton. A winze sunk 20 feet in the vein from the floor of this cross-cut showed the occurrence of similar ore.

MINING NEWS OF THE WORLD.

UNITED STATES.

New York City.—At a meeting of the Tisdale Mining Company, Frank C. Armstrong, of New York, was elected president, E. P. Earle, president of the Nipissing Mines Company, vice-president, and D. Lorne McGibbon of Montreal and Samuel J. Dobie of Haileybury, directors. This company takes over the properties of the Armstrong-McGibbon syndicate, the 17 Dobie claims in Tisdale township, Porcupine mining district. All of the unissued treasury stock was taken up by the original syndicate, which also undertakes to provide the necessary money to develop the property. Charles E. Watson, who has been identified with the management of some of the most important properties in the Cobalt district, has assumed the management of the Tisdale Mining Company and will direct developments of the properties of this company.

Globe, Ariz.—While it was the intention of the Miami Copper Company to have its concentrator in shape to start at least one unit of its 2,000-ton mill by the first of the year there yet remain so many details that it seems that operations will not start before February next.

El Paso, Texas, December 28th.—An explosion of dynamite stored in a pit at the El Paso smelter has buried under the debris a score of workmen, many of whom, it is believed, have been killed. The smelter is the property of the American Smelting and Refining Company.—Reuter.

Washington, D.C.—Statistics and estimates received by the United States Geological Survey from all plants known to produce blister copper from domestic ores and from all Lake mines indicate that the copper output from mines in the United States in 1910 will fall considerably below the output of 1909, but will exceed the production of any previous year. The figures showing smelter production, which have been collected by B. S. Butler of the Survey, represent the actual production of each company for 11 months, and include an estimate of its December output. The November figures for a few companies were not available, and these companies furnished estimates for the last two months of the year. According to the statistics and estimates received the output of blister and Lake copper was 1,079,000,000 pounds, as against 1,092,951,624 pounds in 1909. Statistics showing the output of refined copper by plants in the United States are not collected by the Geological Survey at this time. Figures published by the Copper Producers' Association for the first 11 months of 1910 indicate that the production of marketable copper by the regular refining plants from all sources, domestic and foreign, will amount to about 1,448,000,000 pounds, as against 1,405,619,519 pounds in 1909.

Washington.—A bill which Senator Nelson of Minnesota will introduce will doubtless be regarded as the most thoroughly effective conservation measure that has ever been brought to the attention of congress. Senator Nelson, as chairman of the committee on public lands, has giveu careful consideration to this question and he has embraced in this bill which relates to Alaskan coal lands, two or three striking features, namely:—That the coal lands of Alaska shall be leased or operated under license upon conditions which shall place the question whether the price of coal so mined is fair and reasonable under the jurisdiction and control of the interstate commerce commission. That provision shall be made for payments of royalty to the United States on every ton mined. That no lease of coal lands shall be acquired except under regulations prescribed by the secretary of the interior who shall see that no monopoly in mining in Alaska be permitted. That provision be made for acquiring coal in Alaska for the use of the United States navy under a system of leases to firms or corporations who may con-

tract to furnsh coal for the navy at agreed price. Senator Nelson is engaged in considering a number of measures intended to conserve the national resources of the United States in the public lands and a general bill will soon be offered by him intended to secure for the United States all the coal and oil lands under systems of leasing and rentals somewhat along the lines of the Alaskan bill which he will present.

Ely, Nev., January 6th.—The year which has just closed has been a banner one for production for the Nevada Consolidated Copper Company. Few people living in the district, familiar as they are with the working of the great Eureka pit at Copper Flat, have any real conception of the vast amount of work which is going on there. Ore trains passing daily through the district, from the mine to the concentrator at McGill, tell in part the story of production; but the results at the end of the year tell the whole story. For the fiscal year commencing October, 1909, and ending September 30, 1910, the ore output was 2,237,-028 tons dry weight, the average assay of copper being 2.06 per cent. and about 22 cents in gold and silver. For the calendar year of 1910 the ore production will amount to 2,350,000 dry tons, averaging the same percentage in copper and the precious metals. All of this great output came from the steam shovel pit at Copper Flat, and there has been more than that in overburden taken from the workings. The stripping operations, meaning the removal of overburden from the Eureka ore bodies, must be kept in advance of the production of ore, and during the year, in addition to the output of ore there have been removed 1,650,000 cubic yards of this waste. In all the Eureka pit has been stripped over an area of 22 acre.s

So many factors enter into the determination of the output of copper that a forecast of the probable production for 1911 is of little value. During the latter part of 1910 several of the large companies were reducing their outputs and it is probable that this policy will be continued into 1911. Two large companies, the Miami Consolidated and the Ray Consolidated, will begin production early in the year, and the Chino Copper Company, and probably the Bonanza mine of Alaska, will be producers late in 1911, but so that unless there is a decided curtailment by the older companies the output for 1911 will exceed that of 1910.

Goldfield, Nev., January 7th.—An estimate of mineral production in the state of Nevada during 1910 places the total at $40,521,000, which is divided into counties as follows: Esmeralda, $13,311,000; Nye, $9,525,000; White Pine, $9,000,000; Eureka, $2,000,000; Humboldt, $1,500,000; Lander, $2,000,000; Storey, $1,500,000; Lincoln, $800,000; Churchill, $500,000; Clark, $200,-000; Elko, $50,000; Washoe, $25,000; Douglas, $10,000; total, $40,521,000.

WALES.

After having been on strike for two months 5,000 men employed at the Powell Duffryn Collieries, Aberdare, resolved at a mass meeting recently to resume work immediately and to relegate their grievances to the Conciliation Board. The 8,000 men at the Bwllfa and Cwmaman Collieries, who ceased work in sympathy, have resumed work.

SPAIN.

Spain, January 10th.—One hundred and ninety workmen in Anita mine, at Castro, Santander, Urdiales, were entombed alive when the roof of a shaft caved in. Fire followed the crash, which is supposed to have been caused by explosion.

Rescue parties were prevented from entering the pit mouth by the dense volume of smoke which rolled outward.

With great effort one party of rescuers were able to penetrate a short distance into the shaft and removed four dead bodies. Members of this party expressed the fear that all in the mine had perished, as the supply of air was cut off.

GENERAL MINING NEWS.

NOVA SCOTIA.

The strike situation at the Port Morien colliery is considerably improved, and is developing nicely toward a peaceable end of the difficulty. About half of the total number of employees are at work to-day. Nearly all that can be placed are now at work in the new section of the mine. The construction work in the old sections is proceeding well. Many who ceased work are anxious to go back, but it will be some time before places are ready for them. The statement that the company had violated the Lemieux Act is incorrect. There has been no violation of the Act, the management having notified the employees of the proposed reduction of rates for the winter as long ago as the latter part of November. Nor is it correct that the management has been notified by the labour organization of the claim of the latter that the company has violated the Act. No notice of the kind has been received by Manager McKenzie. It is reported, however, that former President Dan McDougall of the U.M.W. stated that their solicitor was writing a letter to the company to that effect.

Sydney Mines, Jan. 5.—The body of another victim of the No. 3 disaster was taken from the mine at three o'clock today. The body was that of Henry Purchass, a deputy, who with Archy Ferguson was inspecting the mine in that section where the explosion occurred. When found Purchass was lying face down across the haulage rope. Underground Manager John Hill, Henry Walsh, Peter Coll, and James Hurone, the advance guard of a searching party, came upon the body at No. 11 landing. These men had directed their search down the slope while another party was working towards them, having gone through the rooms off the last two levels. There was not a cut or bruise on Purchass' body, and it was at first thought that the man was alive. Doctors McDonald and Love quickly made an examination, but found that life had been extinct for some time. From this it is evident that unlike the rest, Purchass was not injured by the explosion but succumbed to the afterdamp. His lamp was found in his hand in the same condition in which it had left the lamphouse. The body after being prepared for burial was removed to the residence of Doran Ludlow, at Old No. 3, whose wife is a sister of Mrs. Purchass. Purchass was twenty-eight years of age, and was a native of Twilingate, Newfoundland. His widow and three children reside at Florence.

The bodies of five of the victims of the accident went down by the steamer Bruce to-night for interment at their homes in Newfoundland. These are: James Messervey and Israel Parsons, Sandy Point, St. George's Bay; John Wade and Brian Murphy, Colliers, Haley's Point, Conception Bay; Eugene Reid, Hearts Delight, Trinity Bay. The last named was only seventeen years of age, and came here but five weeks ago.

Sydney, N.S., Jan. 3.—A serious explosion occurred in the Nova Scotia Steel Company's No. 3 colliery at Sydney Mines this morning. At the time of the explosion there were eight men in the mine, whose names are said to be John R. McIntyre, Archie C. Ferguson, Hugh Dickson, Henry Purchass, Arthur Amy, James Bond and Luke Drivel. The two latter have been rescued and McIntyre has been brought out from No. 1 level to No. 5 level, where attempts are being made to revive him. The fate of the others is in doubt. The other levels are full of damp and the heat is very great. A heavy fall of roof in levels Nos. 11 and 13 followed the explosion. There is thought to be a fire in No. 14 level. A gang of 100 men have gone down as a rescue party. The bodies of six of the eight men entombed have been recovered. The bodies were huddled together and so badly burned that it was impossible t

recognize one from the other. Owing to the deadly gases the rescuers were unable to reach the bodies of Deputies Ferguson and Purchass.

QUEBEC.

Quebec.—According to the report of the special commission appointed to investigate the Chibougamou mining region, which is 125 miles northwest of Lake St. John, the prospects are not sufficient to justify the Government in building a railway extension there from Lake St. John. Since 1903, there have been reports of rich discoveries of gold, asbestos and other minerals, but the report declares that none of the discoveries of copper and gold are in deposits of such magnitude or promise as would enable the experts to state without a considerable degree of hesitation that they would, with further development, become "mines" in the strict meaning of this term. The reputed "finds" of silver, smaltite and cobalt bloom must be treated as false. As to iron, it is possible that large and pure bodies might be discovered, but the expense of prospecting and the remoteness of the district will be ample deterrents. The asbestos noticed in the working faces of the various open cuts is insignificant in amount. The commission was composed of Dr. A. E. Barlow, lecturer in economic geology at McGill, chairman; Prof. J. G. Gwillim, professor of mining at Queen's, and E. R. Faribault, of the geological survey of Canada.

ONTARIO.

Sault Ste. Marie, Jan. 6.—Some sweeping changes among the officials of the several departments of the Lake Superior Corporation came into effect with the advent of the New Year. The department of transportation is now under the general management of W. C. Franz, who retains his seat on the directorate, while the general management of the entire corporation falls to Vice-President J. F. Taylor. Other changes are understood to include the elevating of Mr. C. H. L. Jones to be assistant secretary-treasurer, and that Consulting Engineer Ernest becomes general manager of the steel plant and the Algoma Steel Co., while C. E. Duncan, superintendent of steel plate, becomes general superintendent, succeeding D. J. Williams, retiring.

BRITISH COLUMBIA.

Nelson, B.C., Jan. 6.—Another dividend of 30 cents and an extra dividend of 20 cents a share has just been declared by the Hedley Gold Mining Company. The property, the famous Nickel Plate, at Hedley, B.C., continues to produce the precious metal in substantial quantities. This company has only been in existence a little over a year, having acquired the Nickel Plate from the Marcus Daly estate in August, 1909, and with the disbursements will have paid back to its shareholders a total of $203,520, or profits at the rate of $1.70 a share, par $10. This is the fifth dividend during the current calendar year.

A general meeting of the shareholders of the St. Eugene Consolidated Mining Company, the Rossland Power Company, the War Eagle Consolidated Mining and Development Company, Limited, and the Centre Star Mining Company, Limited, is to be held at Rossland on Monday, February 6th next for the purpose of receiving the liquidators' reports.

COMPANY NOTES

DOMINION COAL DIVIDEND.

The Dominion Coal Company has declared the regular half-yearly dividend of 3½ per cent. on the preferred stock, payable February 1st, 1911. Books close 18th to 31st January, inclusive.

CUMBERLAND RAILWAY.

The annual meeting of the Cumberland Railway and Coal Company will be held on February 8th. Books close from February 1st to February 10th, inclusive.

CANADA COMPANY'S DIVIDEND.

The interim dividend of 10s per share just declared by the Canada Company is an increase of 2s as compared with the corresponding period of 1909, and reflects the increased prosperity that has attended operations this year. A statement of the land business down to the end of November shows that 4,244 acres have been disposed of, as against 4,562, the average price realized being $19.10, as compared with $14.91 per acre. This is an increase of 28 per cent. on the 1894 valuation. The cash receipts for the same period were £22,200, or £400 more than in 1909.

CROWN RESERVE.

When the Crown Reserve dividend and bonus of 15 per cent., payable January 16th, has been paid, the company will have paid back over half a million dollars more than its capitalization, the dividend record of the company being as follows:

Date.	P.C.	Bonus.	Amount
1908.—July 2nd	4	.	$ 70,752.56
1909.—January 15th	12	4	238,010.24
1909.—April 15th	6	9	265,322.10
1909.—July 15th	6	9	265,322.10
1909.—October 15th	6	9	265,322.10
1909.—December 20th	.	10	176,851.40
1910.—January 15th	6	9	265,322.10
1910.—April 15th	6	9	265,322.10
1910.—July 15th	6	9	265,322.10
1910.—October 15th	6	9	265,322.10
			$2,387,808.90
Payable January 16th, 1911	6	9	265,322.10

PROGRESS AT GRANBY.

At a cost approximating 10.20 cents a pound, Granby produced in November 1,410,261 pounds of copper, as compared with 1,184,234 pounds in October. Precious metal contents totalled 36,228 ounces of silver and 2,587 ounces of gold.

In November six furnaces of the smelter were in blast. Early in December another furnace was blown in, and soon after January 1st the eighth and last will be started, so that the entire battery will be in operation.

The company's copper product by months, in pounds, follows:

January	2,077,985
February	1,958,294
March	2,059,257
April	1,915,475

A Safe and Satisfactory Investment

The 7 per cent. Guaranteed Income Bond issued by the NORTH AMERICAN LIFE among other attractive features guarantees (when it becomes paid-up in 15 or 20 years) an income of 7 per cent. of the face amount of the Bond, or in lieu of this it provides for a handsome cash return,

The holder of Bond No. 13209 a prominent physician of many years' standing in a Western Ontario community, after drawing $570 cash surplus, is now receiving an annual income of $140. in connection with his $2000. Bond, which in addition is participating in the Company's surplus every five years.

The holder of Bond No. 9153, who is one of the leading educationalists of the Dominion, writing from Montreal under date of December 20th, says; "I am in receipt of your Company's cheque for $8,390. in settlement of my $5000 7 per cent Bond, which matured to-day, The total amount I paid in was $6965. and now I find you are able to hand me $2125. more than I paid, in addition to carrying my risk of $5000 for the last twenty years. In my opinion this result is remarkable, and should appeal to all thinking men.

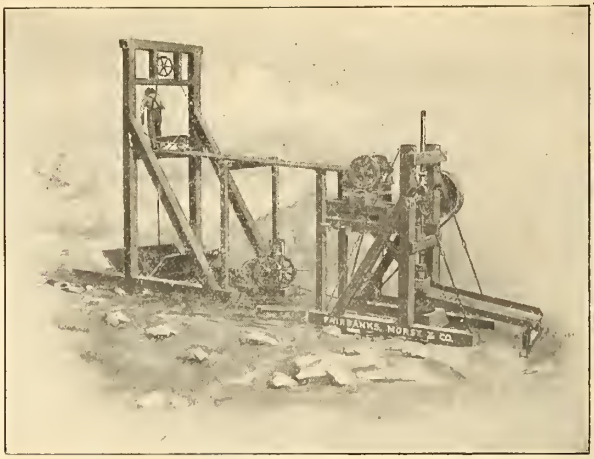
Prospector's Outfit

Fitted with NISSEN STAMP MILL



Nissen Mortar

A Boon to Prospectors

A simple, compact outfit, sturdy in construction and which is easily taken apart for transportation purposes. One man and a supply of gasoline is all that is necessary to operate the outfit.

It is fitted with a Fairbanks-Morse Gasoline Engine, which cannot be equalled for reliable continuous service. The stamp mill is a modern Nissen Stamp, the mill with largest capacity and smallest consumption of Power. Our Bulletin will tell you all about it. Send for it to-day.

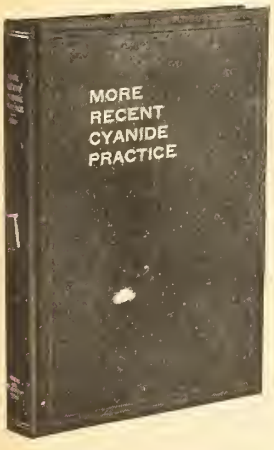
THE EXPERIENCE OF EXPERTS



More Recent Cyanide Practice

EDITED BY

H. FOSTER BAIN

424 Pages Indexed Illustrated

$2 POSTPAID

There is no information so valuable as the experience of the men who have designed, built, and operated notable mills, or the chemists and metallurgists who have solved difficult problems as they arose. This book contains articles by 82 men, among whom are the leaders in the cyanide industry. It is valuable as a handbook and together with the companion volume, 'Recent Cyanide Practice', makes an interesting compendium of the cyanide process.

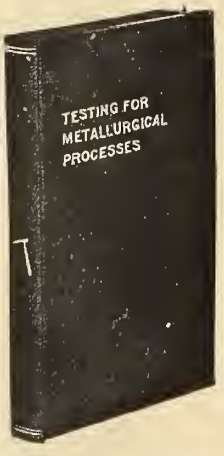
Testing for Metallurgical Processes



By JAMES A. BARR

216 pages
Illustrated
Indexed

$2 POSTPAID

This book is designed to assist in the selection of the process of treatment for any ore. The author describes the apparatus employed in making laboratory and small-lot tests. It is founded upon experimental work at the Michigan College of Mines, and the methods recommended have been tested in practice. It is brief and practical, equally valuable to the student and the practicing engineer.

Book Dept.

Canadian Mining Journal, Toronto

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

DEPARTMENT OF MINES. GEOLOGICAL SURVEY.

PUBLICATIONS

The Geological Survey has published maps and reports dealing with a large part of Canada, with many local areas and special subjects.

A single copy of a map or report that is specially desired will be sent to Canadian applicants free of cost and to others at a n price,

Most of the older reports are out of print, but they may usually be found in public libraries, libraries of the Canadian Mining Institute, etc.

A catalogue of publications will be sent free to any applicant. Reports that are out of print are indicated in the catalogue by a dagger.

Applications for publications should be addressed to the Director, Geological Survey, Ottawa, and should state definitely the precise area concerning which information is desired. It is often of assistance in satisfactorily filling an order for a map or report, if the applicant states the use for which it is intended. Letters and samples that are of a Departmental nature, addressed to the Director may be mailed O.H.M.S. free of postage.

THE standard treatise in English on general metallurgy. It is of the highest value and greatest practical use to every metallurgist. The sections on Alloys, Measurements of High Temperatures, Slags and Mattes are very important.

The author is President and Professor of Metallurgy, at the South Dakota School of Mines.

The Main Chapter Headings Are:

I.—The Metals and Metallurgy from the Historic Point of View. II.—Physical Mixtures and Thermal Analysis. III.—Physical Properties of Metals. IV.—Alloys. V.—The Physical Properties of Alloys. VI.—The Measurement of High Temperature. VII.—Typical Metallurgical Operations. VIII.—Slags. IX.—Matte, Bullion and Speiss. X.—Refractory Material for Furnaces. XI.—Fuels. XII.—Combustion. XIII.—The Production and Heating of Blast Furnaces. XIV.—An Example Illustrating the Physics and Chemistry of a Melting Operation. The Blast Furnace for Copper.

536 pages, 6x9, 188 illustrations, $5.00 (21s) net, postpaid.

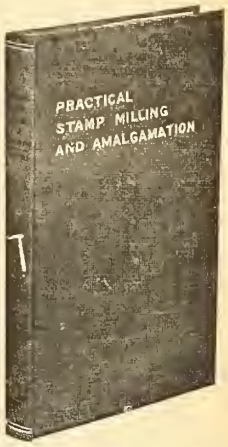
FOR THE MILLMAN

Practical Stamp Milling and Amalgamation



By H. W. MacFARREN

166 PAGES INDEXED

$2 POSTPAID

Written primarily for the millman himself, this book will prove of value to all those having to do with the milling of gold ores. Gives details needed in everyday work. The stamp mill, its location, and design; the mortar, die, shoes, tappet, and cam; adjustment of height, order of drop, feeder, and screens; water supply and power; principles of amalgamation and treatment of plates; retorting; loss of gold, mill tests, and mill management; all these are treated in an illuminating manner by one who has himself solved the problems.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals, extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The silver mines of the Cobalt district have astonished the world by their richness, and promising gold discoveries have recently been made in Porcupine Lake.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are: Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows:

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unsurveyed territory, is open to prospecting.

Miners' Certificates good for a calendar year may be obtained by sending $10 00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minimum being 40 acres in unsurveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of $10.00 plus a yearly rental of $1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed territory may be purchased as a mining concession at the price of $20.00 per acre if within 20 miles of a railway in a straight line, or $10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

The Hon. Minister of Colonization, Mines and Fisheries.
Quebec.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silve $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Mineral or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,0 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land h been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in t Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed Crown Grants.

HON. MINISTER OF MINES

The Three Most Important Mining Books of Recent Years

They Cover

PRINCIPLES—ECONOMICS—METHODS

Principles of Mining. By H. C. Hoover, $2.50 (10/6) net postpaid.

The principles of mining as developed by modern science and business methods are here fully discussed under the general headings of Valuation, Organization and Administration. Important chapters cover investment from the public's standpoint, and the character, training and obligations of the mining engineer.

Cost of Mining By James R. Finlay. $5.00 (21s) net, postpaid.

An economic investigation of the cost of scientific. profitable mining. It contains valuable data obtained from official reports of the mines producing 75 per cent. of the metal under discussion. Detailed analyses cover cost of mining *coal, iron, lead, zinc, copper, gold and silver.*

Timbering and Mining. By W. H. Storms, $2.00 (8/6) net, postpaid.

Deals with practical methods, not theories. A straightforward account of the best, safest and most economical methods employed in the leading American mines.

Allan, Whyte & Co.

CLYDE PATENT WIRE ROPE WORKS

Rutherglen, Glasgow, Scotland

WIRE ROPES

For Winding and Haulage in Collieries and Mines, Aerial Ropeways, Transmission of Power, Suspension Bridges, etc. SPECIALLY FLEXIBLE ROPES for Hoists, Winches, Loading and Discharging Cranes, Shipping Purposes, Towing, Alligator and Dredger Ropes, etc. SPECIAL ROPE FOR LOGGING.

Our Ropes are made from wire drawn for our exclusive use, and are at work all over Canada. Messrs. Nova Scotia Steel & Coal Co., Ltd., who use them largely, write that one of our haulage ropes at their Wabana Mine has been in use for **5 years**, drawing over 1,750,000 tons and still in good condition. From the Atlantic to the Pacific they are well known and our agents will be only too pleased to give all information to enquirers. They may be had from the following, viz :

Nova Scotia : Wm. Stairs, Son & Morrow, Limited. New Brunswick : W. H. Thorne & Co., Limited.
Montreal and Toronto : Drummond, McCall & Co. Vancouver, B.C. : John Burns, Winnipeg : David Philip, Portage Ave.

HIGHEST Quality. MODERATE Price. Prompt Delivery. SATISFACTION in use.

Cables : "Ropery, Rutherglen." Codes : A. B. C. (4th and 5th Editions), A.I., Liebers and Private

NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

"WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. It **does not freeze,** or rather, explodes with perfect efficiency when frozen and **needs no thawing.**

"AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appearance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

THE only High-class Hotel in the Gold Fields, and being enlarged to accommodate the numerous patrons now coming in. The "Shuniah" will then be in a position to give first-class modern service.

An Enquiry Bureau in connection with the Hotel has been opened, and also a competent Stenographer engaged for the benefit of our many Guests and Visitors.

FEW REPAIRS

It is not so much how many holes a rock drill will put in per shift—but rather how long it will stay down in the mine. We absolutely guarantee that

"The Cleveland"

Stope Drill will not only do as much work as any drill made, but it will go longer without any repairs, takes less time to make the repairs, and gives better satisfaction all the time. And that is some guarantee.

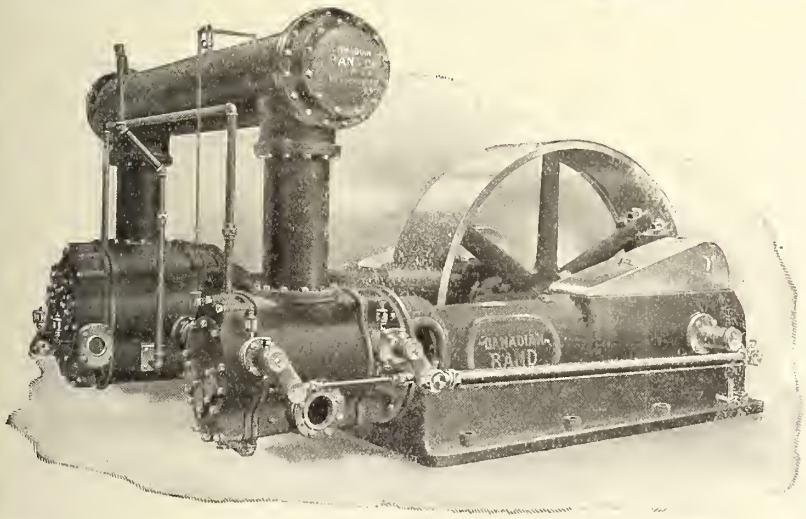
BEST FOR MINE BUILDINGS

Amatite has a genuine mineral surface.
This means that it requires no painting.
Contrast this with the fact that all ready roofings of smooth surface require painting regularly.
Figure out how much it costs you to paint the roofs of your mill, your shaft-house, repair shop and the other buildings?
Think of saving this amount not once—but three, four or five times—smooth-surfaced roofing requiring painting about every other year.
Amatite does not require any attention whatever after it is once laid.
Another point that recommends it to the Mine Manager is that it is easily laid and has galvanized nails and liquid cement in the center of each roll.
We can offer no more convincing argument in favor of Amatite than a sample of the roofing itself. The practical man recognizes its value immediately—its thickness, strength and durability.
We also have a booklet of facts. **Send your request for this free sample to the nearest office.**

THE PATERSON MANUFACTURING CO., LTD.

MONTREAL TORONTO WINNIPEG
VANCOUVER ST. JOHN, N.B. HALIFAX, N.S.

CLASS "RP-2" AIR COMPRESSORS



The Rand Class "RP-2." Duplex Power Driven Air Compressor combines the good principles of modern engine design with the best pneumatic practice.

The unusual capacity of Class "RP-2" Compressors is of course evolved through their high speed and high efficiency, but their massive enclosed dust-proof construction permits of high-speed without impairing the "Rand" reliability.

The superior quality of workmanship, rigid enclosed construction, exceptionally large bearing areas and efficient lubricating system which literally "floods" all important bearings, combine to give the high mechanical efficiency which characterizes this type.

Large free air ports, correctly controlled by improved Corliss Inlet Valves and "Imperial Cushioned High Speed Outlet Valves" insure highest compression efficiency.

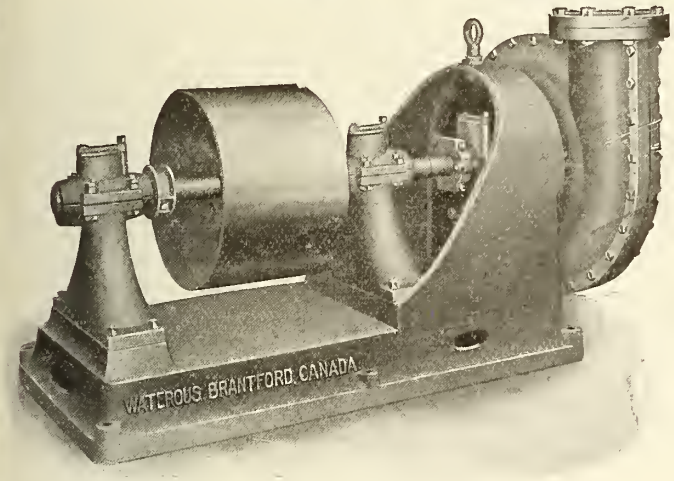
NOTICE
THE SPLIT-BASE
ITS NEW

The Waterous Pump
is built for Mine Work



It is simple in construction. It is built of few parts, there are no valves to get out of order, no restricted water-passages to clog up; there is not a complicated piece in its whole makeup.

It is built strongly throughout. Wherever wear is likely to occur the casting is re-inforced and strengthened to resist it. The materials used are selected, and the careful way parts are put together prevents wear and consequent slackness.

It is Easy to Operate. It can be left in care of an unskilled laborer without danger. All that is necessary is to start it running and to shut it off when the whistle blows. Overhauling and cleaning are made simple by the split-base and split packing gland—special features of this pump.

It is compact and comparatively light. It can be quickly and easily moved from place to place and will work well in almost any position.

The pumps are built in Horizontal and Vertical types. In sizes up to 14in. discharge opening. Are adapted for Belt, Engine or Motor Drive.

Why the C.P.R. North Toronto Route to Ottawa and Montreal is the Logical One

The train leaves as follows:

Leave North Parkdale - - -	9.15 p.m.	Leave West Toronto - - - -	9.30 p.m.
Arrive North Toronto - - -	9.40 p.m.	Leave North Toronto - - -	10.00 p.m.
Arrive Ottawa, 6.50 a.m.		Arrive Montreal, 7.00 a.m.	

Daily except Sunday.

¶ The residents of Toronto are adjacent to either North Parkdale, West Toronto or North Toronto stations, same being easily accessible and closer to residential districts.

¶ The North Toronto route is over an hour faster and overcomes a long hill climb for the train obviating any inconvenience and ensuring early arrival at Montreal and Ottawa.

¶ The roadbed has been improved till it is unexcelled in Canada. Practically half the line is double tracked.

¶ The equipment is "Canadian Pacific Standard," a synonym for the "best" and attentive porters, non-obsequious, ensure efficient service.

NOTICE.

THE OFFICES OF THE "CANADIAN MINING JOURNAL" WILL BE MOVED ON FEBRUARY 15TH, FROM ROOMS 312-313 CONFEDERATION LIFE BUILDING, TORONTO, TO THE MANNING ARCADE ANNEX, ROOMS 17-19-21. AN ALTERNATIVE ADDRESS IS 26 KING STREET WEST, TORONTO, ONT.

THE PROPOSED TARIFF CHANGES.

As we are going to press, announcement is made of the proposed tariff changes. The changes are much more comprehensive than had been expected. They include, we are gratified to note, several mineral commodities.

Amongst the mine products that are affected are the following:—

FELDSPAR, crude, powdered or ground, upon which there is a United States duty of 20 per cent., and upon which there is no countervailing Canadian duty, is now to be reciprocally free.

FLUORSPAR, on which there is a United States duty of $3 per ton crude, and 20 per cent. ground, and upon which no Canadian duty was imposed, is now to be reciprocally free.

MICA, unmanufactured and rough trimmed, and ground and bolted, is to be reciprocally free. The present Canadian preferential, intermediate, and general tariffs are respectively 15 per cent., 17½ per cent., and 17½ per cent. The United States duty is 20 per cent.

TALC, ground, bolted or precipitated, naturally or artificially, not for toilet use, is to be free. The present United States duty is one cent per pound.

From GYPSUM or PLASTER ROCK, crude, not ground, the United States duty of 30 cents per ton is to be removed. This is also the case with salt, from which duties of 7 cents per 100 lbs. and 5 cents per 100 lbs. are to be removed, respectively, by the United States and Canada.

ASBESTOS, both crude and ground, but not further manufactured, is to be free. Both countries are to wipe out a 25 per cent. duty on the ground, and Canada removes a 17½ per cent. duty on the crude.

COKE, upon which there is a United States duty of 20 per cent., with no countervailing Canadian impost, is to be free.

SODA ASH and SALTCAKE are placed on the free list.

The prohibitive duties on GRINDSTONES, unhewn

BUILDING STONES, ROOFING SLATES, etc., have been materially reduced.

On the part of the United States there has been a reduction of 5 cents in the duty on IRON ORE, making the present tariff 10 cents per ton.

As regards round and run-of-mine BITUMINOUS COAL, the Canadian duty has been brought down from 53 cents per short ton to 45 cents per short ton, as against the standing American duty of 45 cents per long ton.

* * * * *

If, as will probably be the case, these changes crystallize into actuality, then the mining industry of Canada will have received a strong stimulus. It will be noticed that amongst other minerals, gypsum, feldspar, fluorspar, and talc, both crude and ground, except in the case of gypsum, where only crude is admitted free in the United States, although both crude and ground are admitted here, are now reciprocally free. This means much to all of Eastern Canada, and will probably affect favourably Alberta and British Columbia. We regret, of course, that both ground and calcined gypsum have not been placed upon the free list. Nova Scotia and New Brunswick, with their enormous reserves of high grade gypsum, would have benefitted largely. But even the removal of the duty on crude will be of service.

As for feldspar, talc, and fluorspar, the commercial possibility of handling these minerals has been definitely enlarged. Feldspar mining is growing in importance every day. Apparently we possess the best and largest deposits on the continent, and there appears to be no reason why we should not curtail at once the shipment of crude and become shippers of ground feldspar.

The revision also provides an added outlet for our manufactured talc. The situation as regards mica and asbestos is improved. Fluorspar, mentioned above, is not yet mined in Canada, largely because of the very limited market and because of tariff inequalities. Now that these inequalities have been levelled, we shall hope to see two or more promising prospects developed.

As coke has been made reciprocally free, we shall expect a decided enlargement in the western output. Railroad tariffs are the controlling factor here. But any incidental amelioration of present conditions will be welcomed.

The whole question of mutual concessions in coal duties is too complicated to be discussed briefly here. We shall take this subject up at a later date. We may, however, remark here that this is at once the most vital and the most comprehensive topic of all.

In the main, we feel inclined to congratulate Canada's delegates upon having secured a fair quid pro quo. Canada is justly looked upon as the immediate source of raw material. Canada wishes to be looked upon more and more as the source of commercial products. The whole meaning of the tariff, or of any revision of the tariff, so far as Canada is concerned, lies in the opportunities afforded to establish manufacturing and milling plants on this side of the International Border.

THE BELLEVUE VERDICT.

The coroner's inquest into the cause of the death of 31 men in the Bellevue colliery on December 9th, has resulted in a formal verdict attributing the fatalities to carbon monoxide poisoning. This verdict, dealing solely with proximate facts, is of little significance. The five riders attached to the verdict are much more important. They are put in the form of recommendations and read as follows:—

"1. That more inspectors be appointed.

"2. That a Draeger apparatus station be established in this district.

"3. That telephones be established in underground workings under the supervision of the chief inspector wherever practical.

"4. That a thorough investigation be made of means of preventing loss of miners by cave-in in mines.

"5. We consider that negligence is in evidence on the part of operators and miners in the carrying out of the Coal Mines Act, and we would most strongly recommend a stricter adherence to the intent of the Act."

The first three riders are part and parcel of a necessary general movement. Inspection of coal mines in Alberta is casual, rather than systematic. Even if it were thorough, the means are lacking to make it effective. To be effective, inspection must be supplemented by rigidly enforced regulations. And, most assuredly, there must be a sufficient number of well paid officials appointed to cover the whole territory.

We are informed that, contrary to the recommendations of the manufacturer, the Draeger apparatus installed at Hosmer, B.C., which were hastily called into requisition after this Albertan disaster, were fitted only with 30-minute cylinders. The person or persons responsible for this gross error should be made to suffer. The modern respiratory apparatus is designed to supply oxygen to the user for approximately two hours. This by the way.

As pointed out in a former editorial, prevention through inspection and control of mining methods, explosives, lighting, and ventilation is the one prime necessity. Breathing-apparatus outfits are excellent accessories. But they cannot do more than supplement the work of complete inspectoral control. Mine telephones are also admirable and necessary devices. They also must be considered as units in a well organized system. No one device is a cure-all.

The last rider indicates that in the opinion of the coroner's jury there was evidence of carelessness on the part of operators and miners alike in carrying out the requirements of the Coal Mines Act, and strongly urges a stricter adherence to the intent of that Act.

In the course of the inquest evidence was adduced that proved criminal carelessness on the part of one of the miners, carelessness that implied a shocking lack of moral sense, and that, in itself, might easily have been the cause of the catastrophe. Such instances are not rare. It is hard to educate certain types of miners. While the great majority are intelligent and good citizens, the lives of hundreds may be jeopardized by the selfish recklessness of one. Hence it is imperative that steps be taken to inculcate into all a sense of personal responsibility. The individual who is willing to endanger the lives of his fellows should be treated as a criminal.

No sharp line can be drawn between management and men in the matter of responsibility. Usually both are culpable. Upon both devolves the duty of seeing to it that every possible precaution be taken to prevent the loss of life. In no less degree does the burden fall upon the Federal and Albertan Governments.

PORCUPINE PROSPECTUSES.

It appears impossible to rob the mining prospectus of its superfluous trimmings. Nor does it seem practicable to convince the promoter that a sound venture never requires bolstering with general quotations from other reports.

That recent incident, when the Hon. Frank Cochrane felt it his duty to correct a misquotation attributed to an English engineer, should go far towards clearing the atmosphere. The engineer in question had been credited in a newspaper advertisement with a sweeping eulogy of Porcupine. Of course, he had been guilty of no such silliness. But certain innocuous remarks of his had been garbled and mangled by the newspapers, and, falling under the eye of the prospectus-artist, had been promptly used. The Hon. Mr. Cochrane's correction was prompt and to the point. It is possible, even probable, that the inclusion of this quotation was done in all good faith. But it was totally unnecessary in any case, and, as the event proved, the quotation was not itself authentic.

Glancing over the prospectus that gave rise to the above-mentioned episode, we are surprised to find much evidence of carelessness and of absence of business acumen. For instance, on one page it is stated that more than fifty quartz veins have been uncovered. Later the number of veins is placed at ten. On one page, also, we are informed that stripping and trenching can be easily performed; whilst a few pages further on the opposite is affirmed. Moreover, the rash general statement is made that a certain vein will yield continuously handsome returns. This kind of vaticination has become unfashionable.

Promoters who are asking the public to take part in what may be a costly venture, can surely afford to put together a careful and accurate statement of facts. It is infra dig to permit sloppy errors and contradictions to creep into a prospectus. It is regrettably foolish to allow one's fancy to gild the future with imaginery gold. All this is not so much a question of honesty as it is a question of horse sense.

The function of a prospectus is to present observed facts, and not to lend fictitious value to unproved mining claims.

THE MINERAL PRODUCTION OF BRITISH COLUMBIA.

Promptly with the close of the old year, the preliminary estimate of British Columbia's mineral production during 1910 has been published by the Provincial Bureau of Mines. Mr. W. Fleet Robertson, Provincial Mineralogist, is the compiler of this timely pamphlet. Once again we must felicitate the occidental Province upon its enterprise.

Taking Mr. Robertson's estimates for 1910, we note that the net increase in non-metallic products is $2,809,116. Against this must be written off a net decrease in metalliferous products amounting to $1,068,636. This leaves a balance of $1,740,480 in favour of 1910 as compared with the gross output for 1909.

The appreciable falling off in copper, lead, and zinc was more than counterbalanced by an unusually substantial increase in the output of coal. The 1909 output of coal was 2,006,476 long tons. For 1910 the output was 2,800,000 long tons, an increase of 794,000 tons. This, as Mr. Robertson points out, is much larger than the two largest previous annual increases taken together.

Whilst slight enlargements of gold outputs, both placer and lode, are recorded, silver has fallen slightly. Apart from the disappointing results from the St. Eugene mine, the chief cause of the drop in lead production was the damage resulting from forest fires in the Slocan district. A larger output is predicted for the current year. The lessening of the copper output by about 6,000,000 pounds (the 1910 output being only 39,000,000 pounds), is not serious; new producing mines will bring up the 1911 totals. Zinc has been distinctly disappointing. The output for 1910 is but half of that for the previous year. Whilst there is no lack of ore, the forest fires delayed production considerably. The destruction of the Whitewater mill and the storage of a considerable quantity of concentrate by other operators contributed to cut down the returns. The outlook is not rosy, neither is it hopeless.

For 1911, prospects are in general most satisfactory. The Boundary country will, we doubt not, exceed itself. Coal production will certainly be largely expanded. The demand for coke will be distinctly better than during 1910. Gold should more than hold its own. Zinc may, or may not, gain a stronger position. One favourable symptom of 1910 was the payment of several considerable dividends by several of the larger companies.

Rand mines, during 1910, distributed a total of £9,115,500 in dividends. This enormous sum ineludes dividend payments from 45 eompanies. The largest dividend eame from the Crown Mines. It amounted to £1,128,126. The rates of payment ranged all the way from 5 per eent. to 150 per eent.

Correspondence

THE EXPLOSION AT BELLEVUE COAL MINE, ALBERTA.

Editor, Canadian Mining Journal.

Sir,—While on other pages of the Canadian Mining Journal of January 1st you referred to the loss of life in an Albertan colliery and the duty of the Alberta Government to provide for the family of Fred Alderson, who saerificed his life to save that of another miner, you also, in two parts of the same issue, left it to be inferred that the disaster oecurred in British Columbia. Knowing that you have from time to time freely accorded the British Columbia Department of Mines eredit and praise for having taken the lead in its efforts to safeguard the lives of miners employed in its eoal mines, I am well aware that you would not intentionally leave room for the eonclusion that there was or is any blame attaehable to that department for the lamentable loss of life that took place at Bellevue last month, yet I venture to think it may be well to make it quite clear that the following item, taken from your General Mining News of the above-mentioned date, lacked the speeifie information that the disaster took plaee in Alberta, not in British Columbia. I quote the news item as you printed it:—

BRITISH COLUMBIA.

"Fernie, December 13.—Six of the Slav victims c the Bellevue disaster were buried here in one grave, an the body of Fred Alderson will be interred at Hosme to-morrow."

"It is a significant fact in eonnection with the di aster that a Government mine inspeetor viewed th mine for eseaping gas three days before the fatality, an posted a notice to the effect that the timbering an ventilation were good, and that there was no gas.

"The Miners' Union had asked that an inspeetion c the mine be made and told Inspeetor Sterling, it stated, that there were volumes of gas in the mine. It thought that there is yet one unrecovered body."

You will probably agree that in the foregoing there absolutely nothing to indicate that the disaster an suggested inefficient mine examination were in anothe Province, for British Columbia is the only Provinc mentioned—henee this letter.

Separately, I send you some particulars of the la Fred Alderson, who for the benefit of a strange min —not even a working eomrade in the mine in which h was employed, but an utter stranger in a mine in a other province, to whieh he had hastened on the eall the eommon humanity that prompts miners to deeds heroism—took the grave risks whieh eost him his li and left his wife a widow, and his ehildren, orphan You will note, too, that the British Columbia Gover ment was prompt, first to send its mine-rescue appa atus to a provinee that had negleeted to provide an and, next, to contribute money for the relief of the di tress of Alderson's widow and orphans.

E. Jacobs.

Vietoria, B.C., January 13, 1911.

ABSTRACT OF PRELIMINARY REPORT ON THE MINERAL RESOURCES OF THE CHIBOUGAMOU REGION.

I.—Introduction.

Object of the Present Investigation:

The present investigation was designed to obtain the fullest information from a single season's field operations regarding the natural resources, espeeially from the mining standpoint, of what has been ealled the "Chibougamou Mining Region," with speeial referenee to the asbestos and gold deposits already diseovered there.

Ever sinee the first mineral discoveries in this district in 1903, the Government of the Provinee of Quebee had been repeatedly and strongly urged either to undertake the building of a railway to Chibougamou or to give sueh substantial assistanee that private enterprise would be indueed to undertake its eonstruetion. Before however, eommitting themselves to any policy or definite line of aetion, which in any case would involve the expenditure of a very large amount of publie money, the Prime Minister and the Minister of Mines, on the recommendation of the newly appointed Superintendent of Mines, determined to obtain the judgment of those who compose the present Chibougamou Commission, not only as to the real value of the mineral diseoveries already made, but also their opinion as to the future mining possibilities of this region.

With this object in view the present Commissione examined in detail all of the prospeets and mini development work which they could find or eoncer ing which they had any information. In addition careful and critieal geologieal examination was ma of the whole district in order to make possible the pr paration of a geological map whieh would show t relations of the various mineral deposits studied. T Commissioners, therefore, in the present report, aim answer the question, "Is the construetion of a railw at present justified by reason of the mineral diseoveri already made and partially developed?" And in t second place to furnish in detail the results of the va ous surveys and examinations arising out of this i vestigation.

Personnel of the Chibougamou Commission:

As it was desired that the verdiet of the Commissio ers should be as eonclusive and authoritative as p sible, it was decided that Dr. Alfred E. Barlow, Spec Lecturer in Eeonomie Geoloy at McGill University, a late of the Geological Survey of Canada, should act Chairman, while Professor J. C. Gwillim, Professor Mining at Queen's University, Kingston, and Mr. E. Faribault, of the Geological Survey of Canada, shou

be the other Commissioners. Professor Gwillim, with Mr. A. M. Bateman, B.Sc., as assistant, devoted most of his time and attention to a critical examination and study of the numerous prospects, while Mr. Faribault's judgment was eagerly sought and appreciated in the appraisal of the gold discoveries. Dr. Barlow's work consisted primarily in the study and mapping the distribution of the several geological formations, although considerable time was devoted in company with Prof. Gwillim to the examination of the mineral deposits. In addition, Dr. Barlow, as a consequence of his direct control of the whole investigation, devoted considerable time and energy in the necessary administrative work. As it seemed desirable to cover as much of the territory as possible during the comparatively short season available for the work, the party was made unusually large.

On arriving at the scene of operations it was found expedient to sub-divide the large party into several smaller parties, each carrying on independent work, but reporting at frequent intervals to headquarters. In this way it was found possible not only to embrace the whole of the Chibougamou Mining region with a rather detailed and critical reconnaissance, but also to examine and study very closely the origin, mode of occurrence and geological relations of the various mineral deposits.

Mr. J. H. Valiquette, Q.L.S., the Assistant Superintendent of Mines of Quebec, and Mr. Arthur J. Merrill, of McGill University, did most of the topographical work, although after his arrival in the district Mr. Faribault did a very large part of this work.

Mr. Valiquette was assisted in his work by Mr. Eugene Poitevin, jr., of the Laval Polytechnic School, Montreal, while Mr. A. O. Dufresne, of the same institution, acted as assistant to Mr. Merrill. Mr. Theodore Lefebvre, of Montreal, assisted Mr. Faribault for a short time, afterwards joining Mr. Merrill's survey party.

The Commissioners wish to take advantage of this opportunity to express their keen appreciation of the zealous and intelligent work of all who aided in the scientific part of the work, often in the face of many adverse circumstances.

Our grateful acknowledgments are due to Mr. Reginald W. Brock, Director of the Geological Survey of Canada, for maps and the loan of certain surveying instruments which it was impossible to obtain by purchase during the short interval between the organization and the departure of the expedition.

ITINERARY:

The Chairman of the Commission accepted office on February 15th during a personal interview with the Premier, Sir Lomer Gouin. Owing to certain other engagements it was impossible for Prof. Gwillim to accept until March 17th, while Mr. Faribault's agreement to join the Commission was not possible for the same reason until April 28th, and it was further stipulated that he should not leave Quebec for Chibougamou until July 15th.

The chairman, in company with Mr. Valiquette, paid a short visit to Roberval on March 23rd for the purpose of inspecting the supplies which had been ordered for the expedition and which left Roberval the following day.

The expedition left the end of the portage which comes down to the Ashuapmuchuan River on the northeast side almost directly opposite the River aux Trembles (Poplar River), on Wednesday, June 15th, at 7.30 in the morning, and reached the headquarters camp at Pointe aux Bouleaux (White Birch Point) on Thursday, June 30th, at 1.30. The time thus occupied in actual travelling was 13½ days. The six canoes used were made specially for the expedition by the Ontario Canoe Company, of Peterborough, Ont., and were of the larger sizes of what are known as the explorers' canoes. They were built of cedar covered over with painted canvas. Each canoe, in addition to its crew of from three to four men, carried about 700 lbs. of supplies and luggage.

The main party left the headquarters camp on Monday, September 19th, at 6.30, and travelling by way of the Chigobiche River, reached St. Felicien on Friday morning, September 23rd, at 9.30 a.m. Dr. Barlow and Messrs. Faribault, Valiquette and Bateman, by leaving the main party at the foot of the Pimonka Rapids, and travelling by way of the Riviere aux Trembles and the Village of La Dore, reached St. Felicien at 11 p.m. of Thursday, September 22nd.

Saturday and Sunday, September 24th and 25th, were occupied in settling up accounts, packing and storing outfit, when the whole party left Roberval for Quebec, reaching the latter place on the morning of the 26th.

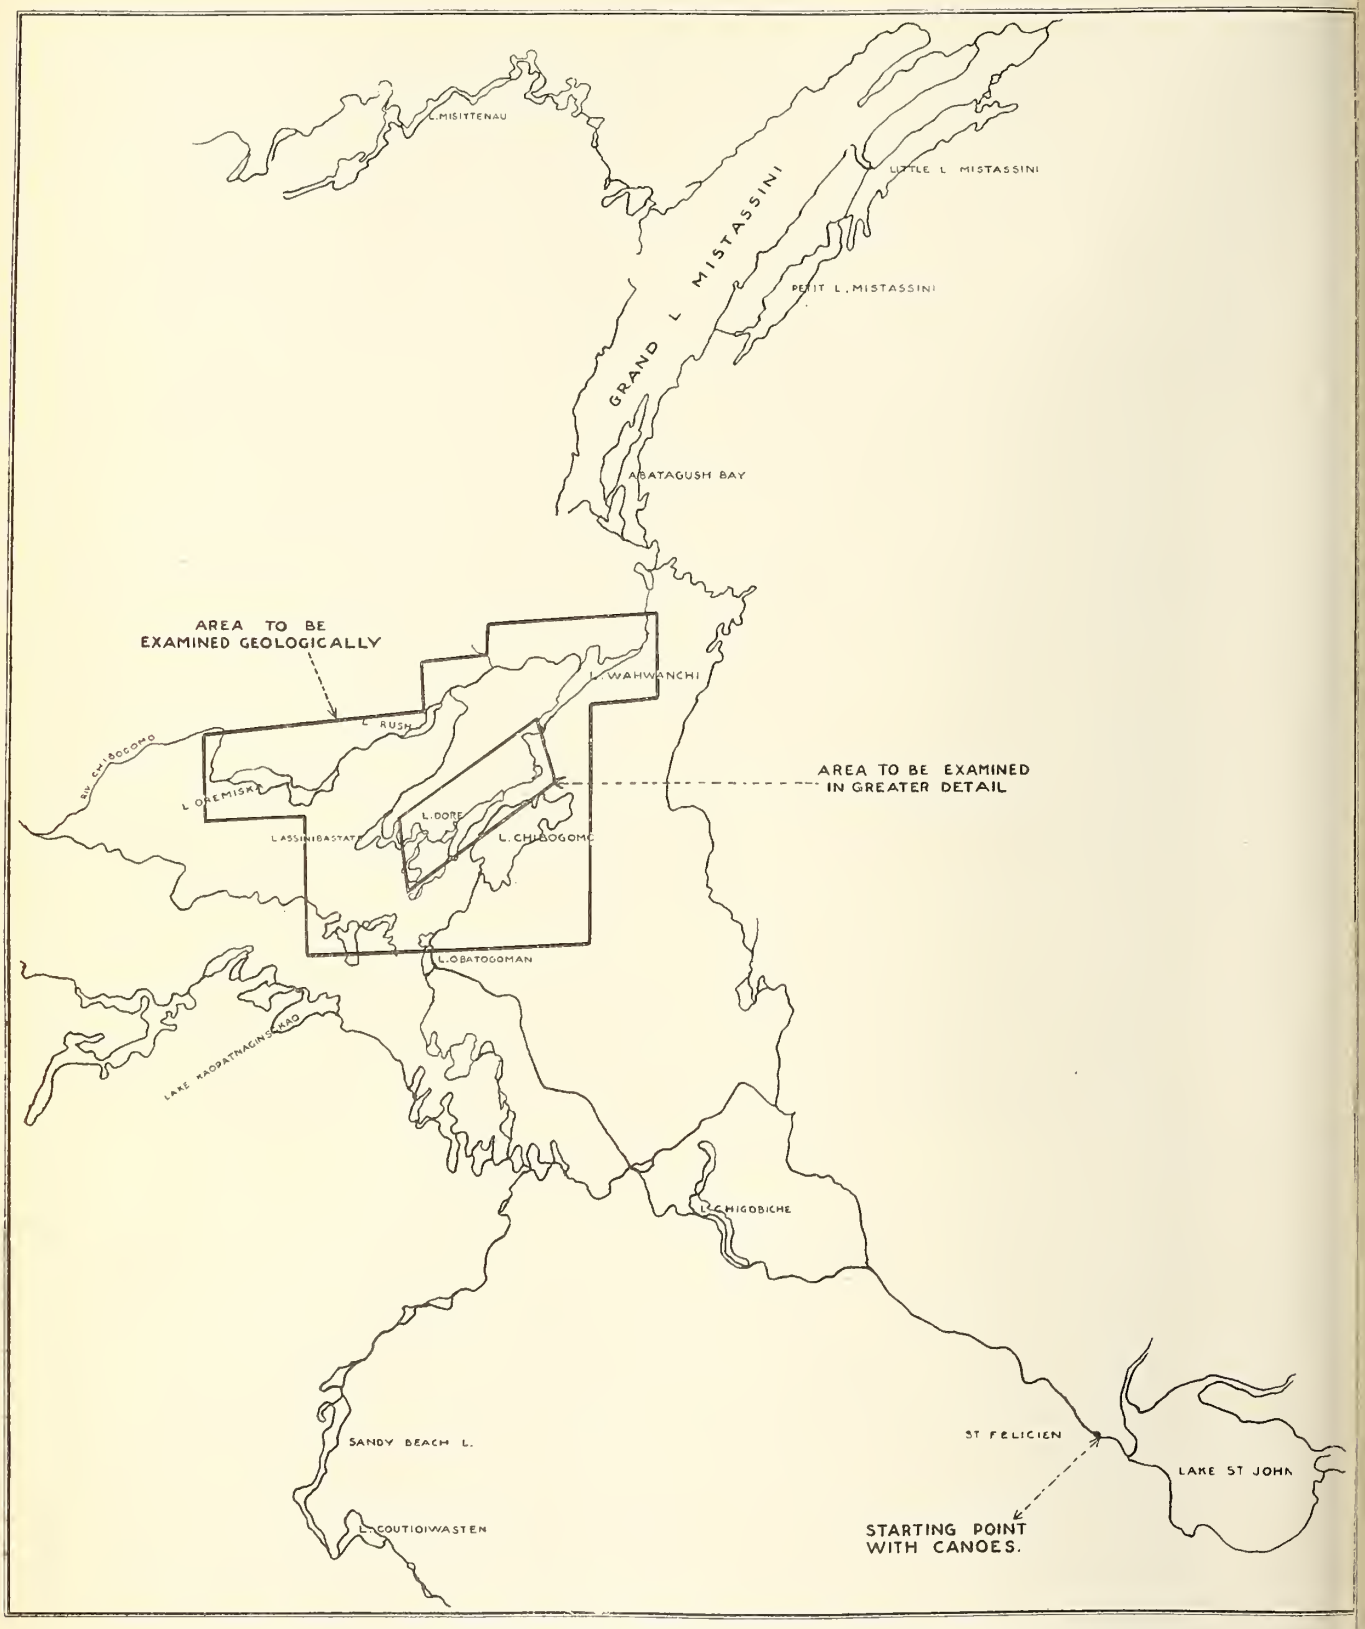
METHODS OF FIELD WORK:

The inadequacy for our purposes of the first surveys, as shown on the previous official maps of the district, became apparent soon after our arrival and preliminary examination of the district, so that it was found necessary to re-survey all of the principal lakes and watercourses. The results thus obtained, while not altering to any very great extent the general and relative position of these physical features, enabled us to depict our observations on the resulting map which accompanies this report in much more detail and with much greater accuracy.

The distances were measured with a Rochon micrometer telescope in terms of a known base, while the directions were determined by prismatic and surveying compasses. In the northern portions of Lac Dore and Lake Chibougamou and the route from Mackenzie Bay to Wakonichi Lake and from the southwest bay of Lake Wakonichi as far as and including Lac Bourbeau, the angles of direction were taken by means of a Gurley light mountain transit.

The distances obtained from point to point were further utilized as bases for a compass triangulation by which the position of many of the smaller islands and some of the more conspicuous points otherwise inaccessible were defined with sufficient accuracy.

In this way detailed surveys were made of the whole of Chibougamou Lake, including the large and irregular indentations known as Island and McKenzie Bays, as well as the bay which extends such a long distance towards the southwest. Chibougamou River was also surveyed as far as its outlet from Little Rush Lake, including Dore, David, Simon, Assinitchibastat and Rush Lakes. In addition to this, Wakonichi Lake was scaled as well as the route south to McKenzie Bay of Chibougamou Lake, and the route northeast from Wakonichi as far as Lake Mistassini. The crooked river which forms the canoe route from the northwest corner of Lake Wakonichi to the Chibougamou River and its tributary, the Chebistuenekan River, were also measured. Lake Bourbeau was also surveyed, including the route from its northeast bay to the southwest arm of Wakonichi Lake. Besides these a few of the more important tributaries of the Chibougamou River between Assinitchibastat and Rush Lakes, were ascended and surveys or sketches made of them. Besides, a survey was made of the Rapid River and the lakes which form its headwaters.



This map is from an old drawing. It is not revised to date.

THE AREA EXAMINED.

The altitudes of all the principal elevations were obtained by repeated observations with sometimes three aneroid barometers which had previously been compared with the mercurial barometer. An attempt was also made to determine by means of these same instruments the difference in elevation of all of the lakes, as well as to gauge the levels of the various streams, but with only indifferent success. These elevations have not as yet been fully correlated with one another an Lake St. John, and cannot, therefore, be given in th present preliminary report.

All of the mineral deposits were carefully sample by Messrs. Gwillim and Bateman and the resultin assays are included as part of Prof. Gwillim's report.

A systematic and typical series of all the rock typ recognized in the district was collected, and from the

the usual transparent thin sections have been prepared for examination under the microscope. These are now being carefully studied and their detailed description will be included in the final report to be issued later.

The map accompanying this report has been compiled by Mr. J. H. Valiquette under Dr. Barlow's direction, and is on a scale of 40 chs. (½mile) to an inch. It is not intended for final publication, but is included with this present report for purposes of illustration and elucidation of the various descriptions of localities.

There is also included a contoured geological map of part of Asbestos Island to show the principal excavations and pits. This is on a scale of 100 feet to the inch, with 25 foot contour intervals.

A large series of photographs (5 inches by 7 inches) was taken and the negatives developed in the field. It is intended that six albums, each including a complete set, will be prepared, three of which will be handed to the Department, while the Commissioners will each receive one.

These photographs are illustrative of the physical and geological features, as well as of the principal mining development work.

LOCATION AND AREA:

The position of the Chibougamou Mining Region covered by the work of the Commission extends from 49 degrees 30 feet to 50 degrees 15 feet north latitude and extends westward from 73 degrees 50 feet to 74 degrees 45 feet, thus embracing a rectangle measuring approximately 40 miles from east to west and 38 miles from north to south, or an area of 1,520 square miles.

The southern boundary of this rectangle is 300 miles almost directly north of Montreal, or nearly 250 miles N.N.W. of the City of Quebec. The southern end of Chibougamou Lake is about 125 miles in a straight line northwest from Roberval on Lake St. John. By the canoe route following the Ashuapmuchuan and Chigobiche Rivers, this same locality is 200 miles from Roberval, but by using the wagon road from Roberval by way of the Village of St. Prime and St. Felicien to the Ashuapmuchuan River opposite Riviere aux Trembles (Poplar River), this distance is reduced to 185 miles. From the south end of Lake Chibougamou to our headquarters camp at Pointe aux Bouleaux, is 9.5 miles.

MEANS OF COMMUNICATION:

Being situated on the other side of the height of land dividing the waters flowing south from those flowing to the west and northwest, this region can only be reached by ascending, to its head waters, one of the larger tributaries which enter the St. Lawrence from the north. Of these the Gatineau, St. Maurice and the Ashuapmuchuan are the largest, most easily navigable and the most direct. The shortest and probably, therefore, the easiest route is that which has been usually followed by way of Roberval and Lake St. John. With the construction of the Grand Trunk Pacific Railway, a shorter and better route will no doubt be found by way of the lakes and streams near the head waters of the St. Maurice River, but pending the completion of this railway, the usual route which was followed by the Commission is much to be preferred.

The Quebec and Lake St. John Railway reaches Roberval on the west shore of Lake St. John about 9 miles from the mouth of the Ashuapmuchuan River (usually abbreviated Chamuchuan). From Roberval, canoes and provisions may be transported by wagons (14.5 miles) or by steamer by way of the lake and river to St. Felicien, a village on the southwest side of the Ashuapmuchuan River (18.5 miles).

St. Felicien is really the assembling place for the guides, most of whom come from Pointe Bleue on the Indian Reservation, and the starting point of all expeditions. From St. Felicien canoes and provisions should be transported by carts to the mouth of the Riviere aux Trembles, the old route to the head of the Bear Portage (Portage a l'Ours) having been superseded by this one, which reaches the stream some miles further up and avoids three portages.

From St. Felicien there is the choice of two routes. One road follows the west side of the Ashuapmuchuan River by way of the Village of La Dore and reaches the Riviere aux Trembles (Poplar River) about 3 miles above its confluence with Ashuapmuchuan River. The last three or four miles of this road is bad, as it passes over a flat burnt, sand country, which is now covered with a very scanty growth of small jack pine. At rather frequent intervals it also passes through black spruce swamps. It has simply been cut out of the thin forest with little or no improvements. The Riviere aux Trembles is a shallow and crooked stream with many sand bars and is scarcely navigable by loaded canoes in dry weather. The route on the east side passes over a fine new bridge (Carbonneau Bridge) nearly 2,000 feet in length and is that usually travelled to Normandin and the settlements on the Mistassini River. A branch from this road about 5 miles in length reaches the Ashuapmuchuan River, almost directly opposite the Riviere aux Trembles. This last 5 miles is very bad through a jack pine plain road running over and between sand dunes. This latter route taken by our party is about 18 miles in length. It has little if any advantages over the road on the west side and is considerably more expensive by reasons of certain exactions by certain of the local people who pretend to have improved the road.

Table of Geological Formations.

The rocks of the Chibougamou Mining Region, arranged in the order of their geological age, may be tabulated as follows in descending order:

1. Quaternary.....Sands and Gravels, Boulder Clay.
2. Lower Huronian.....Slates, sandstones, arkoses and glomerates.

GREAT UNCONFORMITY.

IGNEOUS.

(Intrusive and of Different Ages).

3. Laurentian.....Granites. Granite and Diorite Gneiss, Igneous Contact.
4. Anorthosite.....Gabbro, Igneous Contact.
5. Keewatin.....This series includes the asbestos bearing serpentines which are altered dunites and conglomerates. quartz porphyries and porphyrites, amygdaloidal basalts, diabases and gabbros.

General History.

This will deal with the early exploration and development of the district and will be fully treated in the final report.

PREVIOUS WORK:

A summary of this has been given by Prof. Gwillim in his report which is appended.

It will also be much more fully treated in the final report. It will then include a statement in as concise a form as possible, of all the previous reports, bearing on

the geology, topography and natural history of this region and that to the southeast by which it is reached.

Summary of Conclusions.

General Geology and Age, Relations and Formations.

The area under consideration is underlain by rocks of Archæan or Pre-Cambrian Age. These are included in the Keewatin, Laurentian and Lower Huronian formations. In addition a rock which seems peculiar to this Archæan area has been called and the name is here retained "gabbro-anorthosite," because, although it is of gabboric type, there is a marked absence or paucity of ferro-magnesian minerals, which are almost invariably present and sometimes abundant in typical gabbros. In this respect the rock resembles the anorthosite formerly classified as Upper Laurentian.

The Keewatin formation is important from an economic standpoint, because it includes certain serpentinous rocks (altered dunites and peridotites) portions of which contain veins of asbestos. These are the oldest rocks of the district. They are penetrated by the batholithic mass of the gabbro-anorthosite already mentioned and which, as shown in the map, extends in a west-southwest direction from the Bay of Islands across Chibougamou, Dore, Cache, David and Simon Lakes, where it seems to end abruptly, being replaced in this direction by granite and granite schist breccia. The northern contact of this mass with the Keewatin rocks is economically important, because it is in this vicinity usually in the green schists of the Keewatin, but also sometimes in the anorthosite gabbro itself, that the gold-bearing quartz veins have been developed. Indeed it has been established almost beyond a doubt that the intrusion of the gabbro-anorthosite has been the direct cause of the formation of these quartz veins in which gold as well as copper has been found. Such quartz veins with chalcopyrite (copper pyrites) and occasionally dikes containing the same mineral are deposits which owe their presence to the differentiation of the same magna from which the anorthosite gabbro has solidified. In addition, the deposits of chalcopyrite and pyrrhotite occuring at Copper Point on Portage Island, are similar in origin, though much smaller in volume, to the nickel and copper deposits of the Sudbury district. They are thus a direct differentiate product of the anorthosite-gabbro, and occur close to the line of junction between this rock and the Keewatin green schists. The titaniferous magnetite deposits found at Sorcerer Mountain, north of Copper Point, and also on the islets near the southern or main outlet of Lake Chibougamou are also of magmatic origin and occur at or in the immediate neighbourhood of the line of junction between the anorthosite-gabbro and Keewatin green schists.

This gabbro-anorthosite is also an economically valuable rock formation, because the feldspathic dykes, which cut the serpentines on the shores of McKenzie Bay and Asbestos Island, are believed to be the surface expression or upward extension of the anorthosite-gabbro. It is the intrusion of these dykes which has contributed to the formation of the silky asbestos at Pits 3, 4 and 7, while the presence at the surface of a small dyke of similar material a short distance northeast of No. 6 Pit, may be an indication that the main body of the gabbro-anorthosite is not very deeply buried in the vicinity of Pits 1, 2 and 6.

Both the Keewatin schists and gabbro-anorthosite are intruded by certain granites and diorites, some portions of which, especially near the junctions with the older rocks, are very plainly foliated. From their general composition, appearance and geological relations, these rocks have been classified as Laurentian. Both the gabbro-anorthosite and the granite in certain areas intrude the Keewatin in the most intricate manner, forming a breccia which in certain localities underlies a comparatively large area, as on Assinitchibastat Lake in the vicinity of and opposite to the inlet (Chibougamou River).

The Lower Huronian is represented by certain conglomerates, arkoses, sandstones and slates which either in horizontal position or in low broad anticlinal and synclinal folds rest unconformably upon the upturned edges of the Keewatin and the uneven or the hummocky surfaces of all the older rocks which have already been described.

These conglomerates when resting directly upon the Keewatin often contain very few pebbles, while the greenish chloritic matrix, in which the pebbles are embedded, is by far the more abundant portion of the rock. Where, however, they rest directly upon the granites or gneisses of the Laurentian, the lower beds are an arkose conglomerate or arkose made up almost altogether of the broken up fragments of the granite. The Lower Huronian presents a transition upward from a basal conglomerate usually into arkose or arkose-quartzite; these in turn pass into comparatively dark grey or greenish grey feldspathic sandstones and these again upward into slates which sometimes show the cleavage planes as quite distinct from the bedding. Sometimes there is an alternation of coarser and finer grained sediments, so that at the tops of some of the hills as on Wako Mountain, we find in the upper beds a comparatively coarse conglomerate, while further down the hill were noticed strata of sandstone and slate.

Economic Geology:

From an economic standpoint the junction between the gabbro-anorthosite and Keewatin schist is perhaps the most important geological feature in the district, for it is at or in the immediate vicinity of this line of structural weakness that the copper bearing quartz veins, in which gold has been discovered, occur. It is in this neighbourhood also that the iron (magnetite) of Sorcerer Mountain and the sulphide deposits carrying small amounts of gold and nickel of Copper Point, occur. Both in the gabbro itself and in the Keewatin green schist, veins and patches of quartz and sometimes calcite and dolomite, often occur either with or without sulphides, but their small size and irregularity would seem to be serious obstacles to their economic development as mines.

Serpentine and Asbestos:

The serpentines of Rapid River, McKenzie Bay, Lac Bourbeau and Assinitchibastat result from the alteration or decomposition of certain dunites and peridotites. These serpentines are very dark green in colour sometimes almost black, and have a distinctly harsh rather than an unctuous feeling characteristic of pure serpentines, except in the vicinity of certain feldspathic dykes, and other favoured localities where almost all of the iron has been leached out and removed to other places, leaving a comparatively small band (3 to 6 inches in width on either side of the dyke) of very pure pale green serpentine.

In certain places, usually in the immediate (3 to 6 inches) vicinity of the feldspathic dykes, small veins of silky asbestos have been found, many of which are of a high grade, but these do not constitute a large percentage of any considerable bulk of the rock, nor are they continuous for any great length, as they are subject to frequent dislocation and faulting and very often

thin out altogether in every direction. Most of these veins vary from the thickness of a knife blade up to a quarter of an inch and the widest is not more than three-quarters on an inch.

Geological Probability of Occurrence of Gold:

As has been already mentioned, the rocks embodying the whole area examined by the Commission are of Archæan or Pre-Cambrian Age. This, therefore, in common with other similar areas of our hinterland, is very promising from a mining geological standpoint. The large areas of Keewatin schists present precisely similar rock types as have been found associated with the gold of the Porcupine and Larder Lake gold districts in Ontario, while the geological relations so far as known are not dissimilar. In addition the almost invariable presence of gold in the quartz and its occurrence over such a wide area, although usually in a small amount, is distinctly encouraging and should stimulate prospecting if the region was not so usually and deeply covered with peat and moss, and if it was not so remote from civilization and thus difficult of access. The sulphide deposits of Copper Point are also worthy of further development work. This occurrence seems to have puzzled the earlier mining engineers at this place and under these conditions. None of the discoveries of copper and gold is in deposits of such magnitude or promise as would enable your Commission to state without a considerable degree of hesitation that they would with further development become "mines" in the strict meaning of this term.

Possibilities of Asbestos:

Although the possibilities of the Chibougamou serpentine as an asbestos producer have not been exhausted by the mining development work so far undertaken, the results so far are decidedly disappointing. The amount of asbestos noticed in the working faces of the various open cuts and workings as well as in the dumps, is insignificant and altogether insufficient for their successful exploitation as mines. The previous reports on the occurrences of this mineral are, to say the least, optimistic and misleading. Not only does the serpentine of Chibougamou cover a much less area than was described and outlined in previous reports and maps, but the serpentine itself is much less pure, except in very restricted outcrops, and as a consequence is very much less in area than that of the Eastern Townships with which it has been compared. In addition, the geological relations are essentially different from Thetford and Black Lake, for whereas at these places the differentiation in the magma as shown by the various rock types extends to the most acid phases and is therefore very complete, the most acid rock type noticed at Lake Chibougamou is only at most of intermediate composition as exemplified by the feldspathic dykes already mentioned as cutting the serpentine.

Possibilities of Iron:

The deposits of iron ore (magnetite) which are perhaps large and more typically exposed on the southern face of Sorcerer Mountain than elsewhere in the region, are not of any great importance at the present time.

The chief occurrences of pyrite are on Portage Island near the northern end of Paint Mountain. The mineral here occurs as abundant disseminations in chlorite schist and decomposed diabase. No large body of pure pyrite capable of economic development as a source for sulphur was, however, noticed. Similar outcrops on one of the western summits of Sorcerer Mountain may be a continuation of this belt, but here likewise no massive deposit was found. Similar occurrences, some richer and some leaner, are by no means uncommonly met with in the Keewatin formation of Northern Ontario and Quebec; in fact, their frequency seems to be a characteristic of this formation. It is possible that a large and pure body of pyrite might be discovered, but the expense of prospecting and the remoteness of the district will be ample determents.

No Probability of Silver or Cobalt at Chibougamou:

The conglomerates of McKenzie Narrows, McKenzie and Rapid Bay on Lake Chibougamou, as well as those on Wakonichi Lake, are of Lower Huronian and thus presumably of the same geological formation as those of Cobalt, in which many of the silver veins of Cobalt have been found.

The newer diabase, however, which is the real "silver bringer" and to whose intrusion the silver bearing veins owe their presence, was not found, although careful search was made for it.

It is not likely, therefore, that any similar deposits will be found in the Chibougamou Region, and the reputed "finds" of silver, smaltite and cobalt bloom must be treated as false. It is possible, although unnoticed by any member of your Commission, that cobalt bloom may occur in small amount, but an examination of the localities where it was reported as occurring, failed to show any sign of this mineral, while the rocks themselves at one of these places was not at all favourable to its presence.

Occurrence of Lead and Zinc at Mistassini May be Important:

Galena and zinc blende are present, both in small amount, in the flat lying limestones occurring at the Narrows about two miles north of the Hudson's Bay Company post at Mistassini. Although the deposits there examined are not economically valuable, the presence of these minerals, even in small quantities and in such geological association, is of somewhat more than scientific interest, as it is under precisely similar conditions that the great deposits of the Mississippi Valley occur.

(To be continued.)

The Investigation and Development of Gold Areas,

(Written for the Canadian Mining Journal by R. B. Lamb.)*

The examination and development of gold-bearing deposits present some features so very different from other metalliferous ore bodies that discussion and consideration of their many problems is always in order.

Too much reliance is invariably placed upon immature observation and assay values of grab samples of gold-bearing rock.

Nothing should be so vigorously condemned as the faith placed in samples selected by untrained samplers. Such information is uniformly misleading and is the source of false reasoning and of money losses. It is not the intention here to discuss methods of sampling, examining, and valuation of gold deposits, but rather to point out some of the pitfalls into which the younger engineer may trip.

It should be noticed that:

1. Gold occurs free, in association with other metals and minerals, and as alloys.

*Mining Engineer, Traders Bank Building, Toronto, Ont.

2. It is found almost invariably in shoots "pitching" in the ore body.

3. Gold is usually irregularly distributed in the pay shoot.

4. Values exist frequently beyond the limits of the pay shoot.

5. There is a very small weight of metal per ton of gangue material.

6. Free gold in an ore shoot is usually found in crevices, cracks, vugs—in crushed and fractured parts of the vein matter—in association with other minerals softer than the gangue—in aggregations, bunches, flakes, etc., irregularly distributed in the rock matter of the vein or deposit. It is sometimes discovered in the wall rock in releases, gouges, etc.

Frequently parts of the vein within the ore shoot are wholly barren. In replacement deposits, as altered limestones, great irregularity of gold deposition occurs and barren material in the limits of the ore shoot are of common occurrence.

"Horses" of barren material often cut into the vein or ore body; in many instances within the pay shoot itself.

7. Gold values, in many types of ore deposits, present a banded structure, the gold being found in parallel or irregular lines with barren or low grade material between the higher grade bands.

8. Some types present definite but narrow streaks of pay-ore with irregular direction within a low grade or barren gangue material.

The above factors are the principal reasons why sampling and investigation of gold-bearing deposits differ substantially from those of most other metals. It will readily be seen that should conditions such as the above obtain, inexperienced sampling must of necessity be absolutely worthless. An assay from any portion of a gold vein is only representative of the sample taken. The sample and not the assay is the determining factor.

It may be said that a free gold condition with sulphides, for proper appraisement requires samples cut under an engineer's direction, which means due regard in cutting for all the eight factors stated above and such minor considerations as will present themselves to the valuer making the appraisement.

The closer the sampling and checking such as additional time and expense will permit, the more reliable will be the conclusion. The fire assay results should be invariably checked by the pan. It may be almost needless to observe that exact valuation of gold deposits depends largely on frequency of sampling and the methods employed. Generally a difference up to fifty cents per ton is a close check on ore under six dollars per ton between different engineers on average conditions; and up to one dollar per ton on ore of ten dollars per ton up to twenty dollars per ton. Under one dollar per ton with ten dollar or twenty dollar ore is usually regarded as a trace in mine sampling.

The accuracy of sampling in mine work in ores from ten dollars to twenty dollars per ton as a general rule need not be calculated closer than the above-named margin between different engineers. The whole of the sampling should be properly mapped and calculated on the widths taken. The usual methods of calculation are followed.

A departure at this point is usually made by experienced gold engineers. Notwithstanding the care taken in sampling, free gold makes for irregular results and the engineer is frequently called upon to give the milling average of the deposit under observation. A deduction after calculation is made for this and the result obtained should show what the ore can be depended on to mill; that is, to return to the mine owner in bullion. This deduction varies from two and a half per cent. to about twenty per cent., and is determined by the experience of the engineer making the observations. It is possible to eliminate entirely this deduction in developed properties by going to greater expense in sampling.

In sampling and observing prospects local conditions will largely influence the observer, but no final conclusion should be reached on purely surface showings. Sampling should be done on the surface outcrops and stripped showings, but it should be supplemented by samples from pits, trenches, etc., put down under the direction of the examining engineer during the time of his investigations. It is usual to accept the indicated observations of prospects that look favourable only on condition that development work be allowed before substantial payments are made.

The whole of the pioneer work in gold areas should be directed to "following the ore"—stick to the values and develop for further examination and observation. Permanent development work and the laying out of a mine cannot be properly begun until there is something exposed to do it upon. The prospect under working exploration will show conditions that will indicate to the engineer in charge how to lay out future development and what kind of managerial policy to recommend. It is impossible to make a two-day infant walk—a prospect is not a mine—don't kill a possible mine by conducting and managing an encouraging prospect like a proposition of blocked out reserves. A windlass is needed before a Nordberg, and picks and powder are required before a stamp battery. It is important to have a shaft on the ore shoot before a completely stocked warehouse is placed on the claim.

Spend your money on men and dynamite and assay, map and tabulate your results. Then it is known what your proposition is and what it stands for. More money can then be intelligently spent or the shaft can be nailed down.

PORCUPINE GOLDFIELD IN WINTER

(Reginald E. Hore, Houghton, Mich.)

The potentialities of Porcupine being now well recognized, and a good temporary road available, strenuous efforts are being made in preparation for the exploration and development of the gold deposits. Testing work in Tisdale Township during the past year has proven two large ore bodies, for the mining and milling of which there is machinery now on the road. Surface prospecting has disclosed some very promising deposits, which are now being explored, and a very large number of less promising or less favourably situated deposits which are being investigated in varied degree according to the supply of faith and funds. Notable efforts are being made by merchants who wish to participate in the business arising from the mining activity. Others have been

The tented City west of the Shuniah, Porcupine

attracted by the opportunity for speculation in claims and town lots; but there has been no remarkable boom.

On the sleigh road from the railroad to the camp over 200 teams are engaged in hauling in supplies. The lack of good summer roads, followed by two or three weeks of isolation during the freeze up, left the camp in the fall with a meagre supply of foodstuffs. During the last week of November a winter road became available, and the immediate needs were soon served. Then followed hundreds of sleigh loads of building materials, part of it for the mines; but much also for the housing of mercantile enterprises on the numerous townsites. Then in January began more frequent shipments of mining machinery. Building materials, food and machinery will be hauled in in large quantities during the next few weeks, and then in March and early April the camp will be stocked with food sufficient to last until the arrival of the railroad in midsummer.

Kelso Mines.

As a result of the activity on the trail, a temporary town has sprung into existence at mileage 222, and has been officially designated Kelso Mines. The T. & N. O. Ry. has provided good yard facilities for handling the incoming freight., and has erected a suitable station house in place of the old day coaches which served in the summer. Besides numerous buildings for the accommodation of men and horses there is, facing the railway, a long line of shops. Once the branch line into Porcupine is completed the yards will be usually well filled with cars, but there are at present sufficient teams to handle 200 tons per day, and the road should be good until the end of March at least. The freight charges vary according to the demands, but 60c. per cwt. is quite frequently quoted. The larger consignments are being handled on contract.

To take care of the large quantity of supplies and machinery ordered for the Dome Mines, the management has a private siding with office and warehouse. Other large interests also have special facilities, and there is, consequently, little confusion in the yard.

The Sleigh Road.

There is a remarkable contrast between the summer and winter roads to Porcupine, the former exceedingly bad and the latter unusually good. It is doubtful whether there could be found in Ontario a 30-mile road better suited for the hauling of freight than is the sleigh road to the gold mines. It is more nearly level than most roads of equal length, is remarkably well protected by thick forest, and on account of the low temperature presents an unusually hard and firm surface. Heavy loads are, consequently, readily handled, and the average drawn by single teams must be nearly three tons. An ordinary load of rough lumber contains 2,500 to 3,000 feet.

From Kelso the stages follow the wagon road to Frederick House Lake, then go along the shore to the mouth of the Frederick House River. The river is then

Noonday scene at Price's Stopping Place.

The Shuniah Hotel, Porcupine.

pine is constructed there will be little reason for the existence of Kelso, and most of the buildings have evidently been erected with this in view.

It seems likely that the large volume of freight will be handled without great difficulty. The yards are followed for a few hundred yards to Richardson's stopping place. Here there is a bridge leading across to a winter road recently cut to Hill's Landing on the Porcupine River, and making a remarkably pretty driveway through close snow-covered spruce and cedar. Four miles from Richardson's is Price's halfway house, and here a stop is made to rest and feed the horses, giving the passengers an opportunity to partake of a meal and warm their toes and noses. The journey is then resumed, and the Porcupine River is crossed at Hill's. Then the narrow, high-crowned, deep-ditched summer road is followed to Golden City and Porcupine Lake. South Porcupine is reached by crossing on the lake, and thence there are good roads to several of the leading properties. One leads west to the Hollinger, Rea and Vipond, and a second southwest to the Dome and Foster.

The stage trip is under ordinary conditions quite a pleasant one, and rarely a severe one if made in daylight. Since many of the travellers reach Kelso in the evening, it is the custom to send stages over the road during the night. Travelling in the dark gives the advantage of a road free from teams; but, especially along Frederick House Lake, has led to undesirable experiences on cold and stormy nights. It is unfortunate that the lake shore has been used rather than do a little additional cutting through the wind-defying forest, and it is remarkable that no marks have been set to guide the teamsters.

While most of the freight travels over the same road as the stages, there is a second road from Kelso to Hill's. This runs past the Kelso nickel mine and avoids the lake; but for various reasons has not been used so extensively as the route described above.

Most of the sleigh roads end in Tisdale Township, and supplies for outlying properties are taken in on toboggans. Off the trails, travelling without snowshoes is practically impossible. To draw the toboggans, dogs are much used, though the prospector is frequently himself the beast of burden. The sleigh dogs are of very numerous types, and mostly mongrels; but there are few of the hybrids such as are used in the far north. An occasional Labrador wolf dog may be seen, but it is the exception rather than the rule.

Mail and Telephone Service.

Porcupine has at last been given a daily mail service, and the summer's second-class mail was taken in in time for Christmas. It is hoped that adequate post office facilities will soon be established, though there is no remarkable haste to this end manifest. A telephone company has connected the mines and town with the outside world, and proposes to establish telegraphic connections at an early date.

Townsite.

Of townsites at Porcupine, there are seven or eight and much speculation and confusion has naturally resulted. Some of these are evidently better than others but none are remarkably favourable. The lake shore does not present a good natural townsite of any great extent, since for the most part the land is low and the water shallow. Drainage and water supply will be serious problems for a town of any size on any of the present lake shore sites. Under the circumstances, the location of the railroad will probably determine that of the town. Well informed persons have remarked on the superior conditions at Mattagami River, a few miles west of the Hollinger Mine, and though perhaps too far distant from the present centre of mining activity

On the Winter Road.

A scene at Kelso Mines, at right is road to Porcupine.

Hollinger Stamp Mill, Porcupine.

to be as yet seriously considered, the natural advantages on the river will doubtless be generally recognized later. Certainly the railroad should be extended thus far.

On the various townsites, numerous buildings are being erected. Among these are two hotels, and as the Shuniah is being enlarged, there should soon be good accommodations for visitors. Very conspicuous are the numerous banking offices, making plain the desire of these institutions to get a foothold in Ontario's gold camp.

The Government Railway.

After private interests had, after much delay, begun the construction of a railroad into the camp, the Ontario Government announced that the Province would build the road. From a point two miles above Kelso the work is now being carried on. Several miles of the line has been cleared of forest, and some grading, which is very light, has been done. The exact location has not yet been made public; but the line will evidently cross the Kelso wagon road twice before Frederick House Lake is reached, and probably pass near Price's stopping place. It is expected to touch at the north end of Porcupine Lake, and then run down the west shore to South Porcupine, and thence to the Dome Mine. Probably later an extension will be made westward to Pearl Lake and the Mattagami River. The appropriation of $450,000 for the building of the road allows about $15,000 per mile. It is expected that there will be steel to Porcupine Lake by July.

Development.

Owing to the deep covering of snow, surface prospecting in winter is in most cases unsatisfactory. Few new finds are made, and of the nature of these little is determined before the snow melts. Some surface work is being done, however, including the stripping of finds made during the past summer, and the trenching of some well located ground which was too wet to work in the fall. It was found that in some such places water filled the trenches almost as quickly as the clay was removed, and hence it is an advantage to have the ground frozen. The removal of a few feet of snow is a small item when the trenches are of any considerable depth.

Freight on Siding at Kelso Mines.

On a number of properties which have good surface showings, preparations for development work are now in progress, camps are being built, and supplies and machinery assembled. On two properties, Dome and Hollinger, development work has already been carried on to such an extent and with such satisfactory results, that preparations for mining and milling ore on a large scale are under way. The quartz mass at the Dome Mine has been blocked out by drifts and cross-cuts run at regular intervals on the 60-foot level, while the surface has been carefully sampled. The several drill holes proved the deposit to a depth of 400 feet, showing the ore body to be very large and giving a more definite idea of its shape. No tests have yet been made at greater depth, and exploration work is now postponed, while the permanent hoisting shaft is being sunk. The exploration shafts will probably be used in blasting down the ore by underhand stoping, while all hoisting will be done at the new shaft. That the cost of mining will be low is evident. The cost of milling has yet to be determined, as some of the conditions are not remarkably favourable. To reduce the ore, a 40 or 50-stamp mill, and a complete recrushing and cyanide plant will be erected in the spring. It is planned to handle about 250 tons per day.

On the Kelso Road.

On the Timmins-McMartin-Dunlap properties, the chief development is on the claims held by Hollinger Gold mine. On one large vein two shafts, 250 paces apart, have been connected at the 100-foot level by a tortuous drift following the vein for most of the distance. From the first level a winze has been sunk in the vein, and is said to be in good ore. The 2-stamp test mill handles about 4 or 5 tons per day, with a maximum capacity of 10 tons when the steam pressure is good and favourable ore is being fed. The quartz crushes readily; but the schistose carbonate wall rock is more troublesome. One of the owners is quoted as stating that the 300 tons of ore first treated in the mill averaged $50.00 to $250.00 per ton. Only a small fraction of the ore mined in development work has been milled. A 30-stamp mill, to crush Hollinger ore and take custom work, has been ordered by the Timmins syndicate, and will be erected in the spring. It is apparently not the intention to put in a cyanide plant immediately, as there is considerable quartz that is reasonably free from sulphides. It will evidently be possible to keep the stamps busy crushing for some time before feeding much of the pyritic country rock.

This property has been incorporated as the Hollinger Gold Mine, and shares representing a minority interest were recently placed on the market. The control lies still with the quintette who developed the La Rose Mine.

Aside from the Hollinger claims, the Timmins syndicate has done some development work on promising veins on the Miller-Middleton claims. If these veins prove as satisfactory as the surface showings indicate, there should soon be another producing mine in the camp.

At the Vipond property of the Porcupine Gold Mines Company, there have been two stamps put into commission recently, and there are, consequently, now three Porcupine properties which are producing gold while exploring the ore bodies.

At a number of other properties, including the Rea (Consolidated Goldfields), Foster, and Armstrong-McGibbon (Tisdale Mines), exploration shafts are being sunk in ore, and much information as to the nature of the deposits should be gained in the next few months.

Spring should show the camp to be well stocked with supplies, power from Mattagami River available, and steel being laid. Important developments during the year are therefore to be expected.

WORK OF THE GEOLOGICAL SURVEY IN 1910

(Written for the Canadian Mining Journal.)

The geological and topographical field work undertaken by the Geological Survey during the past season has, as usual, been economic in its bearing, most of it directly so; but a little has been on the broader problems of Canadian geology whose solution is required for the interpretation of the facts gleaned in the detailed examination of the mining districts. Most of the fields selected are those in which work has been specially asked for by the mining profession, Boards of Trade, etc. Not all such requests received could be met, on account of the lack of specially qualified men to take charge of the operations. So far as possible, however, this was done. The guiding principle in the selection was to choose those districts in which the work would be likely to prove of most immediate or of greatest value. The parties were distributed as follows:

Mr. D. D. Cairnes was engaged in investigating the ore deposits of the Atlin District. This district has for a decade been known as a placer field. During the past season some promising developments in lode mining have taken place.

Mr. R. G. McConnell spent the season studying the geology and ore deposits of the Stewart district at the head of Portland Canal. This district attracted a great deal of attention during the summer. While promising deposits have been found, exaggerated reports sent out threatened a wild boom, which, fortunately, the Survey was able to assist in preventing by the publication of official despatches from its representative in this field.

Mr. G. Malloch made a topographical survey of this district.

Mr. W. W. Leach continued his topographical and geological mapping of the Hazelton district. The approach of the Grand Trunk Pacific Railway brings this section into prominence. Promising discoveries of silver-lead, copper and coal have been made.

Mr. R. H. Chapman, assisted by Messrs. Chipman, McLean, MacKay, McElhanney and Wookey continued the topographical mapping of Vancouver Island. Mr. McLean continued the triangulation of the island as control of the topographic maps. Mr. Chapman divided his forces into three parties and completed the mapping of three more sheets.

Mr. C. H. Clapp made a detailed examination of the area of the Victoria and Saanich sheets, which were topographically mapped the previous season by Mr. Chapman. Vancouver Island is now attracting many settlers and the topographical and geological mapping of the island is of great and immediate value.

Mr. C. H. Camsell completed his topographical and geological survey of the Tulameen district and made a reconnaissance from the international boundary line to the Nicola Valley. This section is noted for the variety of its minerals, and prospect of railway transportation is bringing it into notice.

Mr. L. Reinecke completed his topographical mapping of the Beaverdell mining district, West Fork of the Kettle River, and began a study of its geology and ore deposits.

Mr. W. H. Boyd made a topographical survey of the Deadwood Mining Camp and continued his survey of the Slocan district.

Mr. Mr. O. E. LeRoy made a study of the geology and ore deposits of Deadwood, completed his investigation of the ore deposits of the Slocan silver-lead district, and made a preliminary examination of Franklin camp, North Fork of the Kettle River.

Mr. S. J. Schofield continued his topographical and geological survey of East Kootenay.

For the correlation of the formations met with in the mining camps and for the deciphering of their complicated geological structure several detailed geological sections across the Cordillera in Canada are required. Such a section has been constructed by Mr. R. A. Daly along the international boundary line. A similar section is now needed along the main line of the Canadian Pacific Railway. Work upon this was commenced this season. Mr. J. A. Allan was at work in the vicinity of Ice River. Mr. H. S. Shimer studied in detail the Devon Carboniferous rocks near Field. The Cambrian rocks near Field have been made the subject of careful study for several seasons by Dr. C. H. Walcott, Secretary of the Smithsonian Institution, Washington. Incidentally it may be mentioned that Dr. Walcott found here one of the most remarkable deposits of fossils ever discovered.

Mr. D. B. Dowling continued his explorations of the coal-bearing rocks on the east slope of the Rockies. This year he was delimiting the coal formations in the neighbourhood of the Yellowhead Pass. Being right on the Grand Trunk Pacific Railway these fields are of special importance.

With the settlement of the country the demand for clays suitable for all kinds of clay products becomes urgent. If found, important industries are developed. Unless found, a serious burden is imposed upon the communities. Mr. Heinrich Ries, the most prominent clay expert in America, and Mr. Joseph Keele, spent the season investigating the clay resources of the Western Provinces.

Mr. W. McInnes mapped and more accurately defined the geological boundaries in the district north of Cum-

berland House and the Pass, work which is at present desirable in anticipation of the early construction of the Hudson Bay Railway.

Mr. J. D. Trueman spent the season in the Gunflint Lake district, Western Ontario. This area has never been mapped geologically. On account of its proximity to known iron districts its examination was called for.

Mr. W. H. Collins completed his geological map of the Gowganda district, and commenced the mapping of the unsurveyed but promising district west of the Temiskaming sheet and north of the Sudbury sheet.

Mr. W. A. Johnston continued his topographical and geological surveys in the Lake Simcoe district.

Mr. C. R. Stauffer began a re-survey of the geology of Southwestern Ontario, in which important non-metallic mineral deposits occur. No detailed study of its geology has been made since the early days of the survey, the reports and maps of which are long since out of print. r es. wells, borings, etc., have brought to light much additional information, so that a revision of the geology of this district will be welcomed.

Mr. Morley E. Wilson was engaged in mapping and examining the district east of Abitibi Lake. This district is similar to Northern Ontario, and it is hoped that similar mineral discoveries may be made in it.

Mr. J. A. Dresser continued his investigations in the Eastern Townships of Quebec, noted for their great and varied mineral wealth.

Mr. J. W. Goldthwait studied the raised marine beaches south of the St. Lawrence River. This work has a bearing on the clays, sands and soils of the region. The elevation of the land relative to the gulf has been comparatively recent; it is important to ascertain if it has been uniform or greater at one point than another and also, if possible, whether the uplift is still in progress.

Dr. G. A. Young made a geological and topographical survey of the Tobique district, New Brunswick. For some years this field has been brought to the attention of the Survey, there being a strong feeling in New Brunswick that it may prove to be possessed of mineral wealth.

Mr. M. Y. Williams made a detailed study of the district about Arisaig, N.S. This presents probably the best section of Silurian rocks in Eastern America, and their detailed study here may provide a key to their investigation elsewhere.

Mr. E. R. Faribault continued his mapping of Nova Scotia and his investigation of the gold tungsten-bearing rocks. Leaving his party at work in the field, Mr. Faribault spent the two summer months in the Chibougamou district, Quebec, as one of the Commissioners appointed by the Quebec Government to report on the geology and mineral resources of the Chibougamou Lake district, his services having been loaned by the Survey to the Quebec Government for this purpose.

Mr. W. J. Wilson spent a few weeks in the Maritime Provinces collecting fossils to aid in fixing geological horizons, and Mr. P. E. Raymond collected in the neighbourhood of Ottawa, with a similar object.

The Director visited Porcupine, Ontario; accompanied His Excellency Earl Grey on his Hudson Bay expedition; represented Canada at a meeting of the American Mining Congress at Los Angeles, Cal., where he was called upon on several occasions to address audiences on the mining possibilities in Canada; he also made an examination of Turtle Mountain, at Frank, Alta.

No detailed work was done by the Survey in Porcupine, as this district was receiving attention at the hands of the Provincial Bureau of Mines. By mutual arrangement, duplication of work is avoided.

At the instance of the Geological Survey, the Government of Canada and the Canadian Mining Institute, invited the International Geological Congress to hold its next meeting in Canada. This invitation has been accepted and in 1913 about one thousand of the leading geologists, representing every civilized country, will visit Canada and study the geology and mineral resources of this country.

Topographical Division.

During the past year considerable progress has been made in the organization of the topographical division. To this the generous assistance of the United States Geological Survey, afforded through Mr. R. H. Chapman, contributed in no small degree. A corps of carefully selected topographers is being trained, and our standard topographical maps, now being made, will compare favourably with those produced anywhere. Perhaps no part of the work of the Geological Survey is of more immediate economic value; for not only are these accurate topographical maps necessary as base maps for the detailed geology of mining camps to make it sufficiently exact for economic purposes, but these topographic maps are in themselves very valuable to the mining companies, as they may be used for many of the engineering problems which are constantly arising, thereby saving large sums to the operators. This saving represents just so much more capital that is available for developing and other directly productive uses.

A significant tribute to the character of the work now being done is afforded by a British army officer who, after visiting one of our parties in the field last summer, decided to send his son to Canada to receive his training in a Canadian university and on a geological survey topographical party.

In addition to geological work, the Geological Survey is called upon by the Department of Mines Act to engage upon work in natural history, anthropology, etc.

Natural History.

Mr. John Macoun spent the field season in Nova Scotia collecting information and illustrative material on the botany of the Province. He also supervised the work of Mr. C. H. Young, who was collecting marine fauna on the Nova Scotia coast.

Mr. James Macoun went to the north-west coast of Hudson Bay to collect the flora and fauna of that district.

Anthropology.

While the Survey has done some important work in anthropology in the past, it has been spasmodic and entirely secondary. With the rapid settlement of the country, the time has come when work along this line must be vigorously prosecuted, for settlement destroys the materials, and unless they are collected and preserved now, they will be lost forever, and the succeeding generations of Canadians will search in vain for authentic information concerning the native races of their country.

Since this work is called for in the organic law of the Department and the time was opportune, a Division of Anthropology was established this year, and Dr. Edward Sapir was appointed to take charge of it.

Mr. Sapir spent the field season in the West, more particularly in the neighbourhood of Alberni, Vancouver Island, studying the Indians of this section.

Mr. V. Stefansson, who is in the Arctic under the auspices of the American Museum of Natural His-

tory, continued his study of the life and habits of the Esquimo east of the Mackenzie River. He had a trying winter, on account of the failure of the hunt, but managed to pull through. The present winter he expected to spend near Coronation Gulf.

Publications.

The results of the investigations of the Survey are given to the public in the form of maps and reports. Since, however, a great many different classes and individuals find the work of the Survey of interest and value for very different purposes, it is impossible in a general report to present the matter in other ways and in the detail that might be desirable for any single class or individual. A great deal of information is acquired that may be of value to certain individuals but not to the general public, hence must be omitted in a report. Much of such information is given to individuals in the field, and this is perhaps the most practical work the Survey does. A great deal is supplied by correspondence. This branch of the Survey's work is growing rapidly. To avoid delay, information that is of immediate interest to the public is furnished through Press Bulletins, which are sent to the press throughout Canada and also to those individuals who have expressed a wish to have their names placed on the "Notice list" of the Survey. Timely information concerning the Porcupine gold district, the Stewart district, Portland Canal, the Atlin district, Hazelton district, etc., was made public in this manner.

Educational Work.

By a little extra effort and at a comparatively small expenditure, the Survey is able to assist materially the educational institutions of the country. Reports and maps that may be of use in the higher grade schools and colleges are supplied free of cost. To institutions of at least High School grade, attractive cabinets of typical Canadian rocks, minerals, and ores are also furnished free. Positions as student assistants on field parties are reserved for college graduates or students who have at least finished their second year, and who are specializing in geology, mining or topography. The experience gained in the field supplements the college work and is of great direct educational value.

Victoria Memorial Museum.

For many years both the museum halls and storage accommodation in the old building have been taxed to their utmost capacity and as a natural result little has been possible in the way of making new acquisitions. During the past year, however, some important collections were obtained and preparations made for moving the collections to the new Victoria Memorial Museum. Although the building was not completed but still in the contractor's hands, moving was begun in November and at the close of the year the greater part of the offices and collections had been placed in the new building, where the valuable material will no longer be in danger of destruction from fire. On account of lack of accommodation in the old building, not only was the museum stifled, but the general work of the Survey was seriously handicapped. These disabilities are removed in the new quarters. The museums can now expand and the work of the Survey be accelerated. The museums will include mineralogy and geology, biology, and anthropology. In the old museum mineralogy and geology were dominant, the other divisions being only sparingly represented. It is the intention to increase the economic material in the mineralogy and geology division so that Canadian ores and their products, their mode of occurrence, etc., may be thoroughly represented, and to greatly strengthen the biological and anthropological divisions. A large amount of material suitable for public display is already on hand, which for lack of room could not be placed in the old exhibition halls. For the present it is the intention to restrict the museum to Canadian material (except in educational collections where necessary objects may be lacking in Canada) in order to make it first of all the great Canadian museum, whose collections in Canadian material will surpass all others. When this has been accomplished in all divisions, it may be advisable to enlarge its scope, and make it a world museum. It is proposed to take some space for scientific collections. As a National Museum it will be the repository of all Canadian objects of scientific value. Most of such material is of no interest to the general public and should, therefore, not take up valuable space and costly cases in the exhibition halls, but they should be arranged and catalogued and be accessible to Canadian students and scientists from abroad who may wish to study Canadian material. It will be some time before the exhibition halls can be made ready for the public. The old furnishings are unsuitable, and new modern cases will be provided. The specimens for public display will each have to be selected, labelled, and placed in position. This involves an immense amount of labour that has to be done personally by the officials in charge and cannot be relegated to temporary helpers. On account of lack of space in the old building, little could be done in this direction. Now that the material is in the new building this work will be pushed.

REPORT OF THE COUNCIL OF THE CANADIAN MINING INSTITUTE FOR THE YEAR 1910.

In reviewing the activities of the Institute for the year ending December 31st, 1910, the Council takes the opportunity of congratulating the members on the present satisfactory condition of the affairs of the Society; on the expansion of its scope of influence and usefulness; the well maintained increase in its membership, and the manifest improvement in the value of its publications. The interest displayed in the meetings is strongly evinced by the statement that the registration at the annual general meeting in Toronto in March showed an attendance of over two hundred and thirty members and guests; or a representation of about thirty per cent. of the total membership. Considering the vast area over which the membership is scattered, so considerable an attendance is remarkable, and in the highest degree gratifying. The meeting of the western branch in Vancouver in February last was also well attended, and the papers read stimulated discussion of an exceptionally valuable character. A largely attended meeting of the Cobalt Branch was held in July at which Prof. Robt. H. Richards, the distinguished authority on ore-dressing, delivered a lecture on the

subject, having special reference to the conditions obtaining in the Cobalt district.

The special contributors to the Transactions this year, and to whom thanks are due, include Prof. Richards, for his comprehensive paper on "The Development of Hindered Settling Apparatus"; Dr. F. L. Ransome, Mr. B. B. Lawrence, Dr. James Douglas, and Dr. Heinrich Ries. It should also be noted that Dr. J. D. Irving delivered an exhaustive address on the subject of "Replacement Deposits," at the annual meeting, but by reason of other pressing duties has not found leisure in the interim to transcribe his notes for publication. It is hoped, however, that this contribution in printed form will be available to members in the near future.

In view of the considerably augmented cost of publishing the Transactions, partly ascribable to the increased bulk of the annual volume of Transactions, to the publication of a quarterly bulletin, and also to the general advance in prices charged for printing, the Council, recognizing that retrenchment in some direction was necessary, decided to discontinue the practice of binding the annual volume of Transactions in half-leather. In future, therefore, the volumes will be issued in paper covers. Provision is made, however, that members desiring it shall receive the volume in half-leather binding upon payment of one dollar per annum in addition to the regular membership subscription.

Unquestionably the most important work undertaken by the Institute during the year has been the endeavour to induce the Dominion Government to act on the recommendation of the Select Standing Committee of the House of Commons on Mines and Mining. These recommendations were (1) that there be assigned to the Mining Department the administration of mines, including the issue of title thereto, and of all mining laws; and (2) that an Act be passed consolidating all the laws relating to mines under Federal control.

Immediately after the annual meeting the Council appointed a committee under the chairmanship of Mr. G. G. S. Lindsey, to represent the Institute, and to take such steps as might be expedient to properly impress on the Government the need for early and prompt action along the lines indicated. The committee, therefore, proceeded to Ottawa, on Monday, March 21st, and waited on the Premier, to whom the issues were fully submitted, special stress being laid on the importance of providing that prevision of issue of title to mining lands controlled by the Federal Government, be fixed by Statute enactment, instead of by regulations subject to arbitrary and frequent change by orders-in-council. The committee also pointed out that the present opportunity was favourable to the framing of a mining law for the Dominion that would be so just and right in principle as to recommend itself for universal adoption in Canada, and expressed the hope that the introduction of such a bill would be the first step towards the accomplishment of this uniformity, which was very much desired by those interested in the development of our mining resources. The Premier's reception of the committee's views was entirely courteous and friendly, and before the close of the conference he gave a definite assurance that a transference of the administration of mining lands from the Department of the Interior to the Department of Mines would be made, and added the suggestion that the Canadian Mining Institute undertake the drafting of a mining law which could be introduced to and considered by Parliament at the next session. The committee consulted with the Hon. Wm. Templeman, Minister of Mines, and with members of the Parliamentary Committee on Mines on this point. No definite action was taken by the Government until Wednesday, December 14th, when the committee, having drafted certain recommendations, embodying what in their judgment should be adopted as the basis of a mining law, again went before the Parliamentary Committee to urge immediate action. These recommendations, which had previously been endorsed by the Council of the Institute, are as follows:

(1) That the title to be required should be leased for ninety years for all purposes.

(2) That the rental should be based upon the acreage and paid in advance at the rate of one dollar per acre per annum. Work done on any claim to the extent of the rental, but only where work alone amounts to at least $200 in any one year, is to be received in lieu of rental for that year.

(3) That, in addition, royalties at the rates at present provided, be paid (it to be made clear what the general clause in regard to royalties in the existing statute means).

In the case of coal, the present royalty, five cents per ton (2,000 pounds) should prevail up to the year 1930 (this date is given because the existing 21 years' leases based on the five cent royalty expire at that time), and after 1930, and up to the end of the present century the royalty should be ten cents per ton.

Note.—Existing lessees should be permitted to exchange for leases under the new statute.

(4) The prospector shall not be obliged to make discovery of mineral in place to the satisfaction of anyone, but having made what by him is believed to be a discovery of mineral in place, he is to be permitted to stake out a claim and then record it in the Government recording office at a nominal fee, on doing which a lease it to be issued to him, which lease is to be perfectly free from any condition dependent on the opinion or reports of officials.

(5) A license fee shall be required of persons applying for the lease of mining lands from the Crown, and a prospector must either obtain a license to prospect before going into the field, or qualify in this respect before recording a claim.

The argument in favour of the adoption of the leasehold system of mining land tenure was strongly presented to the Parliamentary Committee by Mr. Lindsey, and this as well as the other recommendations put forward were approved. The Minister of Mines having pointed out that under existing conditions the question arose whether the Minister of the Interior or of Mines should be responsible for the preparation of the Bill, the point at issue was referred to the Premier, who decided that the responsibility rested with the Minister of Mines. In consequence, Mr. Templeman immediately instructed Mr. J. M. Clark, K.C., of Toronto, to draft a Bill on the lines suggested by Mr. Lindsey's committee.

The Council consider that the committee is to be heartily congratulated on its success in advancing the business with which it was entrusted to the present stage, and confidently anticipate that as a direct result of the committee's exertion, a mining law which will be highly acceptable to the mining community, will, in the near future, be placed on the statutes of the Dominion.

It is also satisfactory to record that two resolutions adopted by the western branch, one advocating the removal of Customs duty from rescue apparatus for use in coal mines, and the other the establishment of telegraphic communication with the Portland Canal district, have been acted on by the Federal Government.

Two important international meetings took place dur-

ing the year in Europe, namely, that of the International Geological Congress in Sweden, and the International Mining Congress at Dusseldorf, Germany. The Institute was represented at the former by the President, Dr. Frank D. Adams, of Montreal, who was appointed one of the vice-presidents at the Congress, and contributed several valuable papers, dealing with Canadian geological conditions, to the proceedings. The President, on behalf of the Institute, also invited the Congress to hold their next meeting in Canada, and this invitation, which was made conjointly by the Dominion Government and the Canadian Mining Institute, having been accepted, the meeting will be held in Canada during the summer of 1913. The Council takes this opportunity of bespeaking the interest and co-operation of the membership in the organization arrangements which have been already initiated.

The meeting of the Congress in Canada, which will be attended by probably a thousand of the most eminent geologists from all parts of the world, will be an event of first-rate importance. Highly beneficial results of both a scientific and practical character may be confidently looked for, and the Council is most desirous that the Institute should not fail to do full justice to the occasion.

The meeting of the International Mining Congress was held at Dusseldorf, Germany, during the last week in June. The Institute was officially represented by the Secretary, who presented a paper on "The Mineral Resources and Industries of Canada," which has been widely circulated. The Secretary also delivered an address, illustrated by lantern slides, on the same subject in England, and several interviews with him were published in the London papers. As a result of a suggestion made to the chief clerk in the office of the High Commissioner for Canada, persons applying to that official for specific information respecting mines and mining in this country, have been advised to communicate with the Institute, and during the past few months numerous enquiries have been received and replies duly sent.

The effect of the by-law adopted at the last annual meeting, providing for the admission of members of the Institution of Mining and Metallurgy to the Institute at a reduced annual subscription, has been to further strengthen the relationship between the two organizations; and at a banquet tendered by the Council of the Institution to members of Council and officials of the Institute in London, in July last, reported in Quarterly Bulletin, C.M.I., No. 12, page, 3, appreciative reference is made by the President of the Institution to this action on the part of the Institute. The desire of the Institution to promote close and friendly relations, is also evinced by the extension of the post-graduate courses under the auspices of the Institution, to Canada, and on the recommendation of a committee of the Council, Mr. R. B. MacKay, a graduate of the School of Mining, Kingston, was awarded one of the Institution's Scholarships last spring, and has since left to follow the prescribed course in South Africa. A proposal to hold a joint meeting of the Institution and the Institute in Canada during the winter of 1911-12 is meanwhile under discussion, and it is hoped that arrangements to that end will shortly be completed.

Meetings.

The twelfth general annual meeting of the Institute was held at the King Edward Hotel, Toronto, on March 2nd, 3rd, and 4th, 1910. As already mentioned, the attendance was the largest yet recorded since the inception of the Institute. Other meetings held during the year were at Vancouver, B.C., on February 25th; at Grand Forks, B.C., on May 26th; at Sherbrooke, Que., on May 27th; at Cobalt, Ont., on July 6th; at Montreal on November 4th, and at Toronto on December 2nd. Five regular and two special meetings of Council have been held during the year.

Publications.

The papers presented at the annual meeting, together with those read at the branch meetings, and also others transmitted direct to the Secretary, in all, 41 papers, two of which were contributed by non-members upon the invitation of the Council, two contributed by corresponding members, thirty-three by members, and four by student members, together with the discussions thereon, are published in Vol. XIII. of the Journal of the Institute, which has been distributed to members in good standing. Four Bulletins, representing 796 pages of printed matter, have also been published and distributed during the year.

Branches.

The meetings at Vancouver and Grand Forks, B.C., held under the auspices of the western branch, were well attended, and interest in this branch is well maintained. At the meeting of the Cobalt branch in July, an attendance of upwards of one hundred members and guests is reported. The feature of the Toronto branch meetings is a fortnightly luncheon, after which matters of general interest as affecting either the mining industry or the Institute are frequently discussed. The Toronto branch has also on several occasions entertained distinguished engineers from abroad at their periodical gatherings. The reorganization of the Sherbrooke branch, established in 1900, is a further matter for congratulation, and has resulted in a considerable increase of membership from the Eastern Townships of the Province of Quebec.

Library.

A special effort has been made to increase the efficiency of the library, and a considerable appropriation was devoted this year to the purchase of new books, book-cases, and to binding. Sets of reports, society transactions, or reference works, from which early numbers were found to be missing, have been completed as far as possible, and in all some 300 volumes have been added to the shelves. An abridged catalogue of the books in the library has been printed in No. 12 of the Bulletin, and members have been advised on what terms they may borrow books, and informed that the Secretary will undertake to make searches, prepare bibliographies, and abstract information on special subjects upon request. Advantage has already been taken of these provisions. Use, to a considerable extent, has also been made of the library and reading room by visitors from abroad.

Secretary's Office.

The following returns are taken from the Secretary's records for the year ending December 31st, 1910:

Letters received	2,039
Letters sent, notices, etc.	5,477
Circulars issued	7,600
Publications issued	6,525

Students' Competition and Awards.

Eight papers were submitted this year by student members in competition for the Institute's annual awards. After receiving the report of the judges, namely, Dr. A. E. Barlow, Mr. J. C. Murray, and the Secretary, the Council awarded the President's Gold Medal to Mr. G. L. Burland, of McGill University, Montreal, for his paper entitled "Longwall Mining and Emery Pit, Dominion No. 10, Reserve, C.B."; while a cash prize

of $50 was equally divided between Mr. A. M. Bateman, of the School of Mining, Kingston, Mr. J. J. McEachern, of the School of Mining, Kingston, and Mr. A. G. Haultain, of McGill University, Montreal. The prize winning papers (with the exception of that by Mr. Burland, which is withheld for the present), as well as a paper contributed by Mr. G. A. Gillies, of McGill University, have been published in Vol. XIII. of the Transactions.

Commans-Frecheville-Marriott Prize.

The prize of two hundred and fifty dollars offered by Messrs. R. E. Commans, William Frecheville, and H. F. Marriott, of London, England, for the best paper dealing with mining or metallurgical progress in Canada between October, 1908, and October, 1909, contributed to the Transactions of the Institute prior to January 1st, 1910, was divided equally between Mr. H. H. Yuill for his paper on "The Hosmer Mines, B.C.," and Mr. Frank B. Lathe, for his paper on "The Granby Smelter."

Membership.

The membership now numbers, inclusive of all classes, nine hundred and seventy-four members.

The accessions during the year were as follows:

Honorary members	1
Corresponding members	2
Ex-officio members	5
Life members	3
Members	71
Associates	22
Students	5
	109

Deaths.

The Council records with profound regret the deaths during the year of the following members:

Members—Grundy, Frank, Sherbrooks, Que.; Hardy, G. D., Cobalt, Ont.; Reed, Dr. James, Reedsdale, Que.; Wiley, H. A., Toronto, Ont.

The resignations of the following members and associates have been accepted:

Members—Anderson, W., Rossland, B.C.; Farquhar, J. B., Vancouver, B.C.; Gamey, R. R., Toronto, Ont.; Hardinge, H. W., New York City, U.S.A.; Harris, J. M., Sandon, B.C.; Kaye, Alex., Vancouver, B.C.; Miller, Spencer, New York City, U.S.A.; Mills, S. D., Toronto, Ont.; Parkhurst, F. S., Niagara Falls, N.Y.; Powell, J. W., Coleman, Alta.; Sands, J. M., Rossland, B.C.; Sharp, B. N., Orient, Wash., U.S.A.; Sproule, G., Montreal, Que.; Stoek, H. H., Scranton, Pa., U.S.A.

Associates—Bowers, A. E., Northport, Wash., U.S.A.; MacKenzie, A. B., Rossland, B.C.; Morrison, G. F., Toronto, Ont.; Pringle, Clive, Ottawa, Ont.; Rugh, W. S., Rossland, B.C.

Students—Carr-Harris, A., Mexico.

The Destruction of a Valuable Water-Power on the Frederick House River, near Porcupine.

(Written for the CANADIAN MINING JOURNAL by C. W. KNIGHT.*)

Father Paradis is reported to have made the statement that the clay belt of northern Ontario should be drained, not dammed, and that the present drainage system might be likened to a man suffering from pneumonia. As to the verity of these assertions the reader must form his own conclusion; but, be that as it may, it is certain that the reverend gentleman must have had some such belief when in the fall of 1909 he lowered the water of Frederick House River by cutting away its embankment beside a falls, thereby destroying a valuable water-power. It is further certain that the prospecting and mining fraternity of that region does not believe, as a general rule, in draining the country, just as it is also certain, on the other hand, that it believes in heartily damning a certain gentleman who shall be nameless. For the lowering of Frederick House River caused a fall of four or five feet in Frederick House Lake, and, since the latter is shallow and flat, navigation by canoe or small gasoline boats became impossible. It would take the softening touch of Bret Harte's pen to put into decent and respectable print the language which floated away from many a belated canoe struggling across the sand-barred lake. But, like other situations, there are two sides to the question, and it may be that future generations of prosaic farmers, long after Porcupine is a dead one, may bless the worthy friar for draining areas of what might otherwise have remained, in part, swamp land.

* Assistant Geologist, Bureau of Mines, Ontario.

Thirteen years ago, Professor W. A. Parks, of Toronto University, examined the river for the Bureau of Mines, and his description of the part under consideration is as follows: "The water of Frederick House Lake passes out at the north end by a river of the same name. It is two or three chains wide at the head, with an easy current. About a mile and a half down, it bifurcates around an island forty chains in length and

Fig. 2. Fault in clay on Banks of Frederick House River.

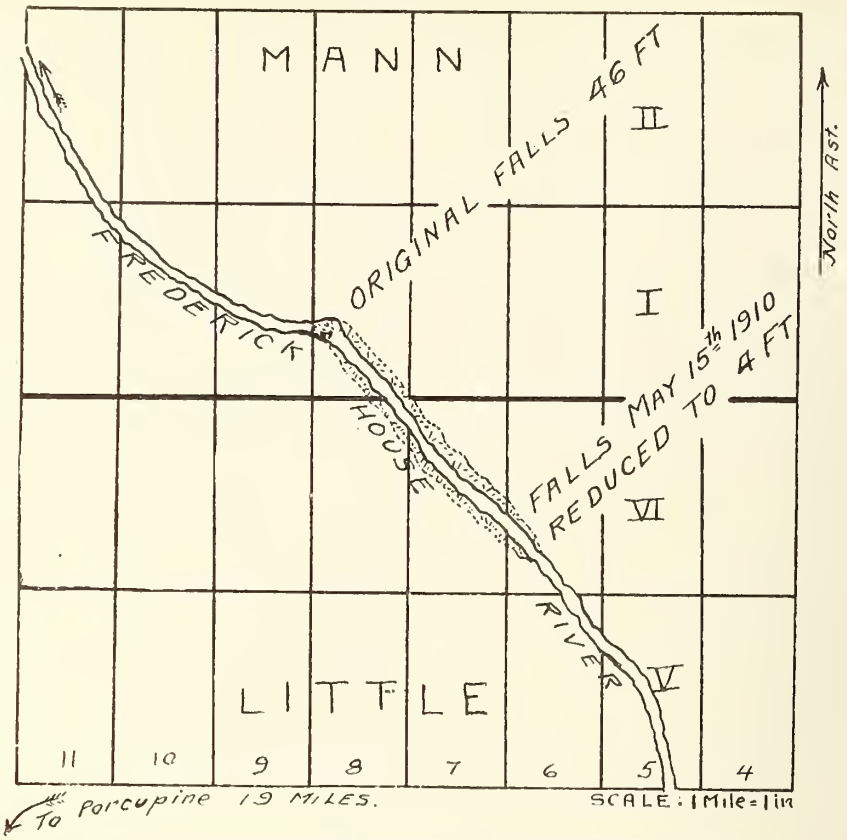

Fig. 1. Plan showing original position of Falls on Frederick House River.

continues a little west of north to the first falls, about seven miles down. A barrier of rock crosses here, N. 10 degrees E., causing a succession of cascades with a total descent of 46 feet. An island divides the river, and, in all, it may be said that there are three tiers of three cascades each, with a total width of five chains. A rather steep portage of three chains on the east enables us to pass the obstruction."

During the summer of 1910 Porcupine was the lodestone that attracted prospectors, and there were few who went out of their way for the purpose of visiting the scene of Father Paradis' operations on the Frederick House River. Early in May of last year the writer accompanied Dr. Willet G. Miller on his trip into Porcupine, but, before reaching the gold camp, a few days were spent in examining the effects which the lowering of the water had on the banks and bed of the river.

Originally the Frederick House River, at a point eight or nine miles below the lake of the same name, poured its waters over a rocky cliff fifty-six feet high. On the eastern bank, just above the falls, Father Paradis dug a trench in the soft clay and sand. It so happens that the rocky floor on which this clay rests dips steeply, almost vertically, in an easterly direction, and consequently the clay had here a thickness of about fifty feet. Part of the water thus diverted into a new channel began to deepen it, and before long the whole river was rapidly carving a gorge in the soft clay, abandoning its original bed on the solid rock. Father Paradis, in discussing the matter afterwards, said he introduced the

Fig. 3. Three successive faults in clay on banks of Frederick House River.

Fig. 4. Showing the results of lowering the water on Frederick House River.

principle and the river drew the conclusion. The trench which he dug was a comparatively shallow one. By May of the following spring the falls had cut their way up the river a distance of about one and a half miles, leaving in their wake a path of devastation.

As the old channel was deepened the clay banks gradually caved in, caused by a series of faults illustrated in two of the accompanying photographs. The faulted blocks of clay were sometimes hundreds of square feet in area, and, as the upper parts of the banks were covered with a dense foliage of birch, poplar, spruce and other trees, these were carried down with the soil on which they grew, and either cast into the torrent below or strewn up and down the new banks in the wildest confusion. Many of them were snapped in two like twigs and now lie crossed in all directions. In places whole masses of earth the width of a street have been

Fig 5. Showing the results of lowering the water on Frederick House River

dropped down bodily without disturbing the trees or vegetation growing on them, so that, if a man had been standing on one of these masses, he would probably have received no injury other than a severe jolt But, for the most part, the moss, trees, and surface soil have been disturbed and deeply buried under the heavy clay deposits. Originally the banks had a height of about thirty feet, and the channel a width of 200 feet. But, as a result of the landslides, the distance between the top of the banks has been increased in places to 800 feet, while the width of the water is only about 100 feet, the river having become a swift, impassable torrent.

The sections revealed in the new gorge show the clay to be partly stratified and to be in part without stratification, the latter facies containing a few pebbles or boulders. It was pointed out by Dr. Miller that the river in cutting its way back formed two or more horseshoe falls, suggestive of Niagara on a small scale. Each horseshoe was then slowly deepened, until finally the intervening walls became thin, collapsed, and were washed away, thus forming a single horseshoe, which again divided into others. So the process was continued.

It is interesting to speculate on what will be the course of events in future years as the river continues to cut back and deepen its old channel. Provided it meets with no obstruction in the form of solid rock, it is probable that Frederick House Lake may eventually disappear, seeing that it has a shallow, flat bottom. In that case the river would find a channel somewhere in the bed of the lake. However, there is at least one outcrop of rock half way between the present falls and the lake. If this barrier is large enough, it may arrest the progress of erosion, and a new falls would then be formed at this point, gradually increasing in height as the channel below was deepened in the soft clay.

Mineral Output of Russia.

The following report on the mineral output of Russia is made by John H. Snodgrass, United States consul general at Moscow:

Statistics recently issued by the government show that the gold production of Russia in 1909 amounted to 1,284,912 ounces, an increase of 171,696 ounces over 1908; platinum, 134,784 ounces, an increase of 6,000 ounces; copper, 40,572,000 pounds, an increase of 3,636,000 pounds.

During the first seven months of 1910 the output of copper was 29,664,000 pounds, compared with 21,744,000 pounds for the corresponding period of 1909, an increase of 7,920,000 pounds. The imports of copper into the empire consist principally of electrolytic copper, which is now produced at only two Russian works, but the production of which is making gradual progress. In 1901 Russia imported 29,520,000 pounds of copper; in 1907, 9,792,000 pounds, and in 1909, only 7,668,000 pounds.

The production of iron also shows notable progress, chiefly in the south of Russia, and the Ural district, and in 1909 the output, as well as the home consumption, reached the highest level known, being above that of the banner year 1904. In 1904 Russia produced 2,461,145 tons of iron; in 1908, 2,369,806 tons; and in 1909, 2,606,129 tons. During the first four months of 1910 the output was 922,838 tons, as compared with 825,322 tons in the corresponding period of 1909.

There were 3,117,742 tons of pig iron produced in the empire in 1909, against 3,193,548 tons in 1904, when the production reached the highest level in the history of the country.

The preliminary data for the first half of 1910 show a considerable increase as compared with the same period of 1909 and 1904, as follows:

Pig iron, 1904, 1,454,839 tons; 1909, 1,412,903 tons; 1910, 1,487,097 tons.

Half products, 1904, 1,503,225 tons; 1909, 1,488,709 tons; 1910; 1,687,097 tons.

Manufactured iron, 1904, 1,259,677 tons; 1909, 1,279,035 tons; 1910, 1,443,548 tons.

The production of coal in European Russia in 1909 aggregated 24,080,645 tons, compared with 24,677,419 tons in 1908, a decrease of 596,774 tons. The output in European Russia for the first quarter of 1910 was 6,225,806 tons, against 6,338,709 tons for the same period of 1909, a decrease of 112,903 tons. The falling off in the production is due to the decreasing consumption of this mineral by the Russian railways, which are now using naphtha for fuel on account of the prevailing low prices of this product.

The production of naphtha in the Baku district amounted to 7,908,064 tons in 1909, compared with 7,532,258 tons in 1908, an increase of 375,806 tons.

In the bituminous mines of Pennsylvania the death rate per thousand men employed was 2.72 during the year 1909. In the anthracite mines the death rate was 3.32 per thousand men employed.

Explosion at Bellevue, Alberta.

By E. JACOBS, Victoria, B.C.

On the night of December 9th an explosion took place in the Bellevue mine of the West Canadian Collieries, Ltd., situated along the Canadian Pacific Railway Company's Crow's Nest line, two miles east of Frank, southwest Alberta. Immediately after receipt of information concerning the disaster, steps were taken to send from Hosmer, British Columbia, distant 45 miles by rail from Bellevue, the Draeger oxygen breathing apparatus and auxiliary appliances from the British Columbia Government mine-rescue station, established there last autumn, and, as well, that of the Hosmer Mines, Ltd., which apparatus, used by men from Hosmer who had taken a special course of training in mine-rescue work, proved of much service in saving the lives of some of the men in the mine at the time the explosion took place, and kept the number of fatalities down to 31.

A specially noteworthy incident in connection with the mine-rescue work was the self-sacrifice of Fred Alderson, as indicated in the following account: "One of the special party rushed from Hosmer, with the British Columbia Government oxygen helments for use in the mine, Alderson led the rescue party direct to the danger zone, and himself succeeded in getting five men out of danger before he was overcome. He was skilled in the use of the helmet, and while the party was making its way back to fresh air, saw an unknown Italian fall to the ground. Hastily picking him up, Alderson pressed his helmet on the man (whose life was thereby saved) and, thinking he could stand the poisonous fumes until he could reach the purer air, started to run. He had not gone a dozen yards, however, before he was overcome, and although some of the party saw him fall they could do nothing to help him, as they were in bad shape themselves, and, in addition, were dragging other unconscious men to a place of safety. As soon as they reached an air station they sat down the men they had brought out and rushed back to save Alderson, but he was dead before he was brought into the pure air."

Fred Alderson was born in Durham County, England, in 1875. He worked in the Kimblesworth colliery for eight years, and prior to leaving there was deputy overman. At the Hetton colliery, where he worked three years, he was back shift overman. For two years he was engaged in shaft-sinking in the Transvaal, South African Republic, and next spent a similar period at Nanbada, Central India. Returning to England, he was company's inspector at the Kimblesworth colliery for two years, after which he went to Texas, U.S.A., where he was a year. About the middle of 1909 he removed to Hosmer, where he was actively engaged in coal mining until his recent untimely death. He held coal mine manager's certificates for Great Britain, British Columbia, and Alberta. In England he took the St. John's ambulance training course, and was instrumental in getting a class started in Hosmer. Last year, in compliance with the law of the Province, the Hosmer Mines, Ltd., put in Draeger mine-rescue apparatus, and at the time it was installed the mine officials were trained in its use. Alderson was one of these, and received instruction in the use of the oxygen breathing helmet and accessory appliances from the Draeger representative who supervised the establishment of the company's mine-rescue facilities at the Hosmer colliery.

Alderson left a widow and four young children. The miners at Hosmer promptly initiated a movement for the benefit of the bereft family, and public subscription lists were opened in several towns in eastern British Columbia and at others in Alberta. The Government of British Columbia has shown its appreciation of Alderson's heroic conduct by subscribing the sum of $500 to the fund being accumulated for the benefit of the widow and orphans.

A coroner's jury is investigating the cause of the disaster. The first witness called was James Burke,

Fred Alderson, the Hero of the Bellevue Disaster

secretary of the Bellevue local union of the United Mine Workers of America, who testified to having, on December 3, telegraphed the chief inspector of mines for Alberta asking for an inspection of the mine, the presence of gas in the mine having been reported by miners.

The Alberta Government report for 1908 contains the following reference to the Bellevue mine: "At the Bellevue mine, a new tipple has been erected, equipped with cross-over dump, and picking tables, capable of

handling one thousand tons per day. An electric light plant for lighting the tipple, mine buildings and main gangway of mine has been installed. Wolf safety lamps have been introduced, which add greatly to the safety of these mines, and all blasting is done by qualified shot-lighters."

The Government official report for 1909 was as follows: "A steel tipple fitted with Greene dump with a capacity of 1,500 tons per day, is being erected by the Bartlett Snow Company, and one high-pressure compressed air plant, one 8-ton and two 5-ton compressed air locomotives have been installed. The present mine track is being relaid with 40-lb. steel. One 78-inch Sirocco fan, capable of giving 100,000 cubic feet of air per minute with a 2-inch water gauge, and one 150-k.w. electric generator for lighting purposes, driving fan, tipple, etc., have been put in. The power house is being built of masonry. A considerable amount of diamond-drilling is being done on the property to ascertain the quality and position of the coal seams at a depth of 400 to 500 feet."

The official report for 1910 has not yet been published.

Retirement of Managing Director of Consolidated M. and S. Co.

About the end of December public announcement was made of the intention of Mr. W. H. Aldridge, of Trail, B.C., to retire from the active management of the Consolidated Mining & Smelting Company of Canada, Limited, of which he has been managing director since the organization of the company. In this connection, Mr. Aldridge has been quoted by the Daily News, Nelson, as having said: "While it is true that I am giving up the active control of the Consolidated Company's operations, yet I expect to remain as a director and in an advisory capacity, and intend to keep in as close touch with the various questions involved in the company's general policy as in the past. My decision to give up the general management was made in order to enable me to become associated with William B. Thompson, of New York, who is a director of several of the largest copper-producing companies in the United States, and who, with Gunn, Thompson & Company, has control of a number of the leading copper mines of Arizona and Nevada. Mr. R. H. Stewart, who has for several years so ably managed the Consolidated Company's mines, has been appointed general manager, and Mr. S. G. Blaylock, formerly metallurgist at the Trail smeltery and lately superintendent of the St. Eugene and Sullivan mines, becomes assistant general manager."

Mr. Aldridge left the Brooklyn Polytechnic in 1883; he graduated as a mining engineer at Columbia University, New York, in 1887. He was assayer, chemist, and metallurgist with the Colorado Smelting Co. (now the American Smelting & Refining Company), 1887-1892. Then he was general superintendent, assistant manager, and manager of the western interests of the United Smelting & Refining Works (now American Smelting & Refining Company) at Helena and Great Falls, Montana, 1892-1897. Next he was employed as mining and metallurgical engineer by the Canadian Pacific Railway Company, and was first engaged in reporting on Rossland, Boundary, and other Canadian mining camps. In 1898, the Heinze smeltery at Trail was purchased by the Canadian Pacific Railway Company, and thereafter for six or seven years it was known as the Canadian Smelting Works, until in 1905 it became the property of the Canadian Consolidated Mines, Limited, a company organized to acquire the various mining and metallurgical properties now held by the Consolidated Mining & Smelting Company of Canada, Limited, the changed title of the Canadian Consolidated Mines, Limited, as from January 1, 1906. Prior to the organization of the merger company, Mr. Aldridge's official title was that of Chief of the Mining and Metallurgical Department of the Canadian Pacific Railway Company. During the thirteen or fourteen years Mr. Aldridge has been associated with the Canadian Pacific Railway Company he has had the oversight of all the company's mining interests, including the collieries the company established and still operates at Bankhead, Alberta, and Hosmer, B.C., and the large though undeveloped coal mining interests the company holds in the upper Elk River district. The steady expansion of the operations of the Consolidated M. & S. Co. during the last five years has been under the active direction of Mr. Aldridge, who has been a member of the American Institute of Mining Engineers from 1889 to date, and as well for a number of years a member of the Canadian Mining Institute.

Mr. Robert Holden Stewart, who has succeeded Mr. Aldridge as general manager of the Consolidated Company, graduated as a mining engineer at McGill University, Montreal, Quebec, in 1896, obtaining first rank honours in natural science and the Governor-General's medal for highest general standing in final examination for his B.Sc. degree. He went to Rossland several years ago from the Bankhead mines, Alberta, and succeeded Mr. James Cronin as manager of the Consolidated Company's mines when that gentleman retired. He has since devoted himself assiduously to the further development and improvement of the mines, and is well-known in the Kootenay and Boundary mining districts as a fully competent manager and a tireless worker, very zealous in the promotion of the company's interests. He is a member of both the Canadian Mining Institute and the American Institute of Mining Engineers, and has been on the Council of the former.

Mr. Selwyn Gwillym Blaylock, the new assistant general manager, is also a McGill University B.Sc.; he graduated as a mining engineer in 1899. He has been in charge of the St. Eugene mine and concentrating mill for several years, and, like Mr. Stewart, has shown much zeal in the performance of his responsible duties. He is a member of the Canadian Mining Institute and is at present on the Council of the Institute.

Smelting in the Interior of British Columbia.

By E. Jacobs, Victoria, B.C.

The following notes will serve to give a brief description of the smelters now being operated in the Kootenay and Boundary districts of British Columbia:

Consolidated Mining & Smelting Co. of Canada, Ltd.

The works of the Consolidated Mining & Smelting Company of Canada, Ltd., include copper and lead blast furnaces. Distinctive features here, in comparison with other reduction works in British Columbia are the use of the Huntington-Heberlein roasters and converters, and the Betts electrolytic process for refining lead.

An idea of the extent of the company's operations during 1910 may be obtained from the following figures; Tons smelted, 445,210. Metal contents, gold,

138,901 oz.; silver, 2,017,007 oz.; lead, 33,871,837 lb.; copper, 5,282,139 lbs. Total value, $5,543,574. The figures for the company's fiscal year ended June 30. 1910, were generally higher, especially in lead produced (42.368,816 lbs.). while total value was nearly $400,000 greater. Some 550 men are employed at the works, which are situated at Trail, on the Columbia River, and within a few miles of Rossland, with which mining camp there is railway connection.

Lead Smelting.

Of the three sampling mills, two are arranged to deal with lead and dry ores. The equipment of one of these consists of Blake and Farrel crushers, rolls, and Vezin and Brunton samplers. The capacity of this mill is 30 tons per hour. Oxidized lead and dry ores are first crushed to a 6-inch ring, the final sample being ¼-inch, and the reject going direct to the furnace charge bins. Galena ores and coarse concentrates are crushed to ¼-inch and bedded. In each case the samplers cut 1-500th part and deliver it to the quartering floor. Fine concentrates are usually sampled by the fifth-shovel method and are placed on the lead beds.

The lead ore supply is mainly heavy sulphide, with comparatively little dry ore. the lead furnaces carrying a charge of from 35 to 45 per cent. lead, as compared with the customary 10 to 15 per cent. More than 30 per cent. of the ore received runs from 20 to 75 per cent. lead, the remainder consisting of dry gold and silver ores, a small quantity of oxidized lead ore, and some pyritic mill concentrates. The sulphide, with lime rock, lead matte, etc., is treated in the Huntington-Heberlein roasters and converters. The resultant lead sinter is smelted in the blast furnace with dry ores, etc. The lead beds are made up with heavy ores and concentrates only; they contain about 600 tons each. with 38 to 40 per cent. lead.

There are seven Huntington-Heberlein circular roasting furnaces, 26 feet in diameter, with hearths revolving once in three minutes. Stationary cast-iron rabbles work the ore through in about two hours. The making up of the roasting charge is important. An approximate analysis of the charge as now run is as follows: Lead, 40 to 44 per cent.; iron, 10 to 13 per cent.; silica, 8 to 11 per cent.: lime, 7 to 10 per cent.; zinc, kept under 10 per cent. if possible. Pyritic concentrates and matte form part of the charge. The converters number 24; they are 8 feet 8½ inches in diameter, and are made in four sections bolted together. The time of converting varies widely with the charge, but averages three 10-ton charges in 24 hours, with a 10 to 12 oz. blast, which is decreased to 2 oz. at the close.

Properly made up, carefully fired, roasted, and converted, the product will be fairly hard, yellowish or grayish yellow, showing some litharge, and be easily broken up with little fines. In the furnace it will run with cool top and bright tuyeres.

The two lead blast furnaces are, respectively, 45 by 160 inches and 45 by 140 inches at the tuyeres. One of these has smelted as much as 260 tons in a day, but the average is about 170 tons or ore, beside by-products, matte, slag, etc., these constituting 20 to 30 per cent. of the charge. The furnaces are standard type, with brick crucibles water-jacketed to the top of the bosh, above which is a firebrick shaft. The height of the charge is 17 feet 6 inches above the tuyeres, and the blast used is 32 to 34 oz. The lead bullion flows from the side of the furnace into a kettle of 50 tons capacity, from which it is pumped by a 1½-inch centrifugal pump into vertical anode moulds. Frame cars of special make, each holding ten anodes, are taken in railway cars to the refinery. The matte and slag are tapped into a large receiver at the end of the furnace; the slag overflows into a granulating launder, while the matte is tapped from the receiver into pots.

The charge usually has about 85 per cent. of Huntington-Heberlein roast, varying considerably with the ores, and some oxidized and siliceous dry ore and lime rock. The coke is about 12½ per cent. of the charge, not taking into account slag and easily smelted by-products. An addition of 100 to 300 lbs. of slag from the high-grade copper furnace is made to each charge to keep it open, make the furnace action uniform, and reduce the percentage of zinc. The lead in the charge averages about 40 per cent., but it has been successfully run as high as 55 per cent. Sulphur is kept below four per cent., the lower the better, as the matte fall is less. The speed of running decreases markedly with a small increase of sulphur. From 30 to 40 per cent. of the sulphur is eliminated in the blast furnace.

The slag is kept at about 31 to 33 per cent. silica, 18 to 20 per cent. lime, 24 to 30 per cent. iron and manganese, 7 to 12 per cent. zinc oxide, and 8 to 16 per cent. alumina. It contains about 0.4 ounces silver and a little more than 1 per cent. lead. With high zinc the lime is reduced to keep the slag fluid. It is not profitable to run siliceous ores to bring the slag much above 33 per cent. silica, as the furnace runs too slowly. Alumina gives no serious trouble. Iron and manganese may vary between the percentages above given without making much difference in the furnace running. Scrap iron is added occasionally, although unnecessary when the charge is good.

At present only one furnace is being operated, and this produces about 75 tons of bullion per day. A single day's production has been as much as 130 tons. An average analysis of the bullion is: Copper, 0.22; manganese, nil; zinc, 0.098; antimony, 0.32; arsenic, 0.28; nickel, cobalt and cadmium, nil; bismuth, 0.0133, and lead, 98.5 per cent.; silver, 100 ounces and gold, 0.5 ounces per ton. A furnace is operated continuously for about seven months; then if accretions have accumulated sufficiently to make it profitable to blow it out and clean up, the other furnace is blown in.

Lead Refining.

In the refinery there are 240 tanks, 3 x 8 x 3½ feet, and pumps keep the electrolyte circulating in these. Each tank has a capacity of 20 anodes, which weigh 370 pounds each; they are cast with shoulder lugs, which rest on copper current bars on the sides of the tanks. The anodes are spaced 4½ inches apart with the bodies down in the tanks. Cathodes, consisting of sheets of pure lead about 1-16 of an inch in thickness, hung on ½ by ¾-inch copper bars, are placed between and outside the anodes, 21 in each tank. The electrolyte used is lead fluosilicate with free fluosilicic acid, averaging 12 per cent. acid and 5 to 6 per cent. lead. Between half a pound and one pound of glue per ton of lead is daily added to the electrolyte to prevent the lead deposit becoming soft and non-coherent and the tanks from rapidly short-circuiting. The tanks are operated with a current density of 16 amperes per square foot of cathode area; a reduction to 12 amperes is proposed, it having been found that this gives better results. The voltage averages 0.32 volt per tank, the contacts causing a loss of not more than 0.02 volt per tank. A tank is worked out in about 8 days, and 15 per cent. of the anodes, as scrap, goes back to the melting pot after being washed. The cathodes are removed from the tanks, washed, melted, and cast into pigs of lead—of 190 pounds each for the Chinese trade, and half that

weight for other markets. An average analysis of 2,000 tons of lead ready for shipment was: Arsenic and bismuth, nil; zinc, 0.0005; silver, 0.0013; copper, 0.00075; lead, 99.9938; iron, 0.00075; tin, 0.0001; antimony, 0.0028.

Most of the slime adheres to the anode scrap, though some settles in the electrolytic tanks, which are cleaned out monthly. From the tank room it is taken in copper cars to the slime plant, where it is agitated in tanks with hot water. Afterwards the water is drawn off and evaporated in steam coil tanks to recover the electrolyte. The slime is filtered and dried, and next melted in a water-jacketed reverberatory furnace lined with magnesite brick. The impurities are oxidized off, and dore metal running 960 to 975 parts gold and silver is obtained. The fumes pass through a series of inverted U cooling flues, in which most of the volatilized metals is recovered, the condensed fume going to the blast furnaces. The dore metal is parted in sulphuric acid. The silver sulphate is run into steam-heated tanks, where the silver is precipitated as a slime by bars of metallic copper. The silver and gold are collected, melted, and cast into bars. The gold is 995 fine and the silver 999, the latter in bars of about 80 pounds each. Fine gold and some silver are sold to the branch of the Royal Mint at Ottawa, Ontario, and the United States Assay Office, Seattle, Wash. Silver finds its chief market in the Orient; refined lead is sold in Eastern Canada, the Orient, and other places.

By-products are copper sulphate and antimony. The copper sulphate solution, obtained in the course of treating the slimes, is taken to the bluestone plant where copper sulphate is crystallized from it, making a commercial product used by farmers to pickle their seed wheat and so kill the smut in it. When commercial conditions make it profitable to also save the antimony, this is recovered by a special electrolytic process discovered by Mr. A. J. McNab, superintendent of the company's smelting works.

COPPER SMELTING.—There are five copper blast furnaces, as follows: Two of 42 by 300 inches at the tuyeres; one of 42 by 263 inches, and two of 42 by 240 inches. The height of the charge is 9 feet above the tuyeres, and the furnaces are operated with air pressure of 36 ounces. Two forehearths are used for each furnace, but only from 0.25 to 0.50 per cent. of the total matte is caught in the second settler. Most copper ores are smelted raw to a low-grade first matte. The slag from the low-grade furnaces runs about: Silica, 43 to 46 per cent.; iron, 14 to 15 per cent.; lime, 20 to 22 per cent.; copper, 0.1 per cent., and a very little gold and silver. The first matte, containing about 15 per cent. copper, 27 per cent. sulphur, and 56 per cent. iron, is granulated, roasted in O'Hara furnaces to about 10 to 12 per cent. sulphur, blown in Huntington-Heberlein converters to a product which runs 3 to 4 per cent. sulphur, and then smelted in a high-grade furnace, with suitable ores, to a matte running about 40 per cent. copper, which last product is shipped to Tacoma, Wash., for Bessemerizing. The slag from the high-grade furnace analyzes about: Silica, 40 to 42 per cent.; iron, 26 to 28 per cent.; lime, 16 to 18 per cent.; alumina, 10 to 12 per cent., and copper, 0.35 per cent.; with gold 0.02 ounce. Some of this slag is used in the lead furnaces and part of its gold content recovered there.

(To be Continued)

SPECIAL CORRESPONDENCE

ONTARIO.

Cobalt.—At the annual meeting the condition of the Savage of the McKinley-Darragh group will be the chief subject of comment. From a mere prospect in one year the Savage has developed into a mine producing between 60,000 and 70,000 ounces per month with 300-foot ore body on two veins and five other veins that will certainly make some ore.

The damage at the plant of the Cobalt Hydraulic at Ragged Chutes has been repaired and mines are now getting a fair air service. It will, however, make a sensible difference in the production particularly at the Nipissing and La Rose where steam plant is now inadequate to the needs of the company.

Fifteen Cobalt companies shipped bullion in 1910, aggregating 934,666 ounces, and valued at $493,950. Already this month eight mines have shipped 133,135 ounces, worth $65,407.

The amount of concentration in the mills of Cobalt has more than doubled in 1910 and the tonnage was greater by almost ,000 tons. The bulk of the tonnage from the Cobalt camp went to the States, but more than half the values in the ore stayed this side of the line.

In declaring a dividend of 10 per cent. payable on March 15 the Kerr Lake has joined the other three Cobalt companies that have paid over a hundred per cent. The T. & H. B., the Crown Reserve, the Buffalo, the Kerr Lake and the Nipissing, with an aggregate capitalization of $12,007,718, have paid 14,272,113.

During December the Nipissing mined 371,559 ounces of the net value of $201,022. Ore shipped after mining expenses had been deducted amounted to $437,615. A good high grade lens of ore has been cut at 122 shaft; 40 feet of 64 has been opened up at the intermediate level and shows very rich; an inclined raise on the west side of the Fourth of July shaft has cut into great ore and the winze in the west drift is proving good below the 170 foot level.

Mr. A. P. Seymour has resigned his position as manager of the Cobalt Lake. He will be succeeded by Mr. M. B. R. Gordon, who has been manager for the Little Nipissing for some time. Mr. Gordon will act as the consulting engineer for the Little Nipissing for the next few months at any rate, but will live at the Cobalt Lake.

A number of Cobalt men are interested in the Beauce placer fields along the Famine River. Mr. J. Rose an old Australian miner, states that after persistent prospecting the ground offers good possibilities for a dredge. An old report stated that the average from 28 shafts was 15 dwt.

At the annual meeting of the Cross Lake Mining Company it was decided to allow the Cobalt Coalition to work through the property of the company provided that the former company should get a 25 per cent. royalty on any of the ore extracted. The main shaft of the Cross Lake has been sunk to the 225-foot level. At the 210-foot level a drift has been pushed towards the diabase contact 75 feet under the lake.

At the quarterly meeting of the directors the Coniagas declared the 3 per cent. regular and the 6 per cent. bonus, making in all $360,000. The property has now paid altogether 44 per cent., or $1,760,000.

The Crown Reserve has now definitely started to develop its claims in Porcupine. A gang of men have commenced development on the McEnaney property near the Hollinger.

The Union Abitibi, on Opasatika Lake, near the Larder Lake goldfield, announces that it has all its four-stamp mill on the ground and will erect it this summer. It has numerous quartz

leads in which some specks of free gold have been found.

The Thelma Gold Mining Company, of Montreal, has bought six more claims in Bryce Township to add to its property. A test consignment of ore has been sent from the 25-foot shaft to McGill University for sampling. The company announces its intention of putting in a plant soon.

With an ore body 180 feet long on the 175-foot level the Cobalt Provincial is now paying chief attention to the discovery of fresh ore and the completion of its ore sorting plant at the mine. The new camps are almost completed.

Elk Lake and Gowganda.—There has been a little revival in mining activity at Elk Lake. Some of the prospectors who went to Porcupine and did not make a stake have returned to the Montreal River section again. The Beacon Consolidated announces that it will surely develop the Cleaves claim. The Tee Arr has ordered a good new plant from England and the Syracuse states that it will open up its property again in the spring. Meanwhile transportation hangs up activity.

It is reported from Elk Lake that the Miller Lake O'Brien will ship this year in the neighbourhood of a quarter of a million from its property.

That the Gowganda camp is still in point of shipments the second best in northern Ontario is shown by the following table of shipments: Millerett 345, Reeves Dobie 62, Boyd Gordon 30, Lucky Godfrey 20, Miller Lake O'Brien 59, Burke Remey 2, and Welsh 1.25. Total 1,419.25.

Porcupine.—In all probability the railroad at Porcupine will go down the east or undeveloped side of Porcupine Lake, thereby leaving one or two townsites out in the cold. There is an excellent grade. The station will certainly be at the Government townsite at Golden City.

Fifty men are working at the Foley O'Brian and the four-drill compressor plant has been running since the early part of the month. The vein is from 18 to 20 feet wide and there is a good deal of galena associated with the gold in the lead. Three drills are working night and day.

It is stated that blanketing is as prevalent in the Cripple Creek section of the camp as it has always been wherever Cobalt prospectors have travelled. Whitesides Township has been staked solid while not more than 25 properties were recorded.

T. E. Godson, K.C., of Bracebridge, has been appointed police magistrate at Porcupine at a salary of a thousand dollars a year.

The Dome Mining Company is rushing in 4,000 tons of supplies for the next year, and including all its heavy machinery.

At the property a force of carpenters is erecting camps. Quite a number of Porcupine companies have been incorporated within the past month. One of these is the Preston East Dome mines, with a capital of $3,000,000.

The other is the Montreal Tisdale Gold mines, with a capital of $2,000,000, and headquarters at Sault Ste. Marie.

After working steadily for a year the Scottish Ontario has now cut its vein at the 100-foot level. The vein appears to be wide, and though only specks of free gold were discovered at first, values are now improving.

Jack Munro reports that he has now under option some good claims in Deloro and Shaw. The ex-pugilist expects to sell them at a good price to United States capitalists.

Mr. P. A. Robbins, of the McKinley-Darragh, has left the employ of that company and will go to Porcupine in the first two or three days of this month.

South Lorrain.—It is extremely improbable, in spite of the extravagant management of the Keeley, that more than $400,000 has been spent on the mine to date. It is understood that the worth of the Keeley lies in its big surface cobalt veins, which on neighbouring properties have shown silver at depth. There is good ore in a new shaft near the Beaver Lake line and it is reported that the vein has been cut at the 240-foot level with good results.

The Wettlaufer has declared a 2½ per cent. regular and 2½ per cent extra, payable in February and March respectively. The latest reports of the mine state that there is now an excellent ore body 200 feet long at the 300-foot level, and that some of the bunches are very spectacular. The head office will be moved from Toronto to New York, which probably means that the Lewisohns have now control.

The South Lorrain shipments to date are: Wettlaufer 421.50, Keeley 44.34, and Bellellen 7.50, making a total of 473.34.

The Wettlaufer shipments for 1910 were 150 tons of seconds and 160 tons of high grade. The seconds ran between 500 and 600 ounces and the high grade between 3,000 and 4,000. There are two more cars of high grade waiting to be shipped when it is possible to take them out conveniently.

ALBERTA.

Blairmore, January 14.—The severe storm that swept through the Pass from the 8th to the 12th of this month blocked the railways to such an extent that all freight traffic was abandoned. This necessitated the closing of the coal mines during that period.

The consumption of a deal is rumored involving the purchase of a considerable area of coal land in the South Fork district. The details of the transaction have not been made public, but it is understood that the purchaser is a well-known capitalist in the United States. The value of this acquisition is not readily apparent, as it is evident that the mines already opened are fully capable of supplying not only the present demand, but also the demand for years to come.

The coroner's inquest into the causes of the disaster at the Bellevue mine on December 9, of last year, has been completed. The thoroughness of the investigation may be judged from the fact that it extended over a period of ten days. It will be noted that the verdict of the jury attaches blame to no one. The verdict reads:

That thirty men came to their deaths by carbon monoxide poisoning, and one by a combination of carbon monoxide poisoning and fractured skull. The said carbon monoxide and fractured skull being caused by a percussion of air caused by a cave of rock over chutes No. 76 and No. 78.

The jury respectfully submit the following riders to the verdict:

1. That more mine inspectors be appointed.

2. That a Draeger apparatus station be provided in this district.

3. That telephones be installed under the supervision of the chief inspector of mines, where practicable, in the underground workings of coal mines.

4. That a thorough investigation be made of means of preventing the loss of life by caves in coal mines.

5. We consider that negligence is in evidence on the part of both operators and miners in the carrying out of the provisions of the Coal Mines Act, and we would most strongly recommend a stricter adherence to the intent of this Act.

BRITISH COLUMBIA.

[Owing to illness, our correspondent in British Columbia has been unable to prepare for this issue of the Journal his usual summary of mining news of that province. He has sent, however, the following notes on Rossland mines in 1910, which were written before he was taken ill.]

Rossland Mines in 1910.

So far as can be ascertained from the available information relative to mining operations in Rossland camp, the total production was larger in 1910 than in 1909. The preliminary figures indicate an increase of about 16,000 tons in the total tonnage of ore mined, and the recovery of metals shows a general gain as compared with that of the immediately preceding year. While this increase is not large—in value of metals produced it is estimated at nearly $100,000—it denotes progress, and is, therefore, gratifying. The output of the Centre Star group of mines constitutes more than two-thirds of the total tonnage of ore mined, and nearly a similar proportion of the metals re-

duced. The mines of the Le Roi No. 2, Ltd., come next, and then the Le Roi mine, the remainder of the total production being contributed by half a dozen small shippers, in quantities varying up to about 50 tons.

Centre Star Group.—The last annual report of the managing director of the Consolidated Mining and Smelting Company of Canada, Ltd., which owns this group of mines, among others, gave information relative to them for the fiscal year ended June 30, 1910. The ore reserves of the group, at the end of the fiscal year, were estimated at 245,640 tons. The following are among the developments during the latter half of the calendar year 1910.

Beside the new ore in the Centre Star, mentioned in the annual report, further development has proved the existence of ore not previously definitely ascertained as being in the mine. Ore was found on the 2nd, 3rd, 4th and 5th levels, and exploration is being continued with the expectation of finding these ore shoots on lower levels. A new drift (537) has developed the downward continuation of some of the ore shoots found on the 4th level; these are yielding a fair tonnage, with value above the average, and they give promise of a considerable increase in quantity. The ore taken from the Centre Star is generally of a good shipping grade, with value chiefly in gold, the silver running about one ounce to the ton, and copper 0.6 per cent. Diamond drilling is being continued in the lower levels of this mine. The 16th is the lowest level; it is at a depth of 2,300 feet on the incline, or approximately 2,000 feet in vertical depth. This is only about 1,600 feet above sea level, and is nearly down to the level of the company's smelter at Trail.

Conditions at the War Eagle during the latter half of the year continued much as stated in the annual report. One important change, though, was the development on the 12th level, which proved the existence of a strong vein, but the ore taken out was of rather low grade. Diamond drilling in the vein from this level was resorted to, with the result that high grade ore was found to occur 75 feet deeper. Assays of samples taken across 5 feet of this ore returned a gold value up to 3.25 oz. per ton and 0.4 per cent. copper. It was decided to sink in the vein from the 12th level preparatory to stoping the high grade ore found here. This important development resulted from following some small streaks of ore mentioned by the managing director in his report. Stope 1086 continued to produce a large tonnage of high grade ore during the latter part of the year, and stope 1168, opened since the annual report was made, has also been giving a considerable tonnage of ore of excellent quality.

In the Idaho, stope 470 has been holding out well, and stope 539 has been maintaining its producing capacity. Ore from this mine is of generally good grade, above the average of the Centre Star ore, the bulk of which does not run quite so high in gold as that from the Idaho.

Conditions in the Iron Mask remained much as during the fiscal year. Stoping has been in progress in the orebody opened by the cross-cut from the Centre Star 4th level, and ore has also been mined below the Iron Mask old 5th level, which is only 40 feet above the Centre Star 4th level cross-cut, which has made these ore bodies accessible.

The total footage of work done in 1910 in further development of the Centre Star group of mines was 12,566, chiefly drifting and cross-cutting. Diamond drilling totalled 27,698 feet. About 400 men are employed in these mines. The tonnage of ore for the year, allowing an average output for December, was rather more than 191,000 tons.

The following figures may prove of interest: Aggregate tonnage of ore mined since production was commenced in 1894, 1,477,324 tons. Metal contents of value: Gold, 721,636 oz.; silver, 850,750 oz.; copper, 28,239,017 lbs.; gross value, $19,508,-033. These statistics are to July 1, 1910; if the production made during the latter half of 1910 be added, an approximate tonnage of 1,570,000 tons, and a value of nearly $20,500,000 will be obtained. There have been fully 26 miles of underground development or narrow work done in the mines of the group.

Le Roi.—While the production, tonnage and development work figures of this mine for 1910 are higher than for 1909, they compare unfavourably with those of earlier years when the mine was being worked on a larger scale. Exploration work last year was chiefly with diamond drills, with which 11,421 feet of drilling was done; cross-cutting, drifting, etc., totalled 1,745 lin. ft. The output of ore was about 14,275 tons, and the valuable metal contents as follows: Gold, 9,567 oz.; silver, 8,070 oz.; copper, 294,194 lbs. The only work being done late in the year was that of stoping out some ore known to have been left in the ground above the 200-foot level.

The Le Roi Mining Company is now in voluntary liquidation, the shareholders having authorized the winding up of the company after much exploration with diamond drills had failed to find any large shoots of ore of a sufficiently high grade to give reasonable promise of profitable results should the operation of the mine be continued. What will be the future of the mine is not known. Mr. A. J. McMillan, late managing director, is liquidator, and he will doubtless dispose of the company's property, which includes the smelting works at Northport as well as the mine at Rossland, in such manner as will best conserve the interests of the shareholders.

Le Roi No. 2.—The gross tonnage of ore produced from the mines of the Le Roi No. 2, Ltd., in 1910, was about 47,000 tons, approximately one-third of which was milled at the mine (producing 1,370 tons of concentrate) and the remainder was shipped crude to the smeltery at Trail. The development work done underground totalled 4,400 lineal feet, beside which there was 11,500 feet of diamond drilling done.

The cross-cut from the Josie shaft, at the 1,300-foot level, commenced last year, was driven south until it reached the vein at about 1,000 feet from the shaft. The ore body opened proved to be large, but the value contained in the ore was less than had been hoped for, though the fair percentage of copper in it was regarded as a promising indication. Most of the year's work on this level having been dead work, there has not yet been time to develop the ore body extensively. Satisfactory results are expected from the further development of this ore, there being every reason to look for the ore in this deep part of the mine yet proving as profitable to the Le Roi No. 2 Company as that at depth in neighbouring mines has proved to other companies operating them.

In other parts of the mines, at various depths down to the 900-foot level, much work has also been done during the year, and in several instances important shoots of ore have been discovered. Ore was opened in the Hamilton vein, in the west end, between the 700 and 500-foot levels. In the May Day vein, discovered six years ago, ore has been found above the 100-foot level and work done in it. In the Annie vein ore was found above the 500-foot level, besides which stope 523 was opened and worked. A rich veins was quite lately found on the 500-foot level, but there has not yet been sufficient time to do much development in it. Driving towards an entirely new vein, known as the Shackleton vein, on which no work had previously been done anywhere on the property, has been in progress during the latter part of the year. On the northern part of the group, 100 feet of sinking was done, by contract, in the Surprise vein, and after ore of good grade had been found, work was stopped temporarily, but will be resumed in the near future.

Besides the foregoing work, some diamond drilling was done in No. 1 mine. There was little change made in the surface works, these being adequate to present requirements of the mines. An exception is that a self-acting tramway is being put in between the ore-sorting bins and the shipping bins, this to be worked by a small induction motor.

The company, which ordinarily employs about 110 men, with Mr. Ernest Levy in charge in the province, during the year paid

three dividends each of two shillings respectively on March 8, July 8, and November 8. Its capital is £600,000 in 120,000 shares of £5 par. The total of dividends paid to date is approximately $1,062,000.

Velvet.—Shipments of ore from this mine during two months of 1909 and four months of 1910 totalled 647 tons, containing 576 oz. gold, 647 oz. silver, and 45,290 lbs. copper. One lot of 17 tons averaged 3.13 oz. gold, and 5.3 oz. silver per ton, and 9.76 per cent. copper. Much of the ore shipped averaged about $24 per ton, gross value. Years ago this mine was opened by six levels to a depth of 500 feet. An adit drains the mine to the 4th level. The larger part of the ore above No. 5 level has been extracted. The vein in the upper levels has varied in width from 3 to 8 feet; diamond drilling has shown the occurrence below the 6th level of 11 to 13 feet of solid ore, samples of which have assayed $18 to $20 per ton. It is stated that as the country is less disturbed below the 6th level, the ore body is stronger and better defined than above it, and the ore of good average grade. The mine equipment including power plant, stamp mill, concentrating tables, etc., cost about $70,000. Excepting that done under lease in 1909 and 1910 no work of consequence has been done on this property since 1903.

Other Properties.—Very little information was received relative to other mines in Rossland camp, the following brief notes include all that can be given at this time. The Cliff is being developed by the Granby Company, under option of purchase. Two tunnels are being driven. Air for driving two machine drills is obtained from the Centre Star. Between 15 and 20 men are employed.

The Nickle Plate has been worked on a small scale during recent months by some leasers, who have shipped about 850 tons or ore. Part of this was gathered up on the surface and other ore has been taken from a drift on the 200-foot level of the mine.

The I.X.L. has also been worked in a small way and a few hundred tons of ore extracted.

In the south belt, galena ore of good quality has been reported as occurring in the Blue Bird and Mayflower mines, both of which have made small shipments to the smeltery.

MINING NEWS OF THE WORLD.

GREAT BRITAIN.

The Welsh anthracite coal trade during 1910 was a disappointing one. The year opened with every prospect of being a profitable one, but the mild Continental winter, the Paris floods, the uncertainties prevailing over the Eight Hour Act, and the absence of American and Canadian orders, which at one time formed an important factor in the market, all contributed to the period being one of the most disastrous in its history. The ruling price of Big Vein at the close of the year was 13s. 9d. per ton f.o.b., as against about 18s. for the same class of coal at the opening of the year, and alongside of the gradual fall in price has been constant loss of time at the mines, which has been greater than for several years past. In part, this was due to the sidings at Swansea being so completely blocked up with coal that the railway companies were unable to clear any more from the collieries, with the result that the latter were recently on stop for days together. Lately two anthracite collieries were put up for auction, but in view of possible labour troubles and the poor demand at the moment for the coal, no bid was made. The immediate outlook is somewhat gloomy for the trade in view of the opening up by British capital of the Russian anthracite fields, which will compete in places where Welsh anthracite has been used for years.

SOUTH AFRICA.

Johannesburg.—One of the most serious of the native faction fights which have taken place on the Rand during the Christmas holidays was waged at the Cason mine. One native was cut off from his comrades and was literally beaten to a pulp. Seventy were wounded. Fighting was renewed underground this morning. One man has been killed and many have been injured, several fatally—Reuter.

INDIA.

The gold production of the mines of the Kolar Goldfield (Mysore) and two outside mines (the Hutti Nizam's and the North Anantapur) for December was 48,419 ozs., an increase of 1,147 ozs. compared with the return of the previous month.

RUSSIA.

Warsaw, January 20.—Four hundred miners were entombed alive to-day and forty instantly killed by an explosion in the Casimir coal mine at Sosnowice on the Russo-Prussian frontier. Fire broke out following the explosion, cutting off the escape by the main shaft, but 360 cut their way through a wall separating them from a cross tunnel and came out alive. Rescue parties that were able to enter the mine after the fire had raged for several hours found forty men dead, their bodies badly mutilated. Negligence of the mine owners to apply proper safety devices was responsible for the disaster and the arrest of three of the owners was ordered by Government officials, who arrived on the scene and directed the work of rescue.

Rioting broke out among the rescued miners and the relatives of the men who were killed, and soldiers were called to prevent an attack on the mine owners when they were taken into custody.

AUSTRALIA.

The broken Hill South Silver Mining Company received the following cablegram on January 4 from Adelaide: "Four year and half wages agreement concluded. Supply of Water Bill has passed."

The North Broken Hill Mining Company also received a cable dated 4th instant, from its head office at Melbourne: "Labour troubles settled. Men are to receive 1s. per day extra; all other conditions remain as before."

UNITED STATES.

Butte, Mont., January 21.—The Tuolumne Company is now shipping on an average of about 350 tons of ore a day, which is running from 10 to 12 per cent. copper. At the same time development work is going on and large bodies of ore are being blocked out and the sinking of the shaft from the 1,400-foot level is proceeding and good progress is being made. The management has received bids or offers from at least two smelters for the treatment of its ore, but as yet no decision has been arrived at.

Washington, D.C.—According to Director of the Mint George E. Roberts, in the annual statement of the Bureau of the Mint on the gold and silver production of the world, although the production of gold in South Africa probably will increase, the increase will be slow, while the production in other parts of the world is standing still or declining.

The natural expansion in industry, commerce and wealth can be depended upon to offset the probable slight increase in gold production. The increase for 1910, according to the bureau figures was only $451,100. Africa leads the world in production of gold during 1910, with $170,000,000 worth of its credit. This was an increase over last year of about $4,000,000. The United States came second during 1910 with $96,055,200 produced in gold, compared with $99,673,400 last year. Australasia came third with $65,002,000 in gold, compared with $71,007,900 last year. The total gold production of the world in 1910, the bureau says, was $454,874,000, compared with $454,422,900 in 1905.

In the United States, California resumed first place among the States, which she lost to Colorado in 1897, with $21,146,150 to her credit, compared with $20,703,600 last year. Colorado, in second place, had $20,408,041, compared with $21,846,600 last year. Nevada came third, with $17,941,643, compared with $16,286,200 last year; and Alaska was fourth, with $16,987,990, compared with $20,339,600 last year. Kansas, which last year produced no gold, had to her credit in 1910 $11,163 worth of precious metal.

Joplin, Mo., January 16.—Zinc ores sold as high as $44 for a few lots, $43.50 for a few more, while the major portion of the tonnage brought a $43 base. Small lots sold down as low as $40. The highest price reported paid for any ore was $47.

Calamine ores sold at $20 to $24 for large lots, while small jags sold for less prices. The highest price reported for any lot was $29.

This week marked the first time in the history of the district when heavy tonnages of ore sold on a contract price. Something like 1,200 tons of ore in the Joplin district was contracted for this week on a regular scale of prices based on the spelter market at St. Louis. This movement involves a number of the smelters and a number of the producers, and has attracted the attention of the entire field.

Production is gradually improving again and within another fortnight will be back to its old gait, unless interfered with by bad weather conditions. The surplus ores in the district have been reduced greatly during the shut-down.

A strong demand marked the lead ore market of the past week and ores sold at $57 to $58 per ton of 80 per cent. zinc. Nearly all the large lots received $58, while smaller lots shaded down to $57.

The curtailment in output and increase in demand by the starting of two new smelters has caused the market to respond quickly and the producers are feeling much better over the situation.

Spelter has been steady for the past ten days at $5.40 to 5.45, St. Louis, while the London market has advanced to £24 s. 6d. Lead has been steady at $4.37½, St. Louis.

Goldfield, Nev., January 19.—The resignation of J. R. Finlay as manager of the Goldfield Consolidated Mining Company was announced yesterday, and will, it is stated, take effect next Saturday. Mr. Finlay is returning to New York City, where he will resume practice of his profession as mining engineer. He has been in charge of the Goldfield Consolidated's property for a year, and during that time has brought the affairs of the company to a highly satisfactory stage, achieving remarkable success in production, profits, development and improvement of underground and surface equipment.

No successor to Mr. Finlay has been chosen or at least announced. For the present, operations will continue under the existing organization, with Superintendent J. W. Hutchinson in charge of the mill and Assistant Manager J. F. Thorne in charge of the mines.

Tonopah, Nev., January 12.—The year 1910 closed and 1911 began under the most encouraging conditions as far as the mining industry in Tonopah is concerned. While the latter part of the last month of the year recorded smaller shipments on the part of most mines, it was not due to any fault of the property, but, rather, to the time lost because of the holidays. There is more high grade and milling ore available in the mines now than at the same time last year, if we may judge from general and official report, and it seems certain that if ordinary working conditions prevail during the year, Tonopah mines will score the biggest production in their history.

Coalinga, Cal., Jan. 12.—A 400-barrel gusher has been developed at well No. 1 of the Creme Petroleum Company, which was brought in several weeks ago. Since completion of the well late in November it has been on the pump and making a good production until early last week, when the hole sanded up. In the course of work preparatory to putting the well on the pump again the sand suddenly loosened and the oil commenced flowing in heavy volume.

MEXICO.

Parral, Mexico, January 21.—The future for the Parral district looms up brighter than ever since the Alvarado started to grind, and the Veta Colorado made good its word to buy ore. Fifteen hundred tons in one lump were purchased of P. B. Butler, representing the owners of the Santa Gertrudis property, by the Veta Colorado Company at first, and several more purchases are pending.

COMPANY NOTES

COMPANY NOTES.

Directors of the Wettlaufer mine have put the stock on a dividend basis, declaring a regular quarterly dividend of 2½ per cent. and extra of 2½, payable March 11, to holders of record February 25.

HOLLINGER GOLD MINES, LIMITED.

24 King Street West,
Toronto, Canada, 9th January, 1911.

To the Shareholders,
Hollinger Gold Mines, Limited:

The following general statement of affairs is issued for the information of the shareholders of the company.

The company is incorporated under the Ontario Companies Act with full powers for the mining and treatment of ore and with share capital of $3,000,000, divided into 600,000 shares of five dollars ($5.00) each, of which 100,000 remain in the treasury and 500,000 have been issued as fully paid and non-assessable for transfer of properties, the carrying on of mining operations until the erection of the stamp mill and making provision for milling the ore, etc.

The directors and officers of the company are: N. A. Timmins, of Montreal, President; John McMartin, of Cornwall, Vice-President; L. H. Timmins, of Montreal; Duncan McMartin, of Montreal, and D. A. Dunlap, of Toronto, Secretary-Treasurer. The Toronto General Trusts Corporation has been appointed Transfer Agent and Registrar of stock.

The mining property of the company consists of four mining claims of 40 acres each (160 acres in all), being parts of Lots Nos. 10 and 11 in the Second Concession of the Township of Tisdale, all of them being patented by the Crown in the name of the company as owner. As these claims adjoin each other they form a block of land that can be mined from one centrally located power plant. The present power plant and workings are so situated, being at about the centre of the block of claims.

The buildings consist of a power house and various commodious buildings for the accommodation of the men, office, smithy, storehouse, stables, etc. The power plant which is in good order and working steadily comprises two 60 h.p. boilers, 6-drill compressor, 3 hoists and all working connections.

The mining done up to the present includes 365 feet of sinking and 1,040 feet of drifting at the 100-foot level. The sinking comprises the main three-compartment shaft reaching to the 100-foot level known as No. 1 shaft, No. 3 shaft about 600 feet southerly reaching to the 100-foot level and connected at that level with No. 1, one intermediate shaft of about 65 feet in depth, and the winze about 100 feet northerly from the main shaft and reaching from the first level down 100 feet to the second level where the work of sinking at present ends (being

200 feet from the surface). All the ore raised from these workings is dumped and piled for conveyance to the stamp-mill.

The ore body consists of gold bearing quartz veins described on the Official Geological Maps and which are of varying and somewhat irregular widths. These veins out-crop in places but generally have been defined on the surface by trenching, the surface covering of soil and debris being in some cases several feet deep. Comparatively little, however, has been done in the way of uncovering known veins, or in prospecting for others, much of the territory being untouched. There appear at present to be three systems of veins running northeasterly and southwesterly across the property, and on what appears to be the main system the present workings are located. The width of the vein upon which the sinking and drifting has been done averages about from six to eight feet, and the length so far uncovered upon the surface is about 1,700 feet. The values throughout, according to the tests from sampling, assaying, and milling, have been fairly uniform without any apparent diminution at the depth reached (200 feet) where the vein still continues. Veins have been uncovered upon each of the four claims showing ore similar in character to that already mined and tested.

Consistent assay tests have been made from the commencement by means of a well-equipped assay plant and assayer on the property. In addition to this there have been the returns from the small two-stamp Tremaine mill, installed in the early part of the summer, the ore treated by it having been taken in the course of mining indiscriminately from the sinking and drifting.

The returns from the sampling and assaying have averaged $49.80 in gold per ton, while from the stamp-mill the values have averaged over $50.00 in gold per ton recovered from a saving of about 85 per cent. effected without concentration or effort to treat the sulphides, thus proving the free-milling character of the ore.

Under agreement with the company, mining operations are being vigorously carried on by the former owners and will be so continued free of expense to the company until the completion of the stamp-mill now being erected by the Procupine Gold Milling Company, Limited, in a convenient location on a site, a part of which has been leased from this company. Contracts have been let for the erection and equipment of this mill and it is fully expected that operations will begin by July next with electric power supplied by the power plant now being installed at Sandy Falls on the Mattagami River. Ore from this company's properties has the first claim to treatment up to the full initial capacity of the mill, viz.: thirty stamps. Thus the company, by the time the stamp-mill commences operations, will own, entirely free of cost to it, a fully equipped and efficient mining plant, a large quantity of ore mined and ready for treatment, a further large quantity of ore blocked out, with provision made for milling the ore, as a result of which financial returns should be quickly obtainable.

The Tremaine stamp-mill was installed to ascertain the gold content of the ore and its free milling character. The gold so recovered by this process, which is the property of the company, has not yet been refined and its value therefore cannot be stated, but a full report will be given later.

Mr. P. A. Robbins as General Manager will take charge on February 1st next, and will be assisted by Mr. A. A. Pare under whose superintendency the mining and milling operations have hitherto been conducted with great satisfaction.

N. A. TIMMINS, President.

LA ROSE.

The dividend cheques of La Rose Consolidated mines were mailed on January 21st. A brief statement accompanying the cheques shows that there is $708,470.99 in cash on hand and ore in transit and at smelters, and $303,343.40 in ore sacked at the mine ready for shipment. Since October 1 the available cash assets have been increased over 65 per cent.

January 20, 1911.

Cash in bank, ore in transit and at smelters.....	$708,470.99
Ore sacked at mine ready for shipment.....	303,343.40
	$1,011,814.39

The fact that the cash position has been trebled since April 20, 1910, and that the ore reserves are very much greater, reflects the new order of events at La Rose mining areas and emphasizes the executive capacity of President McGibbon and his co-directors.

STATISTICS AND RETURNS

COBALT BULLION SHIPMENTS.

January 14.

A shipment of bullion consisting of 17 bars and 1 keg silver left Cobalt on Wednesday afternoon through the Dominion Express Company. The 17 bars were billed through to St. John for conveyance by the C.P.R. steamer Empress of Britain to London (Eng.) The keg of silver was consigned to the American Smelting & Refining Company, Perth Amboy, New Jersey.

The details of the shipment are as under:

Temiskaming Mine—12 bars; weight, 13,840 ounces; value, $6,220.

Trethewey Mine—2 bars; weight, 1,952 ounces; value, $865.

Silver Cliff Mine—1 bar; weight, 832 ounces; value, $371.

Waldman Mine—1 bar; weight, 328 ounces; value, $140.

Campbell & Deyell's Sampling Works—1 bar; weight, 160 ounces; value, $66.

Kerr Lake Mine—1 keg silver; weight, 4,384; value, $1,258.

The bullion shipments for this year now read as under:

	Ounces	Value.
O'Brien	18,921	$10,217
Nova Scotia	80,177	40,000
Temiskaming	26,381	12,490
Trethewey	1,952	865
Silver Cliff	832	371
Waldman	328	140
Kerr Lake	4,384	1,258
Campbell & Deyell's Sampling Works	160	66
	135,135	$65,407

COBALT ORE SHIPMENTS.

Shipments from Cobalt camp for the week ended January 14th were 822,598 pounds, or 411 tons divided among eleven mines. Shipments since the year opened are 2,210,858 pounds or 1,105 tons. The details are:

	Jan. 14.	Since Jan. 1
Beaver		6,300
Buffalo	57,590	120,690
Cobalt Lake		131,400
Cobalt Townsite		63,700
Coniagas	61,820	288,620
Crown Reserve	40,200	104,200
La Rose	60,000	122,300
Kerr Lake	120,398	180,728

McKinley-Darragh	125,610	269,070
Nipissing	152,400	433,600
O'Brien	79,200	79,200
Right of Way	60,860	60,860
Silver Cliff	.....	47,920
Temiskaming	64,520	145,820
Trethewey	97,250	97,250

COBALT ORE SHIPMENTS.

Following are the shipments from the Cobalt camp for the week ending January 21, and those from January 1, 1911, to date:

	Jan. 21. Ore in lbs.	Since Jan.1. Ore in lbs.
Beaver	.....	63,500
Buffalo	63,980	184,670
Cobalt Lake	.....	131,400
Cobalt Townsite	.....	65,700
Coniagas	.....	288,620
Crown Reserve	.....	104,200
Chambers-Ferland	64,900	64,900
La Rose	153,310	275,610
Kerr Lake	120,165	300,893
McKinley-Darragh-Savage	110,430	379,500
Nipissing	124,280	557,880
O'Brien	.....	79,200
Right of Way	.....	60,860
Silver Cliff	.....	47,920
Temiskaming	.....	145,820
Trethewey	.....	97,250
Townsite	.....	184,040

The shipments for the week were 821,105 pounds, or 410 tons. The shipments from January 1 to January 21 were 3,031,963 pounds, or 1,515 tons.

BRITISH COLUMBIA ORE SHIPMENTS.

The following are the returns of the ore production and movement for the past week ending January 14th, and for the year to date:

Boundary Shipments.

Granby	19,894	44,553
Mother Lode	8,226	15,524

A Safe and Satisfactory Investment

The 7 per cent. Guaranteed Income Bond issued by the NORTH AMERICAN LIFE among other attractive features guarantees (when it becomes paid-up in 15 or 20 years) an income of 7 per cent. of the face amount of the Bond, or in lieu of this it provides for a handsome cash return,

The holder of Bond No. 13209 a prominent physician of many years' standing in a Western Ontario community, after drawing $570 cash surplus, is now receiving an annual income of $140. in connection with his $2000. Bond, which in addition is participating in the Company's surplus every five years.

The holder of Bond No. 9153, who is one of the leading educationalists of the Dominion, writing from Montreal under date of December 20th, says; "I am in receipt of your Company's cheque for $8,390. in settlement of my $5000 7 per cent Bond, which matured to-day. The total amount I paid in was $5965. and now I find you are able to hand me $2425. more than I paid, in addition to carrying my risk of $5000 for the last twenty years. In my opinion this result is remarkable, and should appeal to all thinking men.

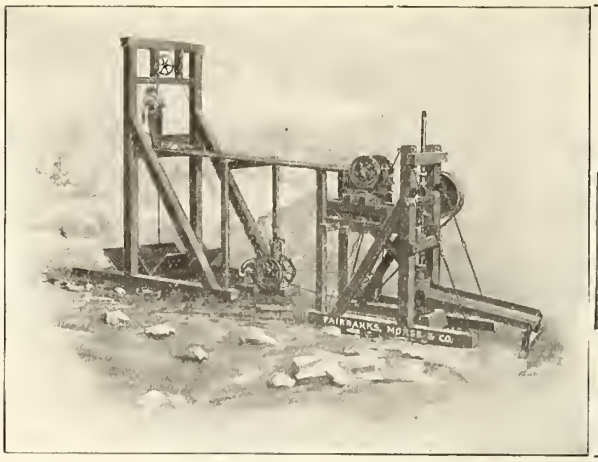
Prospector's Outfit

Fitted with NISSEN STAMP MILL



Nissen Mortar

A Boon to Prospectors

A simple, compact outfit, sturdy in construction and which is easily taken apart for transportation purposes. One man and a supply of gasoline is all that is necessary to operate the outfit.

It is fitted with a Fairbanks-Morse Gasoline Engine, which cannot be equalled for reliable continuous service. The stamp mill is a modern Nissen Stamp—the mill with largest capacity and smallest consumption of Power. Our Bulletin will tell you all about it. Send for it to-day.

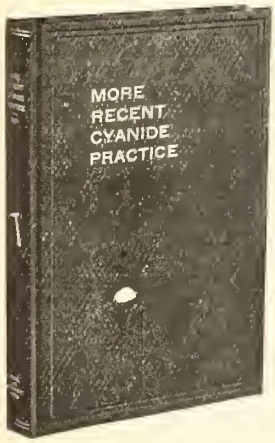
THE EXPERIENCE OF EXPERTS



More Recent Cyanide Practice

EDITED BY
H. FOSTER BAIN

424 Pages Indexed Illustrated

$2 POSTPAID

There is no information so valuable as the experience of the men who have designed, built, and operated notable mills, or the chemists and metallurgists who have solved difficult problems as they arose. This book contains articles by 82 men, among whom are the leaders in the cyanide industry. It is valuable as a handbook and together with the companion volume, 'Recent Cyanide Practice', makes an interesting compendium of the cyanide process.

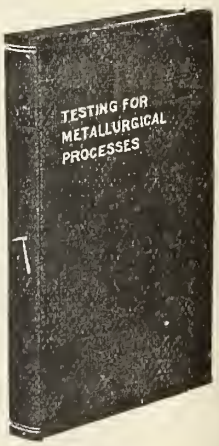
Testing for Metallurgical Processes



By JAMES A. BARR

216 pages
Illustrated
Indexed

$2 POSTPAID

This book is designed to assist in the selection of the process of treatment for any ore. The author describes the apparatus employed in making laboratory and small-lot tests. It is founded upon experimental work at the Michigan College of Mines, and the methods recommended have been tested in practice. It is brief and practical, equally valuable to the student and the practicing engineer.

Canadian Mining Journal, Toronto

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining gineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show as of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a rough knowledge of Mining Law, should be very careful with whom they place their business.

DEPARTMENT OF MINES. GEOLOGICAL SURVEY.

PUBLICATIONS

The Geological Survey has published maps and reports dealing wit a large part of Canada, with many local areas and special subject

A single copy of a map or report that is specially desired will be sent to Canadian applicants free of cost and to others at nominal price.

Most of the older reports are out of print, but they may usually be found in public libraries, libraries of the Canadian Mini Institute, etc.

A catalogue of publications will be sent free to any applicant. Reports that are out of print are indicated in the catalogue by dagger.

Applications for publications should be addressed to the Director, Geological Survey, Ottawa, and should state definitely t precise area concerning which information is desired. It is often of assistance in satisfactorily filling an order for a map or report, the applicant states the use for which it is intended. Letters and samples that are of a Departmental nature, addressed to the Direct may be mailed O.H.M.S. free of postage.

THE standard treatise in English on general metallurgy. It is of the highest value and greatest practical use to every metallurgist. The sections on Alloys, Measurements of High Temperatures, Slags and Mattes are very important.

The author is President and Professor of Metallurgy, at the South Dakota School of Mines.

The Main Chapter Headings Are:

I.—The Metals and Metallurgy from the Historic Point of View. II.—Physical Mixtures and Thermal Analysis. III.—Physical Properties of Metals. IV.—Alloys. V.—The Physical Properties of Alloys. VI.—The Measurement of High Temperature. VII.—Typical Metallurgical Operations. VIII.—Slags. IX.—Matte, Bullion and Speiss. X.—Refractory Material for Furnaces. XI.—Fuels. XII.—Combustion. XIII.—The Production and Heating of Blast Furnaces. XIV.—An Example Illustrating the Physics and Chemistry of a Melting Operation. The Blast Furnace for Copper.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals, extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The silver mines of the Cobalt district have astonished the world by their richness, and promising gold discoveries have recently been made in Porcupine Lake.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are: Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows:

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unsurveyed territory, is open to prospecting.

Miners' Certificates good for a calendar year may be obtained by sending $10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minimum being 40 acres in unsurveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of $10.00 plus a yearly rental of $1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed territory may be purchased as a mining concession at the price of $20.00 per acre if within 20 miles of a railway in a straight line, or $10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

The Hon. Minister of Colonization, Mines and Fisheries.
Quebec.

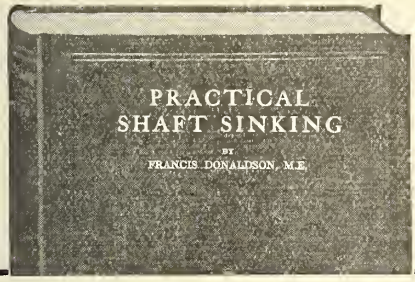
FACULTY OF APPLIED SCIENCE AND ENGINEERING

Courses in

1. Civil Engineering.
2. Mining Engineering.
3. Mechanical Engineering.
4. Architecture.
5. Analytical and Applied Chemistry
6. Chemical Engineering.
7. Electrical Engineering.

For Calendar and other information apply to the Secretary

A. T. LAING.



143 pages, 6x9, illustrated, $2.00 (8/6) net, postpaid.

A book treating in a practical way all the problems of shaft sinking under diverse conditions.

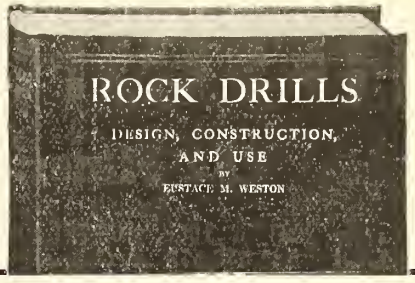
It has much material on the plant required, various methods of sinking, types and requirements of pumps, cementation, concrete linings, etc.

It is especially valuable *for its data on costs.*

Mr. Donaldson is chief engineer of the Dravo Contracting Co.

CONTENTS

Chapter I.—Some Deep Shafts—Features of Contracts for Sinking—Form of Contract. II.—Plant Required—Boilers, Hoisting Engines, Head-Frame and Bucket Air Compressors. III.—Sinking through Surface—Soft Ground—Wooden Sheeting—Steel Sheeting—Caissons of Steel, Wood or Concrete. IV.—Sinking through Soft Ground—Pneumatic Process—Shield Method. V.—Sinking in Rock—Arrangement of Holes—Tools and Methods used in Drilling—Costs and Speed. VI.—The Sinking-Drum Process—Mammoth Pump—The Freezing Process. VII.—The Kind-Chaudron Boring Process—Cementation of Water-Bearing Fissures. VIII.—Lifting Water—Horizontal vs. Vertical Pumps—Handling Pumps in Shaft—Cornish Pumps. IX.—Shaft Linings. X.—Concrete Linings—Costs per Linear Foot for Rectangular, Elliptical and Quadrilateral Shafts.



370 pages, 6x9, illustrated, $4.00 (17s) net, postpaid.

A treatise for engineers who have to select and use rock drills. It will prove a valuable handbook for all with problems in rock excavation.

Describes first the various types of rock drills in established use, their design and efficiency. It covers further the operation on the surface and underground with valuable chapters on practice in America, Australia and Africa. *It has important data on costs.*

CONTENTS

Preface. I.—Historical Sketch. II.—Standard Piston Drills. III.—Hammer Drills. IV.—Electric Drills. V.—Operating Rock Drills on the Surface and Underground. VI.—Piston Drills Designed to Use Air Expansively. VII.—Philosophy of the Process of Drilling Rock. VIII.—Repair and Maintenance of Rock Drills. IX.—Drill Steel and Drill Bits. X.—Explosives and Their Use. XI.—Theory of Blasting With High Explosives. XII.—Examples of Rock Drill Practice, Africa and Australia. XIII.—Examples of Rock Drill Practice, America. XIV.—Rock Drill Tests and Contests. XV.—Dusts and Its Prevention. XVI.—Notes on the Use of Compressed Air.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silve $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Mineral or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,0 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land h been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

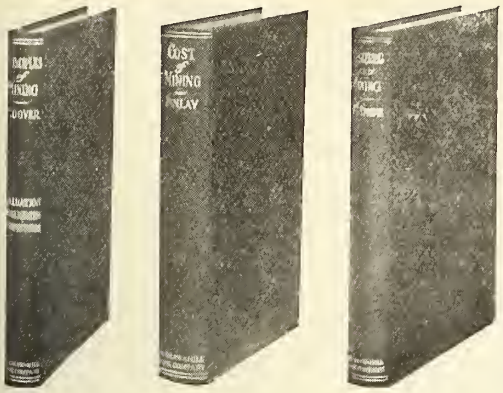
The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

HON. MINISTER OF MINES



The Three Most Important Mining Books of Recent Years

They Cover

PRINCIPLES—ECONOMICS—METHODS

Principles of Mining. By H. C. Hoover, $2.50 (10/6) net postpaid.

The principles of mining as developed by modern science and business methods are here fully discussed under the general headings of Valuation, Organization and Administration. Important chapters cover investment from the public's standpoint, and the character, training and obligations of the mining engineer.

Cost of Mining By James R. Finlay. $5.00 (21s) net, postpaid.

An economic investigation of the cost of scientific. profitable mining. It contains valuable data obtained from official reports of the mines producing 75 per cent. of the metal under discussion. Detailed analyses cover cost of mining *coal, iron, lead, zinc, copper, gold and silver.*

Timbering and Mining. By W. H. Storms, $2.00 (8/6) net, postpaid.

Deals with practical methods, not theories. A straightforward account of the best, safest and most economical methods employed in the leading American mines.

CLYDE PATENT WIRE ROPE WORKS

Rutherglen, Glasgow, Scotland

WIRE ROPES

For Winding and Haulage in Collieries and Mines, Aerial Ropeways, Transmission of Power, Suspension Bridges, etc. SPECIALLY FLEXIBLE ROPES for Hoists, Winches, Loading and Discharging Cranes, Shipping Purposes, Towing, Alligator and Dredger Ropes, etc. SPECIAL ROPE FOR LOGGING.

Our Ropes are made from wire drawn for our exclusive use, and are at work all over Canada. Messrs. Nova Scotia Steel & Coal Co., Ltd., who use them largely, write that one of our haulage ropes at their Wabana Mine has been in use for **5 years**, drawing over 1,750,000 tons and still in good condition. From the Atlantic to the Pacific they are well known and our agents will be only too pleased to give all information to enquirers. They may be had from the following, viz :

Nova Scotia : Wm. Stairs, Son & Morrow, Limited. New Brunswick : W. H. Thorne & Co., Limited.
Montreal and Toronto : Drummond, McCall & Co. Vancouver, B.C. : John Burns. Winnipeg : David Philip, Portage Ave.

HIGHEST Quality. MODERATE Price. Prompt Delivery. SATISFACTION in use.

Cables : "Ropery, Rutherglen." Codes : A. B. C. (4th and 5th Editions), A.I., Liebers and Private

NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

"WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. **It does not freeze,** or rather, explodes with perfect efficiency when frozen **and needs no thawing.**

"AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appearance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

PERMITTED EXPLOSIVES for Coal Mines
Nobel Monobel, Saxonite and Carbonite.

THE HARDINGE MILL IN PORCUPINE

WHY NOT?

Do YOU know that one $1,500 HARDINGE CONICAL MILL more than doubled the capacity of a $40,000 Plant and during 28 months of continuous operation has not cost ONE CENT for REPAIRS?

The HARDINGE MILL has caused FINE ROLLS, STAMPS, CHILI, HUNTINGTON and TUBE MILLS to be discarded. WHY AND WHERE? Do YOU want to know? ASK US. Also send for our Catalog B.

We can test your Ore in our New York Plant and deliver our Mills F.O.B. TORONTO.

Hardinge Mills are Patented and Built in Canada.

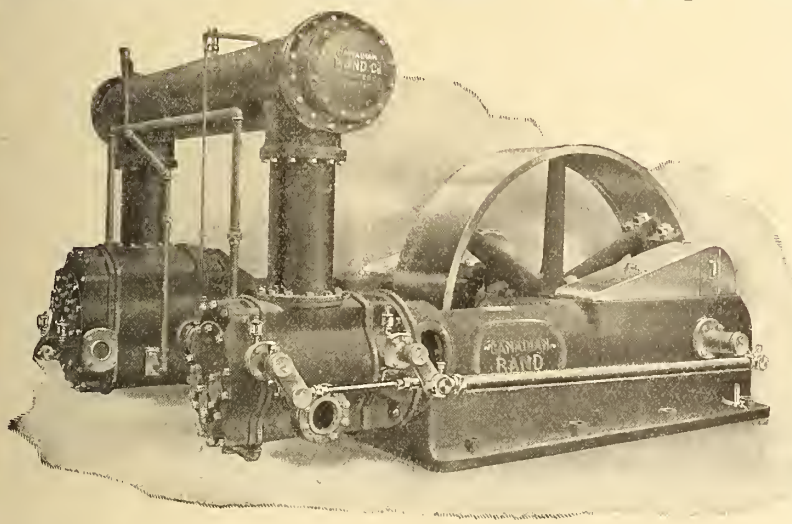
BEST FOR MINE BUILDINGS

Amatite has a genuine mineral surface.
This means that it requires no painting.
Contrast this with the fact that all ready roofings of smooth surface require painting regularly.
Figure out how much it costs you to paint the roofs of your mill, your shaft-house, repair shop and the other buildings?
Think of saving this amount not once—but three, four or five times—smooth-surfaced roofing requiring painting about every other year.
Amatite does not require any attention whatever after it is once laid.
Another point that recommends it to the Mine Manager is that it is easily laid and has galvanized nails and liquid cement in the center of each roll.
We can offer no more convincing argument in favor of Amatite than a sample of the roofing itself. The practical man recognizes its value immediately—its thickness, strength and durability.
We also have a booklet of facts. **Send your request for this free sample to the nearest office.**

THE PATERSON MANUFACTURING CO., LTD.

MONTREAL TORONTO WINNIPEG
VANCOUVER ST. JOHN, N.B. HALIFAX, N.S.

CLASS "RP-2" AIR COMPRESSORS



The Rand Class "RP-2." Duplex Power Driven Air Compressor combines the good principles of modern engine design with the best pneumatic practice.

The unusual capacity of Class "RP-2" Compressors is of course evolved through their high speed and high efficiency, but their massive enclosed dust-proof construction permits of high-speed without impairing the "Rand" reliability.

The superior quality of workmanship, rigid enclosed construction, exceptionally large bearing areas and efficient lubricating system which literally "floods" all important bearings, combine to give the high mechanical efficiency which characterizes this type.

Large free air ports, correctly controlled by improved Corliss Inlet Valves and "Imperial Cushioned High Speed Outlet Valves" insure highest compression efficiency.

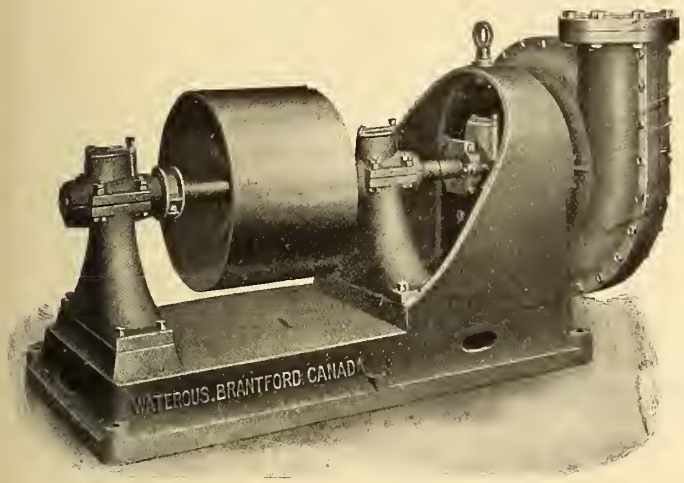
NOTICE
THE SPLIT-BASE
ITS NEW

The Waterous Pump
is built for Mine Work



It is simple in construction. It is built of few parts, there are no valves to get out of order, no restricted water-passages to clog up; there is not a complicated piece in its whole makeup.

It is built strongly throughout. Wherever wear is likely to occur the casting is re-inforced and strengthened to resist it. The materials used are selected, and the careful way parts are put together prevents wear and consequent slackness.

It is Easy to Operate. It can be left in care of an unskilled laborer without danger. All that is necessary is to start it running and to shut it off when the whistle blows. Overhauling and cleaning are made simple by the split-base and split packing gland—special features of this pump.

It is compact and comparatively light. It can be quickly and easily moved from place to place and will work well in almost any position.

The pumps are built in Horizontal and Vertical types. In sizes up to 14in. discharge opening. Are adapted for Belt, Engine or Motor Drive.

PROFESSIONAL ETHICS, WILD-CATTING, AND LEGISLATION.

For some weeks the Toronto branch of the Canadian Mining Institute has been holding special meetings to consider the repression of wild-catting. The aim of the branch has been to suggest the basis of restrictive legislation. Up to the present all attempts to draft a memorial embodying the views of the meeting have failed. Not more than a very few individuals concur in thinking any one specific restriction effective. This divergence is, of course, inevitable. And it signifies that we have been placing the cart before the horse.

In other words, the evil must first be defined, diagnosed, and isolated. Only then can we hope for some degree of unanimity as to the remedy.

What is wild-catting? To our mind wild-catting may best be defined as an attempt to sell mining shares to the public under false pretenses. Usually such attempts imply excessive capitalization, incomplete and exaggerated descriptions of the physical basis of the flotation, undue emphasis laid upon certain incidentals, and the repression of vital facts as to financial arrangements. Briefly, the subornation of the public press makes possible this evil. Paid reading notices, flashy advertisements, and faked despatches are the weapons that the press provides, at a price, for the wild-catter.

Our legislatures also are not blameless. Our legal machinery provides every facility for the wild-catter. He is permitted to foist the most vicious schemes upon the public. Not only is this true, but it is also true that he receives all necessary privileges without question and without a moment's investigation. Dummy directors and other expedients make it easy for anyone, be he bank manager or escaped convict, to call into existence millions of shares in corporations that are commercial nightmares.

Upon the legal luminaries who sell their services as organizers blame also rests. It is surely possible for the lawyer to draw the line somewhere. Precedent and professional habit may justify in some degree the impersonal attitude of the legal adviser; but it is going too far to claim that any professional can so reconcile the evident conflict between morals and business as to feel no compunction in helping to launch companies that are conceived for the express purpose of robbing fellow citizens.

The small investor himself is not clear of blame. Animated by cupidity he eagerly gulps down the baited hook. And when the barb strikes he complains to the world at large of the hard usage that has been accorded him.

But, since wild-catting is done in the name of mining, and since the welfare of the industry and the honour of the profession are affected by it, it assuredly is the first duty of the mining engineer to do all that he can, privately and publicly, to discountenance unsound projects. In the main, the mining engineer is far too diffident in this direction. Often, we regret to say, he is even complaisant. Though his report be put to ill-uses, he contents himself with shrugging his shoulders and maintaining a discreet silence. Here, specifically, professional ethics must be revamped. We have no patience with a negative scheme of ethics. The professional mining engineer, to fulfil his functions as a citizen, to do fairly by the clients who employ him and by the public that trusts and respects him, must be positive, constructive, and aggressive. In season and out of season he must condemn the spurious.

Not all the resolutions in the world can have as strong an influence as the openly expressed opinions of responsible individuals.

Wild-catting is only one manifestation of a prevalent disease. It is not to be cured by patent medicines nor by the knife. But it succumbs readily to open-air treatment.

THE TARIFF.

Although mining interests are not directly concerned with the free exportation of pulp wood, yet indirectly the question is fraught with large meaning for them. The manufacture of sulphite pulp in Canada implies the exploitation of our iron pyrites deposits and the local manufacturing of sulphuric acid. In the mining of iron pyrites there is not a large profit. In the manufacture of sulphuric acid there is a large profit. But the market is limited, and is susceptible of expansion only as our home industries grow. The demand for sulphite-pulp is expanding. If we consent to ship our crude pyrites to the United States, and also to ship our pulp-wood there, we are by way of losing all but nominal profits and of denuding ourselves at a rapid rate of natural assets that are yearly becoming more valuable.

As regards legislative control, it is to be noted that only the Federal Government can prohibit the exportation of pulp-wood from privately owned lands. Provincial Governments can forbid the exportation of pulp-wood from Crown lands only. Thus, whilst the Dominion Government has shown its willingness to remove all barriers, the Provincial Governments are still competent to prevent the wholesale destruction of our pulp-wood forests.

This is but one example of the complicated relations that obtain in mining, milling, and marketing any given mineral. How far Canada is prepared to make concessions is a matter for our plenipotentiaries to determine. Any concession that it is possible to make, so far as mining is concerned, is limited by the volume of trade now existing in one or all of certain specified mine products. Or, rather, these concessions are limited by the probable expansion of trade indicated by the tariff revision.

But since this revision is provisional entirely, and is dependent for effectiveness upon the consent of astute but temporizing politicians, let us rather say that upon the confirmation of this revision rests the expansion of our mineral trade.

Genuine reciprocity, which is to be sharply distinguished from reciprocity as arranged in view of political exigencies, will give certain of our natural products a much better status. For instance, gypsum might be manufactured in Canada for all Canada east, and for the eastern consumers of the United States. But this cannot be unless we are put on absolutely equal terms with United States producers.

It were useless to multiply instances. The basic principle remains. We are bound to retain in Canada the ultimate profit from our products. They must be turned over to our customers in as finished a condition as possible. This is the whole meaning of the tariff to us. Sentiment can be disregarded. We are all British. But, also, we are all merchants. We must sell our commodities, whether they be brains or pork, in the best market. The historic fact remains that heretofore all of our bargains with the United States have been expensive for us. Let us calmly and coolly decide whether this bargain is or is not to our advantage. If it is to our advantage, then we shall be so much the bigger factor in the Imperial Federation.

THE YUKON IN 1910.

In length the past dredging season has exceeded that of any previous year. Beginning in April, dredging was continuously carried on until December 13, a period of 233 days. The output of gold was greater by half a million dollars than in 1909. Operations have been measurably cheapened during the past twelve months both by the installation of larger dredges and by the distribution of electric power.

The output of 1909 was valued at $3,560,000; that of 1910 aggregated $4,100,000. To this enhanced yield the dredges of the Yukon Gold Company on Bonanza and Hunker contributed most. It is confidently expected that the coming season will witness a very much larger growth from this company's dredges and giants.

The Treadgold interests are now prepared for a vigorous campaign on Last Creek, Dominion Creek, parts of Quartz Creek, and possibly other streams. The huge power ditch is practically finished, and distribution lines are in place.

The Canadian-Klondyke Company, on the Boyle concession, below Bear Creek, had a successful season. Other companies are operating on Fortymile, and on Stewart.

All things considered, it looks as if Yukon can fairly look forward to the coming season with a well-grounded expectation of touching the six million mark.

The agitation for good roads in the Yukon should bring relief to many operators. It may be noted, incidentally, that rapid time has already been made in a motor-car between Whitehorse and Yukon Crossing.

In Southern Yukon preparations are being made to provide for the shipment of large quantities of copper ore from Whitehorse to Skagway, thence to the Tacoma smelter. Iniquitously high railroad freights have heretofore paralyzed this enterprise. The action of the Railway Commission in cutting down these rates has relieved an intolerable situation.

Coal-mining has been active. As it reflects directly the condition of the dredging industry, it will almost certainly prosper.

* * * * *

The conviction that the Yukon is no longer a poor man's country may require qualifying. Whilst there is no questioning the fact that the greater part of the country's annual wealth will be won by large and highly organized corporations, yet we are inclined to believe that the enterprising prospector still has a good chance to attain success. The Yukon is fast becoming a stronger factor in our national economy. There will be prizes for more than a few in the successful exploitation of so vast a region.

THE IRON ORE RESOURCES OF THE WORLD.

The eleventh International Geological Congress assumed the task of estimating the present developed and partly developed iron ore resources known to-day. The total aggregate weight of iron ore is estimated by that body as being 22,408,000,000 tons. This quantity is calculated to represent 10,192,000,000 tons of iron.

Despite the magnitude of these figures, it appears to be a fact that at the present rate of output this supply would last for less than two centuries. The present rate of output, of course, will increase almost geometrically, the demand for iron and steel products being a function of our civilization. Therefore the visible supplies of iron ore are all too meagre to meet the requirements of future generations. One evidence of this is the enormous consumption of structural steel in large buildings. Another is the fact that our mercantile marine is almost altogether built of steel.

The total iron ore output of the world in 1908 was 113,000,000 tons. The figure for 1909 was probably much larger, and the returns for 1910 will indicate a corresponding increase. Meanwhile it is interesting to note that the actual resources of the United States are estimated at four and one-half billion tons, those of Germany being calculated at 3,877,000,000 tons. The United States possible yield of metallic iron is calculated at 2,305,000,000 tons; while the German yield is only 1,360,000,000 tons of iron in an almost equivalent amount of ore. Other countries fall far behind the United States and Germany in undeveloped resources; but the United Kingdom is the principal other contributor to the reserves mentioned.

Any estimate of this kind must naturally be based upon scanty knowledge of the undeveloped resources of this continent. There is little room to doubt that we have large unimproved iron deposits. There is even less room to doubt that we have not spent a fraction of the money necessary to develop them. If we take the Lake Superior country as a criterion, then we must spend at least ten to twenty times more in prospecting than we have done. If we do this we have some hope of success. If not, we are immediately relegated to the blank background of failure.

SCOTTISH MINERAL OIL DURING 1910.

In view of probable future developments in New Brunswick, a glance at the present status of the Scottish shale-oil industry is timely. The long and successful struggle of the Scottish operators against the Standard Oil Company, a struggle of pygmies against a titan, strengthened and consolidated the former.

In earlier years the Scottish producers depended solely upon the sale of burning oil. During their fight with the Standard people, the production and marketing of vastly more valuable by-products developed rapidly.

At present the Scottish companies produce about 22,000,000 gallons of lamp oil per annum. In disposing of this large quantity there is, apparently, little difficulty. Of course the price per gallon is exceedingly low. But the strong demand for by-products compensates for this fact. And, although paraffin is being used less and less as an illuminant, as a fuel its use is growing consistently.

Amongst the important by-products, paraffin wax has suffered from competition with the American and Galician products. So also have lubricating oil and gas oil. But sulphate of ammonia, naphtha, and motor spirits have been sources of great profit. The first mentioned by-product, sulphate of ammonia, is produced to the extent of 70,000 tons per annum. When the price per ton exceeds $65, the margin of profit is substantial.

As several of the oil-shale companies pay fifty per cent. annual dividends, and others yield returns almost as large, it will be admitted that the position of the industry is strong. However, there have been numerous failures, and the success of the industry generally is directly attributable to most careful methods, constant search for new markets, and high moral courage.

We believe that the oil-shale deposits of Eastern Canada can be worked successfully. A longer period of probation may be necessary. But in situation, extent, and richness, our own deposits have many marked advantages over those of Scotland.

The tin market stands at about £180. This in itself is a very encouraging feature. But as the visible supply of tin is diminishing, there is room for the Canadian prospector to be almost unduly encouraged. Tin is really worth more than gold if you find it in sufficient quantities.

THE CROWN RESERVE REPORT.

With a total output of nearly ten million ounces of silver to its credit, the Crown Reserve mine of Cobalt has had a singularly prosperous career. During the last calendar year the mine output was 3,248,196 ounces, worth $1,757,821.27.

An analysis of the cost of silver per ounce is particularly interesting. The items of freight, treatment, smelter charges, and marketing, aggregate 3.89 cents per ounce. Head office expenses, depreciation, and insurance amount to 1.52 cents. Mining, development, ore handling and all other expenses total 6.56 cents. Thus the grand total cost per ounce of silver is 11.97 cents. Over the year the net profit per ounce was 42.13 cents, a total mine profit of $1,368,123.79. This amount, as is pointed out in the report, is equivalent to 77.34 per cent. of the value of the dividend paying stock.

The high-grade ore contained on the average 3,611 ounces per ton; the low-grade 103.5 ounces. The average of the two was 1,148.2 ounces, or $621.18.

Whilst the ore reserves are not estimated, enough general information is included to point to satisfactory conditions in the mine. Possibly it is the path of wisdom to omit close estimates; but the gap is one that demands some explanation.

It is evident that the mine will depend to a larger degree in the future upon low-grade ore. The large milling dump is being added to at the rate of 50 tons per day, mostly ore that contains about 20 ounces of silver. But the diminution in output of high-grade will be slow, if we may judge by the past.

Incidentally, the record of the Carson vein at the 100-foot and 200-foot levels is astonishing. About 6,840,000 ounces have been mined from this vein since it was opened.

The probable erection of a mill, or the placing of a milling contract with a customs concentrator, is foreshadowed in the general manager's concluding remarks.

CHANGES IN QUEBEC MINING LAWS.

Two amendments to the Quebec Mining Law are being introduced. The first of these provides that mining lands for which letters patent have been issued are sold after July, 1911, they will remain subject to a tax of ten cents an acre when they are not being worked. This corresponds to the British Columbia tax of 25 cents on unworked Crown-granted claims. It will enable the Crown to take possession anew of abandoned mining claims the owners of which are not to be found.

More important is the second amendment. This provides for a reduction of the yearly rental on mining claims under mining licenses. The present rate of $1 per acre is to be reduced to 50 cents. A qualifying clause demands 25 days' work during the first six months, and the same amount each successive year, dating from the expiry of the first six months.

Both amendments are sound. Both could be made more stringent without doing any harm to the industry. For instance we do not consider excessive a tax of one dollar an acre on unworked claims. Neither would 50 days' work annually be oppressive.

EDITORIAL NOTES.

The annual report of the Trethewey Silver-Cobalt Mine, Limited, appears just as we are going to press. We note that the net revenue for 1910 is $237,800.42 an increase of $37,992.78 over 1909. Of high-grade ore there were 155 tons produced, the average silver content ranging from 2,096 ounces per ton to 3,070 ounces. Low-grade ore to the amount of 164 tons was produced. The silver tenor of this material was 168 ounces per ton. High-grade concentrates, of which 254 tons were put out, carried an average of 1,630 ounces per ton. The average mill extraction was 86 per cent. on ore carrying 27 ounces per ton, a fine record for a new mill.

It is a remarkable fact, one that should have commercial significance, that throughout the gold mining regions of Nova Scotia, there is not a district wherein sufficient available water power does not exist to operate adequate mining work. This condition has been very largely overlooked.

OBITUARY.

George C. Tunstall died recently at Kamloops, British Columbia, after a residence in that Canadian Province of nearly half a century. He has born in New Jersey on December 5, 1836, and was educated at Sparkman's Academy, Sorel, and Lower Canada College, Montreal. When but 25 years of age he travelled west across the Canadian prairies, in company with others, now well known and honoured pioneers, arriving in British Columbia in 1862. In 1863 he proceeded to Cariboo, where for a number of years he was engaged in placer mining. In 1879 he was appointed Provincial Government agent at Kamloops, Yale district, and in 1885 received the appointment of Gold Commissioner for Granite Creek, Similkameen, where a discovery that year of coarse gold resulted in the biggest rush that district has ever seen. Five years later—in 1890—Mr. Tunstall was removed to West Kootenay district, with headquarters at Revelstoke, on the Columbia River. Subsequently he was retransferred to Kamloops, where, until 1909, he was Gold Commissioner for the northeastern portion of Yale district. Since his retirement from office his precarious health necessitated his seeking relief in change of climate, and it was only about a fortnight before his death that he returned from California. Although in his 75th year, the news of his death came as a shock to many of the friends his sterling good qualities and genial disposition had won for him during his long residence in the Kamloops district.

Microscopic Examination of some Typical Specimens of Porcupine Rocks and Vein Matter.

(Written for the CANADIAN MINING JOURNAL by JOHN STANSFIELD, Department of Geology, McGill University, Montreal.)

[Editor's Note: The following article was prepared for the CANADIAN MINING JOURNAL by Mr. John Stansfield, of the Department of Geology, McGill University. The hand specimens from which the slices were prepared were selected by the Editor, under the guidance of Mr. Myles Flynn, through whose kindness it was possible to secure a representative lot. All the specimens were taken from the Vipond mine, largely for the reason that on this claim nearly all the characteristic types of ore and country rock are to be found within small compass.

Whilst each microphotograph has its own particular significance, the general conclusions adduced by Mr. Stansfield are noteworthy. That the carbonates are older than the quartz is demonstrated. That the quartz is of igneous origin is indicated. The presence of feldspar shows a relation of the vein matter to aplite, and, as Mr. Stansfield points out, the presence of tourmaline tends to confirm the idea of the igneous origin of the vein matter.

Another fact adduced may be of decided moment. The gold and pyrites were evidently of contemporaneous origin, although some of the gold was deposited at a period later than the pyrites.

We hope that the article will arouse discussion, and that our Porcupine readers will send in comments freely. The co-ordination of facts observed in the field and in practical work, with conclusions drawn from laboratory research, is of the highest importance. Therefore we particularly request comment upon the material presented herewith.]

Pure Ankerite, No. 2 Vein.

A dark, bluish gray quartz band, bearing pyrites, cutting a dark brown carbonate, stained by limonite. The carbonate is siderite, bearing traces of calcium and magnesium. By weathering it is partly altered to limonite. The quartz vein is accompanied by a vein of ankerite. A slice of the quartz-ankerite vein shows dirty carbonate—the ankerite cut by thin veins of clear carbonate, and also by veins of coarsely and finely granular quartz, which has liquid inclusions containing gas bubbles. The carbonate is also found scattered through the quartz veins, but especially at their edges. A few crystals of pyrites occur in the ankerite and often have a little quartz in contact with them.

A slice of the dark brown carbonate shows yellow siderite cut by a vein of quartz. The quartz is usually coarse in grain and full of liquid inclusions, which have gas bubbles, some of them being in motion. The quartz contains some of the siderite in a clouded condition. Some of the quartz grains have a slight chloritic film round them. The siderite is finely granular and towards the quartz vein becomes more and more clouded with a fine dark brown dust, becoming almost opaque at the edge of the vein. The clouding is due to the production of limonite, which appears to be directly connected with the introduction of the quartz vein. Some small quartz grains are found distributed through the siderite.

No. 3 Footwall Pay Streak—Pit 300 Feet East of Ward Pit.

See Fig. I.

White quartz with dark green richly pyritic bands, some narrow bands rusted and showing free gold. Some surfaces show chlorite-sericite schist development.

The mass of the rock is quartz which is shot through in all directions by carbonates and fine-grained quartz and also by more definite veins characterized by fine-grained quartz, pyrites, chlorite and sericite. The

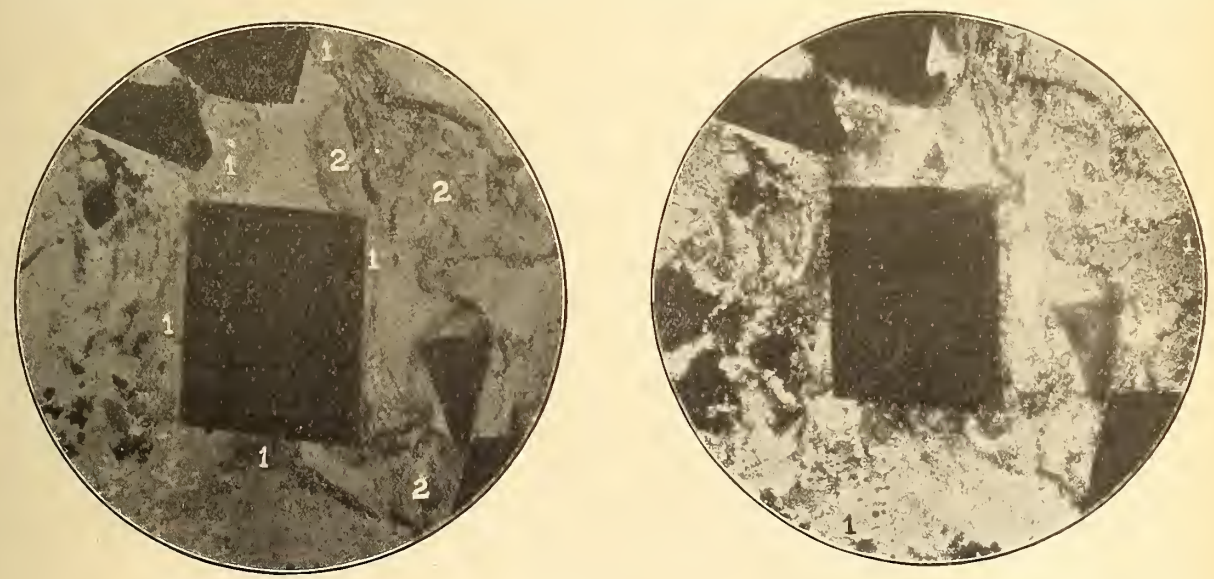

Fig. I.

1. Chlorite. 2. Sericite. Nicols. 1. Quartz.

Shows films of chlorite wrapping round pyrites crystals in a rim of sericite in quartz.

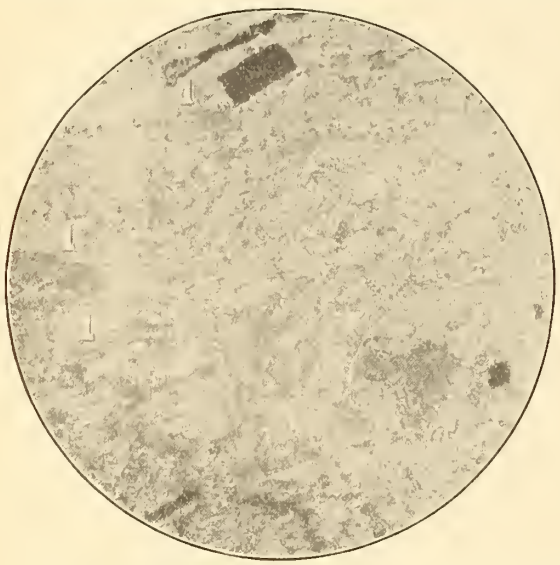
sericite and chlorite are usually seen wrapped round the pyrites crystals, which are large and well-shaped. The carbonates are dirty and are often iron-stained. The quartz grains sometimes have films of chlorite between them and chlorite is seen through the slice outside the veins, but in small amount only.

Vein Matter—Green is Characteristic of Whole District, Only Associated With Carbonates.

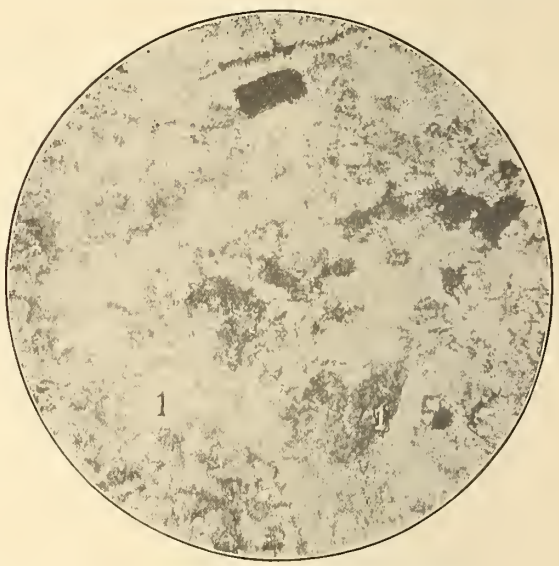
See Fig. II.

Gray banded rock, bands of bright green often associated with pyrites, bands of yellow carbonate and bands of quartz. Some surfaces are slimy, suggesting sericite.

The rock is rich in carbonate and in quartz. Pyrites in large irregular masses is developed along bands. The



1. Sericite Bands.



Nicols. 1 Twinned Feldspar

Fig. II.

Shows development of sericite bands in quartz. Two feldspar crystals (oligoclase) are shown. The dark line shows its upper boundary.

green matter is chlorite which is developed along bands and always associated with sericite in greater or less quantity. The chlorite shows a slight pleochroism, from green to yellow. A considerable quantity of feldspar occurs, including both orthoclase, with twinning on the Carlsbad law, but more frequently plagioclase, twinned according to the albite law, and some laths untwinned. The plagioclase is of a basic oliogoclase variety. (Extinction angle 16 deg.)

The rock appears to be an altered igneous rock which has been impregnated in all directions by carbonate and quartz. It would appear to have been originally of the nature of an aplite. There is nothing to indicate what was the original mineral from which the chlorite is formed. The sericite, at any rate in part, is derived from feldspar.

Green for Identification.

White quartz with green patches. The pyrites occurs in small amount in the green patches. It is now much altered, giving rise to brown iron-staining. A little free gold seen at one point on one of the green veins.

The rock consists of quartz in coarse grains showing strain shadows and very many liquid and gas inclusions. Five grains occur only in very small amount. Carbonates occur as interstitial patches and as thin films between quartz grains. Chlorite occurs interstitially usually associated with carbonates. It has a faint greenish colour with very faint pleochroism and is nearly isotropic.

Tourmaline needles of a bluish gray or brownish gray colour are found with arrangement in strings parallel to their length.

A few small patches of gold occur in association with interstitial carbonate and one small crystal of pyrites with interstitial carbonate, chlorite, iron oxide, the latter produced by weathering.

The green is chlorite and tourmaline with a predominance of the former.

No. 3 Vein—Banded Smoky Quartz—Ward Pit West.

See Fig. III.

Quartz rock with darker and lighter bands and thin bands rich in pyrites, with some softer talcose bands. The hand-specimen shows considerable free gold, which always occurs in connection with the pyrites bands, but just outside them.

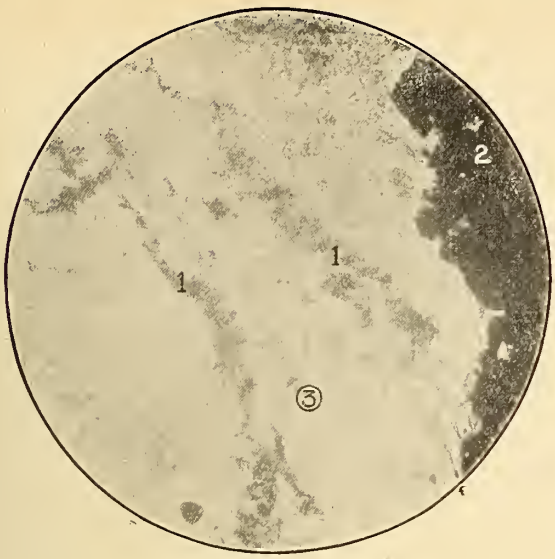
The rock is made up of quartz for the main part, which occurs in coarse and fine grains, chiefly the latter. Some of the grains are elongated and placed with their lengths perpendicular to the faces of pyrite crystals, which often exhibit this phenomenon on all four faces, which are seen in the slice. The quartz is full of liquid inclusions, usually with a gas bubble inside the liqnid. The larger grains show strain shadows. Pyrites in large irregular masses is developed along bands, as are also sericite, carbonate and tourmaline. The tourmaline occurs in small pleochroic needles and is only small in amount. Sericite is more important in amount and forms streaks through the quartz often with no other mineral in it, in other places associated with quartz and carbonates. Carbonate is found scattered throughout the rock.

No. 2 Vein—Banded Quartz and Schist With Sulphides —Fairly Rich in Gold.

See Fig. IV.

A dark-coloured banded quartz-chlorite schist, the quartz and chloritic bands being very distinct. Contains a little pyrites. A fresh fracture shows the greenish colour of the chlorite.

Section shows banded structure and consists of quartz, carbonate, chlorite, sericite, pyrites, and a little tourmaline, in that order of importance. The minerals are arranged in bands and various associations are



1. Tourmaline Bank. 2. Pyrites. 3. Sericite Bank.

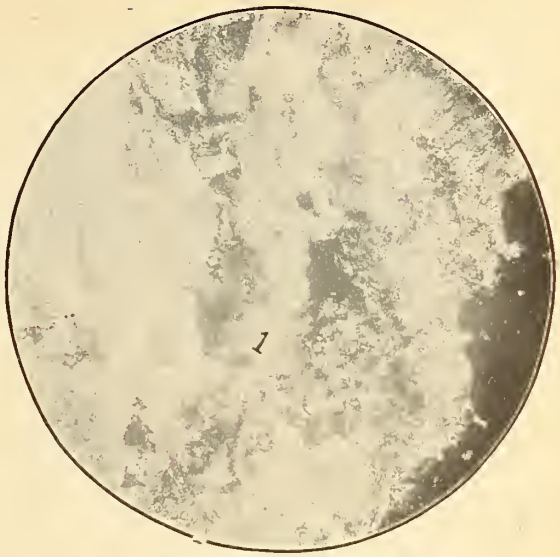


Fig. III. Nicols. 1. Sericite.
Shows parallel development tourmaline bands on each side of a sericite band, and of pyrites.

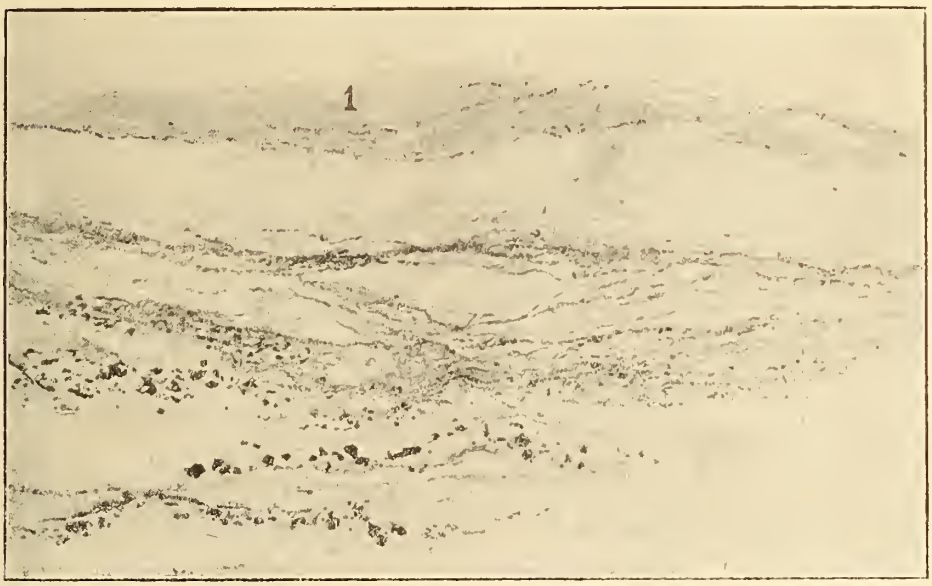

Fig. IV. 1. Carbonate Band. Shows Banded schistose structure with pyrites in bands. The dark streaks are rich in chlorite, the lighter ones in carbonate.

found, e.g., bands of sericite with tourmaline, of chlorite and sericite, with or without pyrites, of quartz with no other mineral, and so on. The quartz occurs as eyes and is finely granular. Carbonate is found scattered throughout the rock in addition to its parallel arrangement in bands.

The chlorite is in places of a deep green colour for chlorite, and at the same time with more marked pleochroism, from green to yellow, with low birefringence and extinction parallel to the lengths of the fibres.

Mixed Sulphide and Ankerite From No. 3 Vein—Gold-Bearing.

See Fig. V.

A gray carbonate rock with much quartz and very rich in pyrites. In some parts it has bands of a talcose schist.

The rock is composed of dirty carbonate in which pyrites is very richly disseminated. It is usually accompanied by quartz which is also scattered through the carbonate. There are quartz veins cutting the carbonate. The pyrites often has good crystal outlines, but also ragged outlines. The quartz veins are not rich in pyrites, but the largest crystals occur there. The quartz crystallized in contact with pyrites often shows elongated shapes, the grains being set with their length perpendicular to the faces of the pyrites crystal. The quartz is rich in liquid inclusions, which often have a gas inclusion in them. A small quantity of sericite occurs and is generally found in association with the quartz-pyrites nests, often in direct contact with the pyrites. One small piece of green chlorite occurs surrounding a small crystal of pyrites.

No free gold occurs in the slice.

One or two crystals of the feldspar occur in the calcite. It is an oligoclase showing an extension angle of 12 deg.

Fig. V.
Veins of quartz cutting carbonate, with rich development of pyrites in carbonate. Largest pyrites crystals are in quartz vein.

and chlorite indifferently, most often as a dirty dust.

Black Dolomite From No. 2 Vein Footwall.

A black carbonate rock with siliceous appearance. It has small bands with development of sericite schist.

The rock is composed of carbonate with a very little quartz in small interstitial grains.

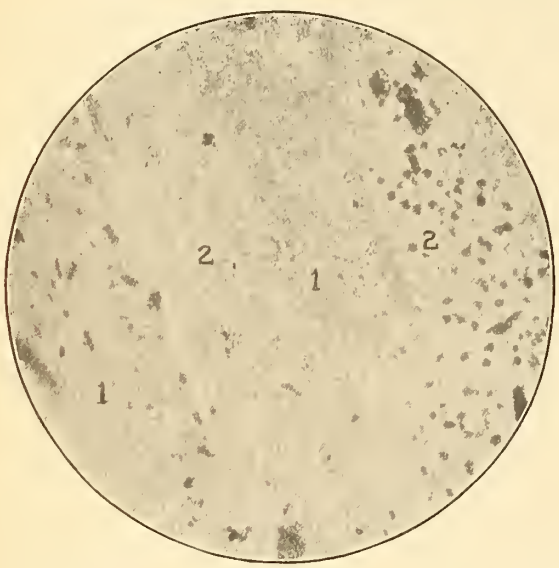
The carbonate is for the most part finely granular, some bands showing very coarse grain. The whole rock shows banded structure which is marked by small bands of fine opaque dust, or by difference in the size of the grains.

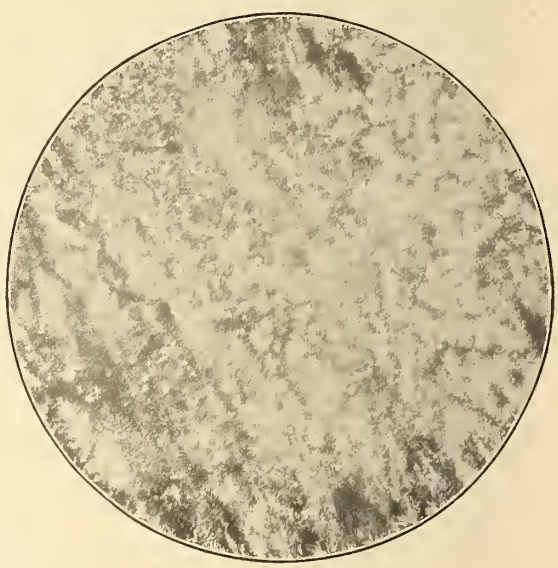
The structure indicates considerable movement since the formation of the carbonate. The occurrence of coarse-grained patches along one of the bands confirms this. At one part this shows intense crumpling and folding on a small scale with granulation of large crystals of carbonate.

Characteristic of No. 3 Vein—Constitutes From One-third to One-quarter of Vein Matter.

See Fig. VII.

A banded rock rich in quartz consisting of pure quartz bands and other bands containing sericite, some of which are very rich in pyrites. It consists for the most part of granular quartz, the grains being of two sizes, coarse and fine grains. Strain-shadows in the larger grains indicate strains due to differential pressure subsequent to the formation of the veins. All the





1. Green Chlorite. 2. Colorless chlorite. Fig. VI. Nicols
Shows banding of chlorite schist and occurance of opaque dirty patches.

Fine and Coarse Amygdaloidal Basalt.

See Fig. VI.

A dark green rock approaching a chlorite schist. It has well-marked parallel structure and has elongated amygdales which are filled with carbonates.

The rock is composed of chlorite and carbonate. The carbonate fills up the elongated amygdales, passing into bands. The chlorite is banded and of two varieties, one almost colourless and the other deep green with strong pleochroism (olive green to greenish yellow), and with higher birefringence than is usual in chlorite. It corresponds in characters to clinochlore. The bands are characterized by varying amounts of the two varieties of chlorite and also by sericite, which is also found in bands, but in subordinate amount.

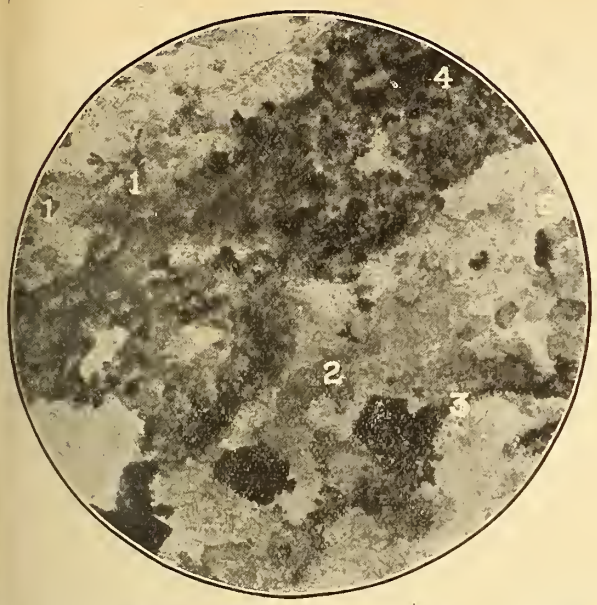
The rock is rich in dark patches of indeterminable matter, in some cases quite opaque, by white or reflected light. It has rough shapes and occurs in the calcite quartz is rich in liquid inclusions, which usually have a gas bubble inside them. Carbonate is distributed through the slice in considerable amount. The work has a banded structure, the bands being marked by the development of tourmaline, pyrites, carbonate and sericite, sometimes some of the components being absent. The tourmaline occurs in small needles, colourless or greenish-brown, with a distinct pleochroism.

The needles have parallel arrangement along the direction of the banding.

The pyrites occurs in small crystals and less often in large patches with irregular shapes, in the veins.

Sericite is found in certain of the bands being associated with tourmaline.

A very little green chlorite occurs in the veins and just outside them. There is also a certain amount of opaque indeterminable matter in the bands.



ig. VII. 1. Carbonate in quartz. 2. Chlorate. 3. Tourmaline· 4. Tourmaline with pyrites. 5. Quartz with carbonate. Shows a tourmaline band rich in pyrites with large crystals along parallel band.

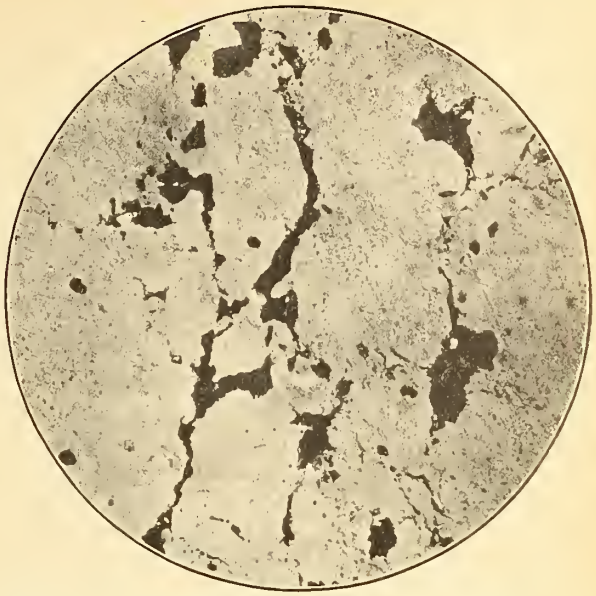


Fig. VIII. Stringers of gold in coarsely crystalline quartz.

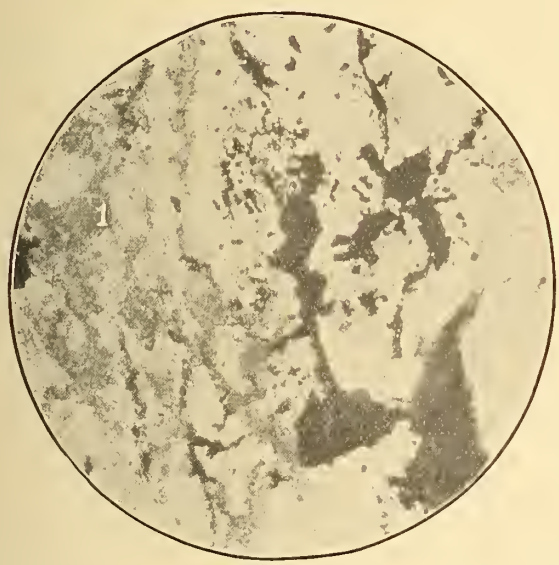

Nicols

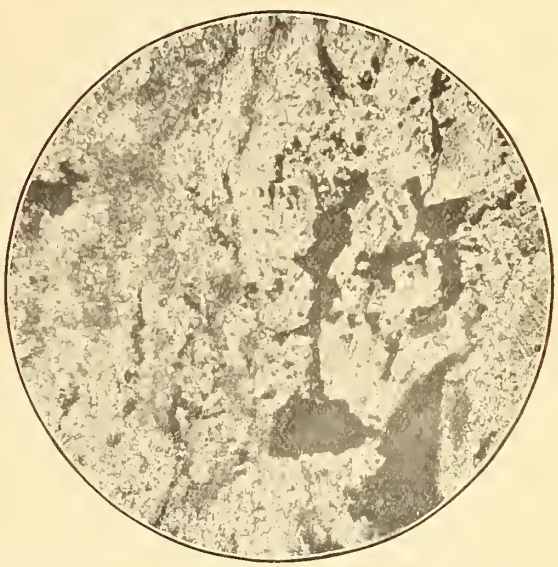

Fig. IX. 1. Carbonate.
Pyrites and gold in quartz carbonate vein, Pyrites wrapped round by gold. Quartz finely granular.

urface No. 3—300 Feet East of Ward—(Deep Pit). See Fig. VIII.

A brown stained, honey-combed quartz gossan with a onsiderable amount of free gold showing.

The rock is an almost pure quartz of very coarse rain, but with small interstitial granules. The quartz s full of liquid-gas inclusions. Brown stains of iron xide are common between adjacent grains.

A little interstitial chalybite or iron-stained carbonate ccurs and is often very dirty.

Gold occurs in considerable quantity either in string- rs in the quartz or in specks and stringers with dirty arbonate in the quartz. Only a very few crystals of yrites occur with dirty carbonate. One such crystal as gold partly wrapped round it.

One small patch of chlorite occurs.

A few crystals of feldspar are scattered through the ock. They are of a basic oligoclase (extension angle 16 degrees and optically negative) and show albite twinning.

The occurrence of feldspar suggests affinities to an aplite vein.

No. 3—Smoky Streak—on Footwall at Pit 200 Feet E. See Fig. IX.

Banded quartz with dark bands rich in pyrites. Free gold, chiefly in the clear quartz just outside the dark bands.

The rock consists of quartz and carbonate, the former predominating. The quartz occurs as coarse and fine grains, chiefly the latter. The large grains show strain shadows. Inclusions of liquid and gas are very numerous.

Veins of pyrites associated with tourmaline quartz and carbonate run through the rock, the tourmaline in parallel needles and the pyrites in good crystals, but chiefly in irregular bunches of crystals, is present in large amount. A little sericite is found along with

tourmaline in some of the veins, but is not important in amount. Still less abundant is green chlorite.

Gold is associated with the pyrites in some of the veins and its relation to the pyrites is brought out by examination by reflected light. The gold occurs in stringers and small specks in the vein and in addition is found in contact with pyrites, being always deposited on a crystal face of the pyrites, or partly wrapped round the crystal.

Most of the gold occurs in irregular bunches and only a few individuals show crystal shape.

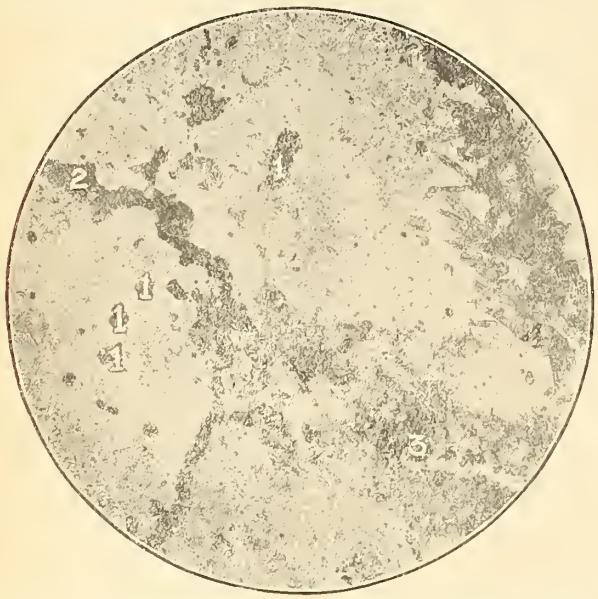

Fig. X 1. Pyrites. 2. Gold Stringer. 3. Opaque calcite. 4. Tourmaline needles. Parallel band of Tourmaline needles and stringer of gold in quartz. Crystals of pyrites.

A little distance from the vein at one point small pyrites crystals and small gold particles occur along parallel cracks, their appearance suggesting contemporaneous deposition.

Opaque indeterminable matter occurs in some bands.

No. 3 Centre of Vein—Deep Pit at Bottom—Green to be Identified.

See Fix. X.

A white quartz with green bunches and streaks rich in pyrites and with free gold showing at the edges o the patches and outside the edges of the veins.

A quartz vein with a fair amount of interstitial ca bonate. The quartz grains are both coarse and fin chiefly the former, and showing strain shadows an very many liquid inclusions with gas bubbles. Th carbonate, in addition to forming a cement, in man parts of the rock is seen running in straight and na row veins straight through quartz grains. A litt sericite is found associated with the interstitial ca bonate.

Pyrites, carbonate, and a few small tourmalin needles of a greenish-gray colour are developed t gether, occasionally with a very little sericite and chlo ite. Tourmaline needles are seen penetrating quart grains.

A little gold occurs as ragged patches, stringers, an wires just outside the tourmaline bearing veins, roughly parallel arrangement of gold and tourmalin bands being seen at one point.

No. 3.—Centre.

See Fig. XI.

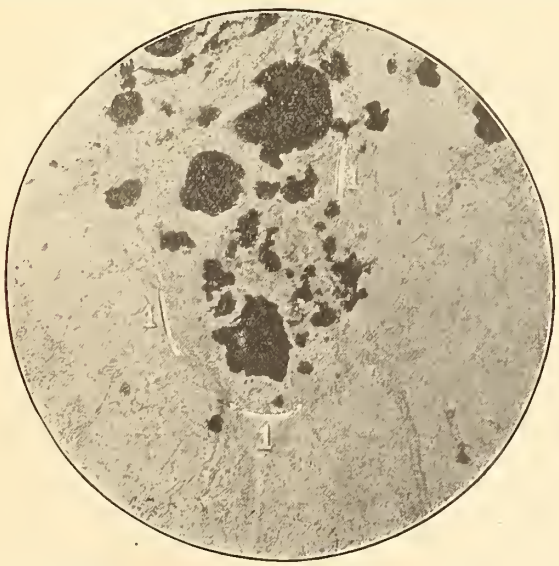
A white quartz with green bunches and streaks ric in pyrites and with free gold showing at the edges c the green patches, or just outside and closely associate with the streaks.

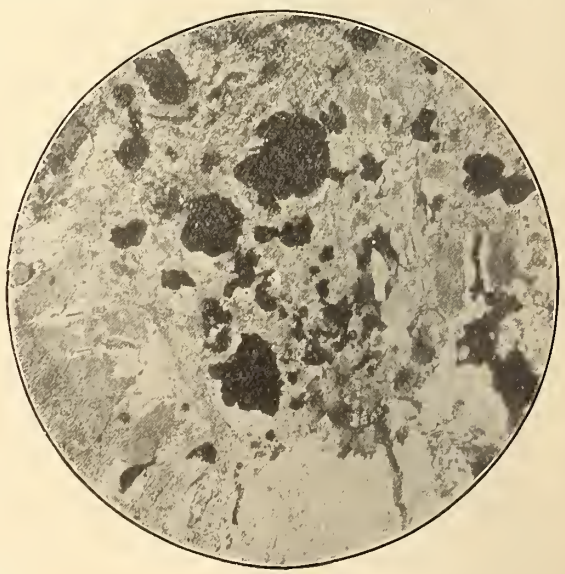
The rock is composed of quartz and a large amou of silicate, and some carbonate. The quartz is of bot coarse and fine grain, the former showing strain sh dows, and liquid inclusions containing gas bubbles a found in both. The sericite is developed in bands whic are very rich in pyrites. Tourmaline is found alon with the sericite, but only in small amount. It has th usual development in small needles. Chlorite occurs i the sericite bands and the carbonate is found in th bands too.

The pyrites is usually in large crystals and aggr gates, sometimes in small crystals. It is very abundan A little free gold is seen distributed in little speck through the veins, among the pyrites, and at one poi it is seen wrapping round pyrites.

Conclusions.

The general relations of the quartz veins and carbo ate veins point to the greater age of the latter. For th most part the quartz veins cut the carbonate veins, th being excellently shown by the microscope and only i





1. Boundaries of sericite Patch or tongue. Fig. XI. Nicols.
Shows very rich development of pyrites in sericite vein cutting quartz.

rare cases there are small veinlets of carbonate cutting through several quartz grains and hence formed after the quartz. The general distribution of the carbonate through the quartz rocks is to be accounted for by solvent action of the waters which caused the deposition of the quartz giving rise to contemporaneous formation of quartz and the carbonate found with it, and in part to solvent action of percolating waters and deposition subsequent to the formation of the quartz.

The nature of the quartz, its granular form and richness in liquid and gas inclusions, point to an igneous origin, or, at any rate, to deposition from hot solutions rich in gases. Conditions requisite for the formation of quartz with these characters are such as exist in the final stages of intrusive activity. The existence of feldspar in some of the slices shows a relation of the vein matter to aplite, and the presence of tourmaline adds weight to the idea of an igneous origin of the vein matter.

The later stages of intrusion of a granitic magma are characterized by the injection of pegmatite and aplite veins, with a progressively increasing acidity. The final stage of such an increasing acidity would be quartz and the more volatile and more soluble constituents of the original magma would be concentrated in this residual quartz.

The products of these final stages are quartz veins characterized by such volatile and more soluble constituents as well as those of a low melting point, which are immiscible with the general magma. Such constituents are gases, water, boron-rich and fluorine-rich minerals, tinstone, pyrites, gold, and so on.

Of these, gases, water, tourmaline, pyrites, and gold are widely distributed in these rocks from the Porcupine district, and afford evidence sufficient for the conclusion to be arrived at that these rocks are connected with an intrusion, probably of a granitic character, without having direct field evidence of the same.

The problem of the relation of the gold to the pyrites and the time of deposition of the gold does not receive very clear solution from examination of rock slices. But such evidence as is obtainable points to the fact that the pyrites and gold were roughly contemporaneous in deposition and that the gold to some extent was deposited at a slightly later time than the pyrites round which it wraps itself. Some slices show specks of gold scattered through a vein rich in pyrites, of which the appearance is that of being formed wholly at one time.

Subsequent enrichment in the gossan and oxidation of pyrites leaving a quartz rock rich in gold is similar to that found in very many cases of mineral veins.

The character of the quartz indicates considerable movement in the district, or at any rate earth-pressure of some magnitude, giving rise to "strain-shadows" in the large grains of quartz and to fine granulation of the same along junction planes between adjacent grains. Granulation may affect whole bands in some instances. The same evidence of earth-stresses is afforded by the country-rock, the chloritic schists, and by the dolomitic vein filling, by its banded and granulated structure, some large crystals showing progressive stages of granulation. Folding, also, of bands of the dolomite indicate the same origin.

That there has been considerable movement in these rocks cannot be doubted, but the condition of the quartz indicates that some part of it took place subsequent to the formation and filling of the veins.

ABSTRACT OF PRELIMINARY REPORT ON THE MINERAL RESOURCES OF THE CHIBOUGAMOU REGION.

(Continued From Last Issue.)

GENERAL PHYSICAL FEATURES:

The expression "Chibougamou Mining District," or preferably "Region," was applied as a term of convenient reference soon after the more recent discoveries of mineral in 1903 to designate that particular tract of country immediately surrounding Lake Chibougamou. The term "region" is the better in order to avoid the confusion with other areas in Northern Quebec, to which the term "district" has been applied, and which have thus been set apart officially to denote some of the larger land subdivisions of the province.

Strictly speaking, it is confined to the area shown on the map, which accompanies this preliminary report. It thus reaches from the Bay of Islands, the eastern extension of Lake Chibougamou, to Assinitchibastat on the West; while a line drawn from east to west about a mile north of McKenzie Bay, would mark the northern limit and a similar line cutting through Long Point (the termination of Devlin Peninsula), would constitute the southern boundary. Such an area would embrace 253 square miles.

As the region under description is situated immediately north of the height of land near the summit of the Hudson Bay slope, it has a certain general flatness of topography which is characteristic of most of our hinterland similarly situated. The general character of the country may, perhaps, be best described as that of an uneven or undulating rocky tableland with a gentle slope toward the west and northwest. The average general elevation varies from 1,100 to 1,500 feet above the sea. Few of the rounded rocky hills have more of an elevation than about 50 feet, while the complementary valleys are occupied by swamps and lakes and rivers. Low swampy shore lines are very extensive and characteristic.

Perhaps the most striking features in the landscape are the hills (or mountains) which characterize a strip of very rugged country varying in width from 5 to 6 miles and which extends across the whole of the region covered by the present map from north of Island Bay to Assinitchibastat Lake. In this direction the hills become more isolated, especially to the west of Assinitchibastat Lake, although they seem to extend as far as Opemiska and Mikwasach Lakes.

These hills have a general elevation varying from 300 to 600 feet. The highest is Cumming Mountain to the west of McKenzie Bay, which rises to a height of 625 feet above Chibougamou Lake. Juggler Mountain has

a height of 560 feet, while Sorcerer Mountain rises 575 feet above Chibougamou Lake.

In agreement with the lower ridges they have a general trend from east-northeast to west-southwest and are usually sharply conical in outline.

Near the outlet of Wakonichi Lake the Lower Huronian conglomerate forms a series of steeply scarped hills, which generally, with flat tops, rise from 300 to 625 feet above the lake, the last mentioned elevation being that of the highest, Wako Mountain. To the southwest, in the granite area, other hills were noticed, but they are somewhat lower and more regular, being for the most part separated from one another by wider stretches of level country. Bouleau Mountain, 485 feet on the west side of the lake, is the highest.

Drainage:

The greater part of the region under description is drained by the Chibougamou River and its tributaries, which, flowing in a general westerly direction, empties into the Waswanipi branch of the Nottaway River at its junction with the Obatogamau River, finally reaching Rupert Bay, the southeastern extremity of James Bay. The Chibougamou forms the outlet of Chibougamou, Dore, David, Cache, Bourbeau, Assinitchibastat and Gwillim Lakes. The waters of the northeastern part of the sheet drain into Wakonichi Lake, which also finds its way into Rupert Bay by way of Mistassini Lake and the Rupert River, the mouths of the Nottaway and Rupert Rivers being within a few miles of one another. With the exception of the Chibougamou River towards the northwestern corner of the map, none of the streams are large, but they are almost without exception easily navigable for canoes practically to their sources. They all form portions of canoe routes, which without any great length of portages reach almost any part of the district.

Lakes:

In common with other regions characterized by the presence of Archæan rocks, the region is remarkable for the number of lakes, both large and small, which are scattered over its surface. These are noteworthy for the intricacy of their shore lines, while some of them, as Lakes Simon and David and the central portion of Lakes Dore and Chibougamou, contain a great number of islands varying in size from mere rocks to some which are several square miles in extent and complex in form.

The following are the principal lakes with their areas:

Lake Chibougamou, 87.35 square miles.
Lake Wakonichi, 31.54 square miles.
Lake aux Dores, 16.89 square miles.
Lake Assinitchibastat, 5.32 square miles.
Lake David, 4.76 square miles.
Lake Simon, 4.60 square miles.
Lake Bourbeau, 2.73 square miles.
Lake Gwillim, 2.48 square miles.
Lake Cache, 1.41 square miles.

Soil:

As a rule there is a very scanty covering of soil, and over large areas the glaciated rocks are directly overlaid by the peat and moss. In places, however, there is a considerable covering of glacial till mixed with boulders. The till is decidedly sandy in its composition with very little clay admixture. It has very little fertility as a rule. Along the sides of the river valleys this unmodified drift has been re-arranged and is much fined and considerably more fertile, but even such areas are by no means desirable as farming lands, even if the climatic conditions were more favourable.

Climate:

The climate of the Chibougamou region cannot be very different from that of Mistassini. For many years, until his superannuation about five years ago, Mr. William Miller, the officer-in-charge, took certain meteorological observations, mainly as to the temperature, his observations being taken thrice daily, at 8 a.m., 2 p.m. and 8 p.m. He also made notes as to the days on which snow and rain fell and also at times made mention as to the amounts of cloud present in the sky in the usual comparative terms adopted, 10 denoting fully overcast, while 0 denotes clear. These observations have, no doubt, been forwarded to the meteorological office at Toronto, but Mr. Bateman made copies of some of them, which have been left by Mr. Miller, and from these the following generalized table has been prepared. Although incomplete, it will serve to give a good idea of the prevailing temperature at Mistassini, which is very little different from that prevailing at Chibougamou (about 40 miles S. S.W..).

Temperature at Hudson's Bay Co.'s Post.

Lake Mistassini, Quebec.

(By W. Miller, Officer-in-Charge till 1905).

	1901 Jan.	1889 Jan.	1901 Feb.	Feb.	Mch.	Apr.	May
Mean Temperatnre—	12.6	2.43	—12.3	2.07	20.5	32.2	44.3
Highest Temperature—	20	37	40	30	40	55	77
Lowest Temperature—	—41	—35	—33	—41	—09	—08	—25

	June 1889	July 1889	Aug. 1885	Sept.	Oct. 1900	Nov. 1900	Dec. 1900
Mean Temperature—	54.6	61.4	56.7		35.7	12.5	—02
Highest Temperature—	85	87	81		57	45	14
Lowest Temperature—	30	41	31		15	—22	—40

In comparison with these we may cite the mean temperatures of Ottawa, Montreal and Quebec for the twelve months of 1885, as shown in the following tables taken from Mr. O'Sullivan's report on exploration of country between Lake St. John and James Bay. These are given on the authority of the Government Meteorological Office, Toronto:

	Jan.	Feb.	Mch.	April	May	June
Quebec	7.8	6.6	11.8	35.9	51.9	59.8
Montreal	12.1	5.9	13.2	37.7	55.4	62.1
Ottawa	12.0	4.4	12.3	36.2	55.3	63.1

	July	Aug.	Sept.	Oct.	Nov.	Dec.
Quebec	66.5	51.6	52.9	42.3	31.0	16.2
Montreal	69.2	63.0	55.4	44.1	32.8	19.4
Ottawa	69.4	62.4	54.9	43.9	32.8	17.5

It was reported to us that the ice takes firmly on the lake near Mistassini Post about the end of the first week in November, and does not break up until the end of the first week in June.

During the month of June, while on the way to Chibougamou, we experienced frost on several nights, the last one occurring on June 29th, at the height of land between Obatogamou and Chibougamou Lakes, after which date until the night of August 14th (at Mistassini Post) no frost was noted. At this time the frost was only a light one and did not injure the potatoes, but a heavy frost during the night of August 18th must have completely frozen the tops.

The rapid changes in the season seem most remarkable. There is practically no spring and very little autumn weather as we understand it in the vicinity of Montreal. Thus, up to the end of the first week in September, the leaves of the deciduous trees were remarkably green, but at this period and in two days' time they had completely changed colour, assuming their

full autumn tints. The advent of spring is equally rapid, for usually the end of the first week in June sees the disappearance of the snow from the ground and the ice from the lakes while the trees burst into full foliage in the space of only a few days. On fine days when not fouled by smoke from forest fires, the atmosphere is remarkably clear and one is enabled to see mountains quite distinctly which are from 30 to 40 miles distant. This remarkable clearness of the atmosphere is shown in many of the photographs taken from the tops of the various mountains.

It is to be regretted that no measurements were made of the rainfall, and although it may not, perhaps, be extreme, it is very constant and hardly one whole day a week passes without either a continual drizzle or showers. Thunderstorms were not very frequent, but they occurred at intervals even during very cool weather. That the climate is usually moist during the summer months is evidenced by the rank growths of moss and Labrador tea. The temperature is dependent on the wind and a calm day was very rare during our sojourn at the lake. Steady rain usually came with southeast, south or even southwest winds. The west and northwest winds brought decidedly cool, but clear weather; north and northwest winds usually bring heavy winds and showery weather, while an east wind very often was a sign of fine weather until it turned towards the southeast, when rain almost invariably followed.

At Mistassini Post they seemed to experience great difficulty in raising a comparatively small crop of potatoes and so no other vegetable is attempted. At the time of our visit (August 14), the potatoes were in flower with a luxuriant growth above ground, but the large potatoes themselves were only from 3 to 4 inches in their longer diameter.

The average temperature for the three summer months is probably a little less than 58 degrees F., and the heavy frosts, even late in June and about the middle of August, retard the growth, so that the tops are blackened and killed before the potatoes ripen. It is, however, beginning to be recognized that climate is extremely local and is dependent on a great many factors for a long time not fully understood or appreciated. One authority has stated that it is almost as easy to regulate the climate within certain limitations in a given district as it is to control the temperature of any residence. Thus it would seem entirely reasonable that the clearing up of a much larger area in the vicinity of Mistassini post would doubtless help to ameliorate the present severe conditions. The soil appears to be sufficiently fertile, so that in an additional two or three weeks without severe frosts, the potatoes would ripen so fully as to enable them to be kept through the greater part of the winter at least.

An abundant supply of this vegetable would greatly improve the present condition of the Indians who choose to make the interior of Labrador their home, and who, without any knowledge or wish of bettering their lot, will still continue it as their place of residence.

There can, however, be no doubt that the settlement of even the comparatively fertile slopes of Mistassini for purposes of agriculture is by no means encouraging when there are such wide areas elsewhere in Northern Quebec far more suitable for such purposes.

The Native Inhabitants:

The Indians who hunt in this district belong chiefly to the Mistassini band, although occasionally some of those residing at Waswanipi to the west or some of the Montagnais from Pointe Bleue on Lake St. John pay a visit to this district for hunting purposes. The Mistassini band belong to the Nascaupee tribe, who are a branch of the Swampy Crees. They have been converted by the missionaries of the Church of England. A lay reader, a brother of the Hudson Bay Company's agent, is their spiritual adviser. There are about thirty heads of families and the whole band numbers about 160.

Animals:

There were no signs of any of the larger animals belonging of the deer tribe, although five moose were reported as having been shot two years ago to the southeast by the Hudson Bay Company's Post at Lake Mistassini. The chief fur-bearing animals are the otter, mink, marten, beaver and muskrat. The Chibougamou region seems especially suitable as a place of residence for these valuable animals and with a little care and protection they could be greatly increased in numbers. Of the larger animals the Black Bear is very abundant especially in the region surrounding Sorcerer Mountain, but signs of his presence were noticed almost anywhere while travelling through the woods.

Ducks are, as a rule, comparatively scarce throughout the region, although there are very notable exceptions to this rule as on Rush Lake where they are very abundant (especially the black duck).

The merganser or saw-bill and a species of diver are also commonly met with. The great northern diver or loon is a usual inhabitant of the lakes and very large and beautiful specimens were seen, but they are by no means as abundant as further south. Both large and small gulls were seen, two of their favourite nesting places being on rocky islets in the large western bay of Lac Dore, and among the islands in the centre of Chibougamou Lake.

The osprey or fish hawk was also very often seen making its nest not far from the water and on the top of some of the larger white spruces. Partridges were by no means abundant during the past summer.

Fisheries:

The fishing in all of the larger lakes is remarkably good and on account of the prevailing cold water even in midsummer most of the species are firm and palatable.

The most desirable food fishes are lake trout, brook trout, whitefish and pickerel, with an occasional maskinonge. Sturgeon occurs on the Obatogamau River and its tributaries, but has not been found in the lakes immediately surrounding Chibougamou. The lake trout grows to a very large size in Chibougamou and Wakonichi Lakes, being especially plentiful and of excellent quality in the latter lake. Brook trout is especially plentiful and of large size (4-6 lbs.) in Chibougamou, Wakonichi and on the Rapid River. Whitefish from 4 to 6 lbs. in weight and of good quality are found in almost all the lakes. Pike and pickerel often from 8 to 10 lbs. in weight abound in all of the lakes, but especially in Dore Lake. Suckers of two or three varieties and often of very large size are abundant in all of the waters.

Trees:

The black spruce is by far the most abundant of this sub-arctic forest and constitutes probably more than three-fourths of the forest growth. It is most abundant in the valleys and lower levels and often forms a very dense growth of small trees. Along the side of hills and even on the summits of the mountains where the boulder clay is found, the growth is considerably larger and many of the trees in this situation would cut into logs eight or ten inches in diameter and occasionally

even this size is slightly exceeded. It is stated that even trees of four inches in diameter are suitable for pulp wood, so that in this case there would be a large supply for this purpose, especially from the mouth of Nikabau northwards. The proportion of logs suitable for lumber seems to us too insignificant to receive very serious attention.

White spruce was noticed but is by no means abundant, but it is very often met with on the sides and summits of ridges where the boulder clay is present. Some of them growing near Bourbeau and Dufault Lakes varied from 16-22 inches in diameter. Such areas, however, are limited to the rough country extending from north of Island Bay to Assinitchibastat Lakes (25 miles, with a width of about 5 miles. In such favourable situations there would be in certain places probably enough for lumbering purposes if the district were not so remote.

Cedar was not observed on the Ashuapmuchuan River, nor even on the Chigobiche until within a comparatively short distance of Chigobiche Lake. In the Chibougamou region, however, it is abundant along the edges of the lakes and streams. Although sometimes of comparatively large diameter near the base it is stunted in its growth and is of little use. The biggest tree noticed (outlet of Lake Bourbeau) measured 9 feet in circumference at the base, and was only about 30 feet high. (The Indians at Mistassini used balsam for the ribs of their canoes as they cannot get suitable cedar). Aspen is abundant on the drier hillsides, especially over recently burnt areas, and some of the trees are of good size. White birch is very abundant, and probably shares with the Banksian pine the honour of second place in point of numbers. One white birch near the west end of Lake Dufault measured 6.5 feet in circumference, while another on the Baie du Grand Peuche measured 5.6 in circumference. In spite of the comparative abundance in places of these large birch trees, the Indians of Mistassini seemed to prefer canvas in the manufacture of their canoes.

Balsam poplar is a comparatively rare tree, as the soil is in general too poor and shallow to support this tree.

Banksian Pine is perhaps next to the black spruce the most abundant, it grows in both wet and dry places, but reaches its best growth in dry, sandy or gravelly flats or hillsides. The variety growing alongside of certain of the streams has often very beautiful branches extending to the ground. The Larch (tamarac) formerly was abundant alongside of certain of the swampy streams, but with few exceptions these were all killed in 1893-94 by the larch sawfly or larch worm (Nematus erichsonii). Some of the new larches now growing are from 25 to 30 feet high.

The undergrowth in the woods is chiefly Labrador Tea (Ledum latifolium) and laurel (Kalmia glauca) which, especially the former, grow, in very thick masses generally from three to five feet in thickness. On the northern side of the height of land and especially on the northern slopes the ground is covered to a considerable depth (generally from two to three feet but sometimes more) with the bog moss "Sphagnum" with here and there small patches of the true "reindeer" moss (Cladonia).

A section of this, which has in many places been exposed, from the top downwards shows:

1. A layer of the living bog moss sphagnum; (2) a layer of pale brownish dead moss with partially decayed branches and trunks of bushes and trees; (3) a layer of much deeper coloured (brown) moss with some decayed fragments of trees, which in turn shows a gradual transition downwards into; (4) a layer of well matured peat, brownish to almost black in the lowest portions of the layer. In the lowest part of this layer the vegetable structure is often quite indistinct and much of the material in the hollows and fissures shows a distinct passage to lignite.

This moss and its lower layers of decomposition form a deep and wondrously soft carpet which on account of its soft yielding nature and thickly disseminated remnants of fallen branches and trees renders travelling exceedingly difficult and tiresome.

At the same time it forms a very effectual and complete mantle, completely concealing the underlying rocks even on some of the steepest slopes and declivities. Prevalence and depth of this moss in most cases presents an almost insuperable barrier to economical prospecting, the thick, tough and tangled mass being removed only with great difficulty and labour. This moss and Labrador tea grow luxuriantly on certain portions of the lakes' shores, especially gravel points, with here and there a black spruce, the whole producing a beautiful open park-like effect which is very pleasing after the thick sombre foliage of the dense black spruce forest.

Forest Fires:

In the region covered by our examination there are only occasional areas which have been recently burnt. The largest of these was burnt in the beginning of July of the present year. It extended from the northwestern shores of Dore Lake northeastward to Wakonichi Lake, passing the east end of Bourbeau Lake and burning most of the country between Cumming Mountain and Lac Vert. In all, the trees over an area of about 25 square miles were destroyed. During 1907 when prospecting seems to have been active in this district, many areas were burnt, the largest being to the west and southwest of Assinitchibastat Lake, where at least about 20 square miles were burnt over. There is also considerable burnt area on the Chibougamau River immediately south of the town line between Blaiklock and McKenzie while still another area was noticed extending along and on both sides of the Barlow River above the Kawasachuan River.

The causes of such fires have often been mentioned but in most of these cases they appear to have been caused by the negligence of the prospectors. Some of the fires may have been started by amateur prospectors in order to facilitate prospecting, but the areas over which these fires have passed are now almost impassable. It is difficult except after a very long dry spell, which sometimes (as during last spring) occurs, to set fire to the bush, but the fire once started during such a time is soon beyond control, and the depth of the moss and undergrowth requires from a week to ten days almost continual rain to effectually quench it.

SUMMARY OF CONCLUSIONS.

1. From a geological standpoint the Chibougamou Region, in common with other Archæan areas, promises a rich reward to diligent and intelligent prospecting, but the remoteness of the district and the almost universal thick covering of moss and peat renders the search for economic minerals both difficult and undue expensive. In addition, while large areas probably of equal economic importance from a mining standpoint still remain unprospected in much more accessible portions in Northern Quebec, it would be unwise to devote further attention to detailed prospecting in the Chibougamou District.

2. Gold. The ore bodies which have gold as their chief value do not contain this metal in a free milling state in sufficient quantity to make stamp-milling feasible.

melting ores, the values and apparent tonnage do not fer much encouragement even with railway facilities.

Copper. While some of the assays of the specimens for is metal run to a good percentage, these are special or cked samples and by no means representative of the rious deposits.

Assays which represent a commercial tonnage are rely above 2 per cent., which is not at present market-le.

Nickel. Although there is a close analogy in miner-ogical composition and origin of the chalcopyrite and rrhotite occurring at Copper Point to the famous ckel and copper deposits of Sudbury, the deposits emselves as well as the nickel contents as shown by e assays are too small to render them commercially luable at least for their nickel values.

Asbestos. The asbestos noticed in the working faces the various open cuts as well as in the dumps is in-gnificant in amount and altogether insufficient for eir successful development as mines.

Iron. While some of the occurrences of magnetite are large deposits, they are usually very low in iron, less an 20 per cent., with only very minor segregations places of high grade ore. Such ores will only become commercial possibilities at some uncertain time in the future.

Sulphur. Iron pyrites occurs thickly disseminated through the green schists and schistose diabases at Paint and Sorcerer Mountains, and also in a vein with specular iron ore at Hematite Point, but no large deposit of sufficient purity to mine for sulphur was found.

Pulp. If the greatly increased use and demand for wood pulp continues so as to permit of the use of the smaller black spruce and jack pines, the area immediately surrounding Lake Chibougamou shows a very abundant supply of these trees.

Agriculture. The district is altogether unsuitable for agriculture both by reason of the general sterility of the soil, when present at all, as well as the extreme rigour of the climate.

Railway. Your Commissioners regret that after carefully weighing the evidence which has accumulated as a result of their examination and study of the district, they cannot find that the mineral deposits so far discovered are of sufficient merit to justify the spending of public money in the building of a railway as proposed from Lake St. John to Lake Chibougamou.

A GEOLOGICAL TRIP IN SCOTLAND

Written for the Canadian Mining Journal by Willet G. Miller, Provincial Geologist of Ontario.

Scotland has been a great mother of geologists. At e end of the eighteenth century Hutton (1726-1797) ith his "Theory of the Earth," and his disciple Play-ir with the "Illustrations," placed the science on e road which it has since followed. The heroic ruggle between the plutonists, as Hutton and his dinburgh school were called, and the neptunists, or ose who sided with the great Freiberg professor, Verner, was a memorable one. Among Scottish geol-gists who were connected with this controversy may be entioned James Hall (1761-1832), to whom is due e establishment of experimental research as a branch geological investigation, and Robert Jameson (1774-854), who upheld the Wernerian system. Of this eriod were John Macculloch (1773-1835), an eminent oneer worker on the pre-Cambrian and author of markable maps, and William Nicol (about 1768-1851), whom the petrographical branch of the science is uch indebted. William Maclure (1763-1840), born at yr, has been called the "Father of American Geol-gy."

Then onward through the years there always have en eminent leaders of geological thought among cotchmen, e.g., Murchison (1792-1871), the founder the Silurian system, and Hugh Miller (1802-1856), hose writings did so much to popularize geology. To is list may be added the name of the Canadian, Logan 798-1875), of Scottish ancestry and educated in Edin-rgh. Among Scottish geologists still living may be entioned the brothers Geikie, Sir Archibald and James, e former of whom by his text-books and other writ-gs, has had a greater influence on students of the ience than has any other author. Then there are ach, Horne and other investigators, who have added uch to our knowledge of the history of the earth. ost Scottish geologists have resided in Edinburgh and have doubtless received much of their inspiration from the surroundings of the city. Edinburgh is probably unsurpassed in the facilities it offers to beginners in the study of geology. "On every side of us are incentives to study. Crag and hill rise around us, each eloquent of ancient revolutions, and each a silent witness of the revolution in progress now. At our very gates tower on one side the picturesque memorials of long silent volcanoes, with their crumbling lavas and ashes. On the other lies the buried vegetation of an ancient land, with the corals and shells of a former ocean." *

A cynic might say that Scotchmen take to geology for the same reason that they do to theology. In both sciences it is difficult at times to prove that the other fellow is absolutely wrong. This gives opportunity for argument. But whatever be the explanation of the mental attitude of the people towards other sciences, the character of the country has doubtless had much to do with the popularity of geology:—

" O Caledonia! stern and wild,
Meet nurse for a poetic child!"

or, let us add, for a geologist.

The Pre-Cambrian.

While Scotland offers classic localities to students of most branches of geology, its pre-Cambrian rocks will appeal strongly to the majority of Canadian students of the science. Our country has a greater expanse of these rocks than has any other land—approximately half of it, or 1,900,000 square miles, being underlain by rocks of this age.

North-West Highlands.

Owing to the importance of a close study of the pre-Cambrian rocks in this country, it is of great value

* Sir A. Geikie, "Geological Sketches."

Culag Hotel, Lochinver. Lewisian Gneiss in foreground Mts. Canisp and Suliven in background.

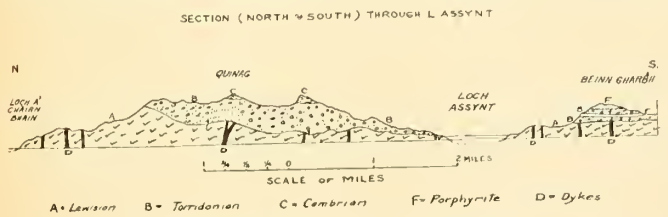
to workers here to have an opportunity of visiting areas of rocks of like age in other countries, especially where they have been studied and mapped in detail. For this reason the wrtier, while on a trip to Europe during the past summer, spent as much time as possible in the Northwestern Highlands of Scotland, a region which has been studied closely by three or four generations of geologists. It has been mapped in greater detail than has any other pre-Cambrian region in the world, and it exhibits some of the most striking illustrations of pre-Cambrian stratigraphy and structure to be found anywhere.

The success of my visit to the Highlands was due chiefly to Dr. John Horne, F.R.S., of the Geological Survey, who, while I was in Edinburgh, kindly drew up a daily programme for me so that I might see typical localities of the pre-Cambrian rocks and of their structural relations in the all too brief time I had to devote to the trip.

Itinerary.

From Edinburg I proceeded to Inverness, thence northwestward to Lairg. Here motor stage was taken to Loch Inver, on the northwest coast, where there are striking exposures of the Lewisian, reminding one forcibly of the typical Laurentian gneiss of Canada.

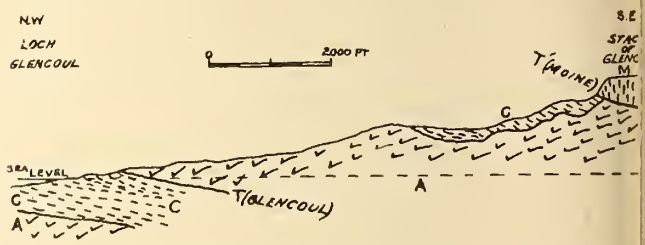
Having examined exposures of the basement rocks at Loch Inver the route was retraced eastward to Inchnadamff and Loch Assynt. Immediately north of Assynt is the mountain Quinag, extreme summit 2,653 feet. At its base is the Lewisian gneiss which is overlain by Torridon (pre-Cambrian) sandstones. The summit is capped by a small outlier of Cambrian quartzite.



(After Geological Survey of Scotland.)

On the west side the mountain is flanked by precipitous cliffs 500 to 700 feet in height. For a long distance the rocks of the three ages can be distinguished from one another by their colour.

From Inchnadamff a trip was made to Kylesku and Loch Glencoul where the famous "thrust planes" are to be seen in striking exposures. The character of the thrusts will be gathered from the following:** "The most important feature in the geology of the Nort west Highlands, which renders this region of surpa ing interest to the geologist, is the evidence relati to the terrestrial movements that took place in po Cambrian time. From a detailed examination of t structures in the field and from certain experimen researches . . . . it can be seen that under t influence of horizontal compression, or earth-creep, t rocks in that area behaved like brittle rigid bodies, a were folded over each other, snapped across, piled and driven westward in successive slices . . . . The most easterly and perhaps the most powerful these disruptions, to which the name of "Moine Thrus has been given, differs from all those to the west in tw important points. First, the materials overlying th plane comprise the Eastern Schists — the fourth the great rock groups referred to . . . . secondl in some instances the strata overlying this (thrus plane have been driven so far west—for ten miles least in the Durness area—that they rest almost direct on the undisturbed Cambrian rocks. Hence arise tho deceptive sections where there seems to be a norm sequence from the fossiliferous Cambrian zones in the Eastern Schists." The "belt of complication" e tends for 120 miles from the north coast of Sutherla to the southern promontory of the Isle of Skye. T following map of the area adjacent to Lo Glencoul illustrates the character of the thrust plan The point separating Loch Glencoul from Loch Gle dhu is composed of Lewisian gneiss, the basement roc overlain by Cambrian strata. Above the Cambrian a thrust plane, the Glencoul thrust, and overlying th thrust plane the Lewisian gneiss and Cambrian stra are repeated. Above the latter strata is another thru plane, known as the Moine thrust, and overlying th thrust plane are the Moine, or Eastern, schists. The are minor thrusts in this section to which we need n refer. The following diagram of the Glencoul secti is a slightly modified copy of one in the memoir of t Geological Survey.



Leaving Inchnadamff, I proceeded southward to Lo Maree, one of the most beautiful lakes in Scotland. order to examine especially exposures of crystalli limestones with their associated rocks and their re tion to the Lewisian. The limestones with their companying schists were found to be much like th of the Grenville series of southeastern Ontario.

From Loch Maree I travelled southward to Glene where crystalline limestone and other rocks were amined in Glen Beg.

From Glenelg a steamer was taken to Mallig, ther by railway to Fort William to see the rocks of B Nevis. This finished the programme arranged for and I returned to Edinburgh via Glasgow.

In Scotland, a Canadian is constantly struck with t difference between doing geological work there and Canada. In the Highlands, on a clear day, the vario rock groups on the treeless hills can be recogniz from a long way off, while in forest-covered Ontar

** See "The Geological Structure of the North-West Highlands of Scotland." Memoir of the Geological Survey of Great Britain, for this and following quotations concerning geology in this paper.

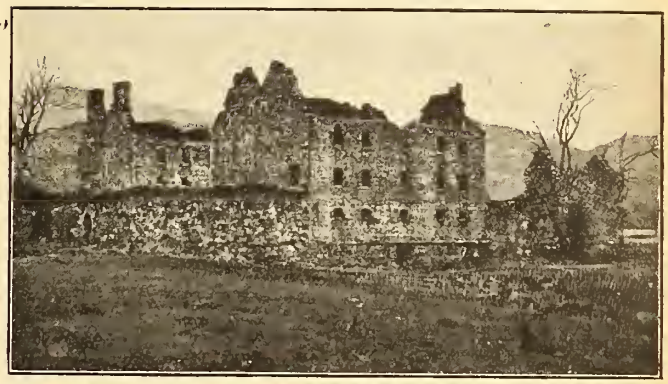
or instance, a geologist often cannot see more than a undred yards ahead, and has to search for outcrops lmost yard by yard. Again, in Scotland, even in esolate areas, one frequently has his attention dis-acted from the rocks to something of historical or ntiquarian interest. For instance, in a lonely glen ear Lochinver a circular opening in the cliffs was ointed out as having been used as a pulpit. "It was rand to hear them singing the Gaelic hymns." On he north side of Loch Assynt are two ruins, in one of vhich Montrose is said to have been betrayed. Loch Alsh, near Glenelg, was the scene of some of Prince Charlie's exploits, and at the latter place is the ruins f a barracks erected about 1715 to keep the wild High-anders in subjugation. It is fortunate, probably, that previous to the trip I had time to look up only the eological literature, otherwise I might have had my ttention still more distracted from the rocks. More-ver, to discover things for oneself added to the charm f the trip in some ways. Thus, on going to see the imestones in Glen Beg, than which "there are not nany Highland glens more attractive," I came unex-pectedly on the Pictish towers. It was almost like ex-ploring an undescribed region. "The valley is ren-dered still more interesting by these remains of Pictish towers which it contains, and which, if not perfect, are still sufficiently entire to explain the structure of these

Inchnadamff on a misty morning, showing part of Loch Assynt and Torridon Rocks in the background.

singular buildings. In an antiquarian view they are even more interesting, not only on account of their singularity, antiquity and obscurity, but because they are by much the most perfect, as well as the most accessible, specimens" of the earliest native architectural remains. Whether these Pictish towers, or burghs, are of Danish or purely native origin, has been disputed. These large circular structures are built of unhewn stone and entirely without cement. Many remains of the towers can still be traced in the Highlands. The masonry is remarkably well laid and the lines of the curvature are beautifully preserved, the form being that of a truncated cone.

Outline of the Geology.

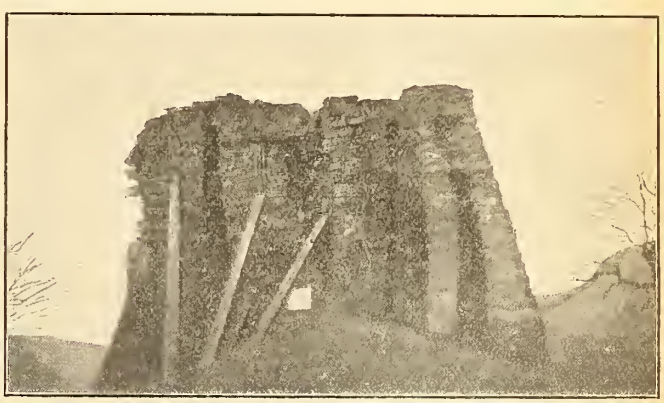
In the opening paragraph of the introduction to the great memoir on the "Geological Structure of the Northwest Highlands," Dr. John Horne so briefly and interestingly summarizes the present knowledge of the geology and the history of the work of unravelling the relationships of the rocks, that we may be permitted to quote his words: "In the North-West Highlands of Scotland four great rock-groups are remarkably developed, each characterized by a peculiar type of scenery and illustrating in a vivid manner the intimate relation that exists between geological structure and the evolution of mountain-forms. Each group has impressed its own individuality on the landscape in such a manner as to arrest the attention not merely of the geologists, but even of the casual and unscientific traveller. These four groups are in consecutive order from west to east: 1st, the Lewisian or Fundamental



Barnera Barracks, Glenelg.

Gneiss; 2nd, the Torridon sandstone; 3rd, the Cambrian formation; and, 4th, the Eastern schists. Ever since the time of Macculloch, at the beginning of the last century, the stratigraphical position and relative age of these rocks have been a subject of animated discussion and, for a time, of keen controversy. Relying on the apparent order of superposition, the earlier observers naturally inferred from the magnificent sections laid bare along the western fjords and on the grand escarpments and dip-slopes of the mountains, that the Eastern Schists follow the Cambrian strata in conformable sequence. But the geological structure which seems at first sight so simple, has proved, on later detailed examination, to be extremely complicated. The apparent succession has been found to be deceptive, and the superposition, which is undeniable, is now ascertained to be due to great terrestrial displacements, which have no parallel elsewhere in Britain."

Owing to the marked contrast in the lithological character between the three great series of rocks—the grey or pink Fundamental gneiss, the red Torridon sandstone, and the white Cambrian quartzites with the limestones and dolomites—it was possible for the officers of the Geological Survey to trace the several portions of these formations even through extremely complicated structures.



Lower Picts Tower, Glenbeg, Glenelg.

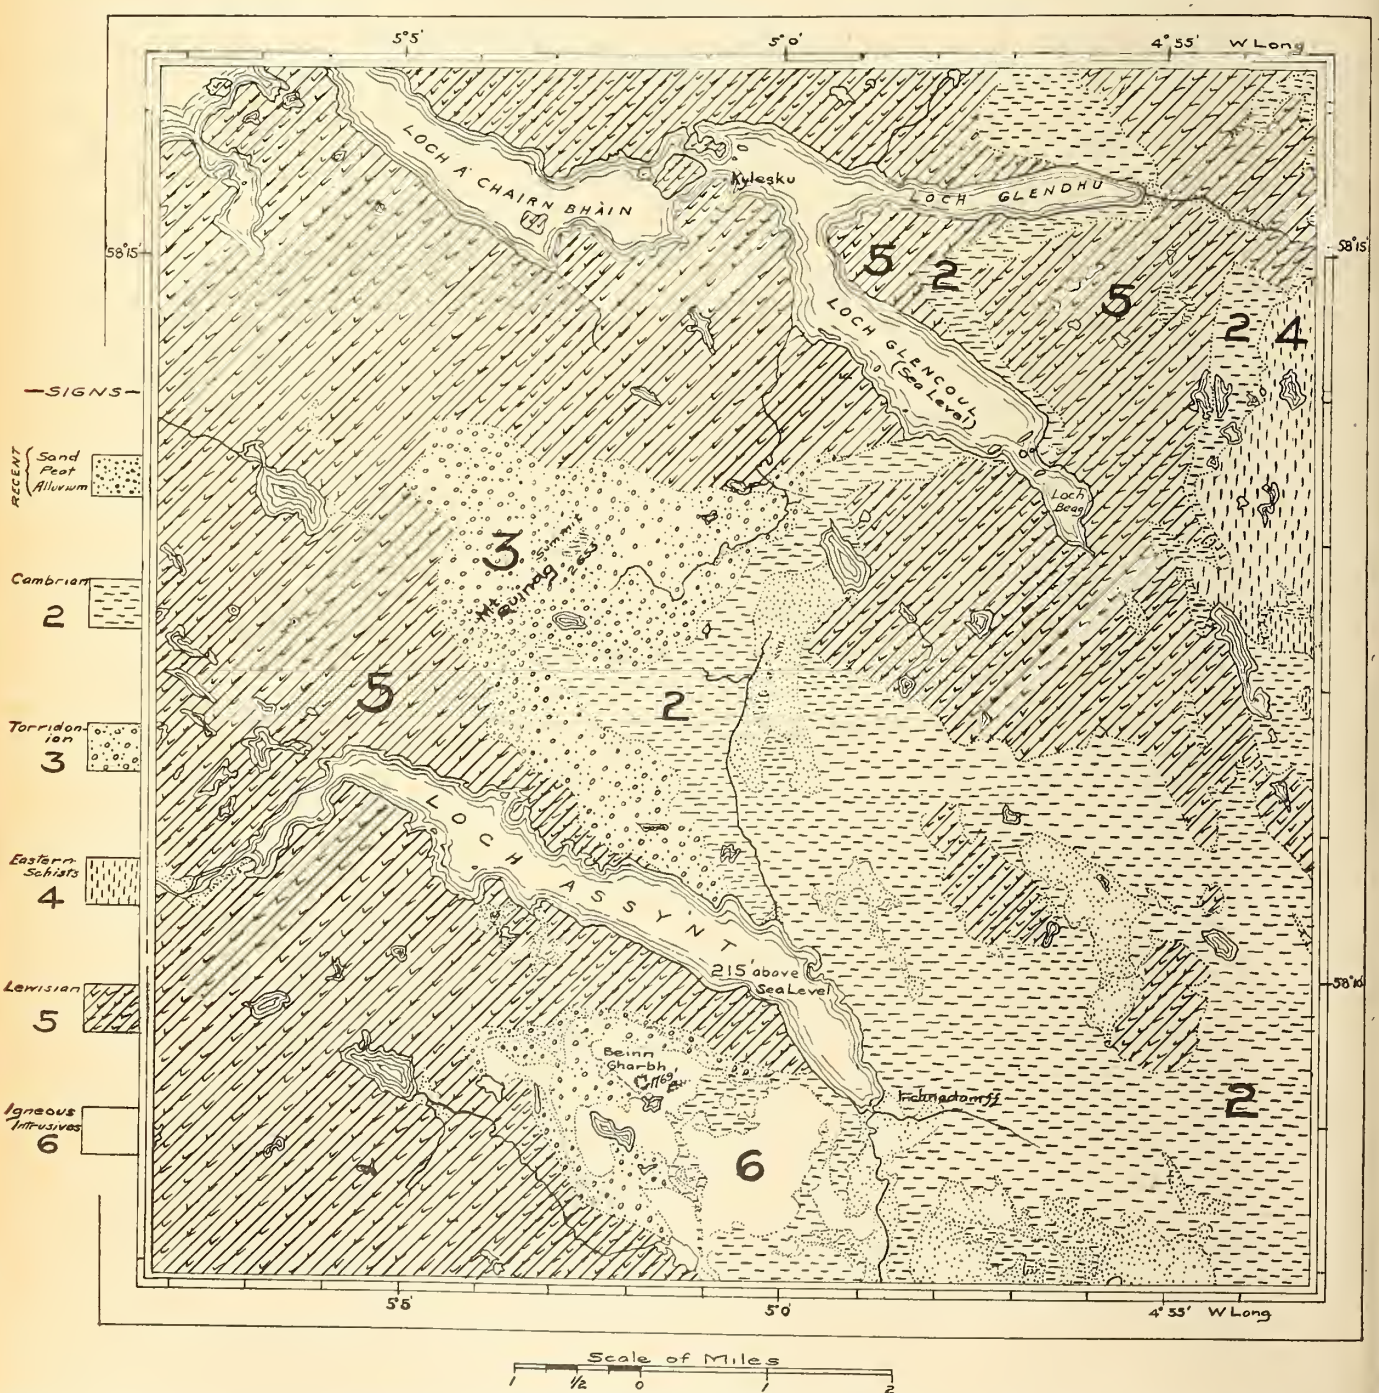
Early Work in Scotland and Canada.

Between 1814 and 1824 Macculloch proved the true relationship between the two great series, the Lewisian and the Torridonian. This relationship is like that which exists between the Huronian and the Laurentian

Culag Hotel, Lochinver, with exposures of Lewisian Gneiss.

of Canada, where work did not begin on the pre-Cambrian till nearly twenty years later. In 1827 Murchison and Sedgwick visited northwest Sutherland. From this time on, during the thirty years or so that Logan and his assistants were working out the structural and age relations of the pre-Cambrian rocks of Canada, the ancient rocks of the Northwest Highlands received much attention, notably from Murchison and J. Nicol. By 1860 the latter had worked out the relationships of the rocks so completely that he is admitted to have "displayed the qualities of a great stratigraphist in grappling with the tectonics of one of the most complicated districts of Europe."

The papers published on the Highland rocks and the controversies concerning them, during the period to which reference has been made, must have been of



Geological Map of the area in the vicinity of Lochs Assynt and Glencoul, Sutherlandshire. The map shows the area distribution of the pre-Cambrian (Lewisian and Torridonian) and the Cambrian together with the two thrust planes at Loch Glencoul. (After colored may of the Geological Survey of Scotland.)

much interest, and doubtless acted as an inspiration, to Logan and his associates engaged with similar problems.

The Lewisian.

The Lewisian or Fundamental Gneiss stretches as an interrupted belt from Cape Wrath to Loch Torridon. Like much of the territory occupied by the Laurentian of Canada, this belt of country is remarkably bare and sterile. Rounded domes and bare ridges, with intervening hollows, follow one another.

The Lewisian system occupies a position in relation to the sandstones and conglomerates of the Torridonian similar to that which the Laurentian and Keewatin do to the fragmental Huronian and Keweenawan series of Canada. In other words the Torridonian rests on the Lewisian with strong unconformability. Moreover, like the typical Laurentian, the Lewisian rocks are characterized by banded and foliated structures.

The Geological Survey of Scotland has arranged the Lewisian in two groups: (1) a Fundamental Complex, composed mainly of gneisses that have affinities with plutonic rocks, and, to a small extent, of crystalline schists and limestones which are probably of sedimentary origin; (2) a great series of igneous rocks intrusive in the Fundamental Complex in the form of dikes and sills.

Group (1) is very similar to that which was embraced under the name Laurentian by Logan, whose classification has been used up to comparatively recent times in Canada. The gneisses of Scotland correspond to the typical banded gneiss of Logan's Laurentian, while the crystalline limestones can be compared with his Grenville series, which was placed by him in the Laurentian system. During recent years in Canada the name Laurentian has been used in a more restricted sense.

Sediments in Lewisian.

In the memoir to which reference has been made, Dr. Horne says: "If the stratigraphical relation of the altered sediments of the Lewisian gneiss to the gneisses that have affinities with plutonic rocks could be definitely ascertained, it would possess much geological interest, in view of the antiquity of these sediments and the relative ages of the original types of gneiss. There is no clear evidence that these types are intrusive in the former, but, in certain places, the two are so intimately associated as to suggest that the rocks of igneous origin may have been injected into those of sedimentary origin. On the other hand, there is undoubted proof that, north of Loch Maree, the altered sediments rest on a platform of gneiss and are locally overlain by gneiss with basic dykes, the superposition of the gneiss on the sediments being there due to folding and thrusting."

The sediments, consisting of the crystalline limestones and associated rocks, are much like the sediments in the Keewatin-Laurentian complex of southeastern Ontario. Mr. Cyril W. Knight and the writer have expressed the opinion that the older crystalline limestones here represent marine precipitates which have been deposited on the surface of the Keewatin lava flows. Then the rocks having been subjected to stresses, in many localities, a complexity has been produced which is difficult to unravel. In so far as the writer could see, a similar relationship may exist between the crystalline limestones and some of the other Lewisian rocks of Scotland.

The igneous gneisses of the Fundamental Complex of Scotland represent plutonic types, while the Keewatin rocks of Canada, our oldest rocks, are volcanic. This difference may be accounted for by the fact that the period of denudation prior to the deposition of the Torridonian sediments was more prolonged than was the period of denudation in Canada prior to the deposition of the Huronian sediments, which do not seem to be represented in the Northwest Highlands. In this Scottish region the surface igneous rocks have been eroded and the underlying plutonic types have been exposed, while in Canada denudation did not go far enough to remove the surface material, now represented by the Keewatin. "It is remarkable that their (Torridon sandstones), enclosed pebbles include pieces of quartzite, which show contact alteration, spherulitic jaspers that have been formed by the silicification of liparites, and spherulitic felsites which closely resemble those of Uriconian age in Shropshire. As these fragments have all been derived from formations that are now not visible anywhere in the western part of the Counties of Sutherland and Ross, they furnish further evidence of the denudation of the Archean plateau in the pre-Torridonian time."

In other words, the quartzite pebbles show that pre-Torridonian fragmental series, probably to be correlated with the Huronian of Canada, and the liparites and felsites show that a series of volcanic rocks have been removed by denudation, bringing to the pre-Torridonian surface the plutonic types of the Fundamental gneiss. The felsites and other volcanic types may represent a series comparable in age with the Canadian Keewatin.

(to be continued.)

THE POSSIBILITIES OF CANADIAN PEAT

An Address delivered by Dr. Eugene Haanel, Director Mines Branch, Ottawa, Ont., before the Toronto Canadian Club.

On a former occasion I had the honour of addressing the members of this Club on the subject of electric smelting. I am happy to be able to state that the production of pig iron by the electric process has been solved both technically and commercially. When the projects now under way in Sweden are realized it will mean the annual production of 250,000 tons of electrically produced pig iron—nearly one-half of the whole output of Sweden at the present day.

I regard it as a special privilege to be permitted again to address you on a subject of importance to the business interests and the domestic happiness of the inhabitants of Canada.

In a country such as ours, where, in addition to the increasing amount of fuel required for industrial purposes, we are, during the long winters, dependent upon artificial heat in our homes, the item of cheap fuel and its economic use becomes one of the most important factors in the comfort and prosperity of the nation. I have, therefore, chosen as the subject of my address: "The fuel supply of the central provinces and its economic use."

I confine my remarks to the central provinces, because these provinces are almost wholly dependent upon outside sources for their fuel. The other provinces are sufficiently near the immense coal deposits of the ex-

treme east and west to render them available as sources of fuel, without increasing the price unduly by the cost of long haulage.

The fuel resources of the central provinces are represented by:

1. The wood still standing.
2. Our oil deposits.
3. The oil contained in the oil shales of New Brunswick.
4. The lignite of Manitoba.
5. Water powers—the houille blanche—or white coal of the French.
6. And lastly, the peat deposits of these provinces.

With the exception of the lignite of Manitoba and the peat deposits and, to a continually decreasing extent, the wood of our forests, the other classes of fuel named play an insignificant part as sources of fuel for domestic use and, with the exception of the utilization of our waterfalls for the production of power, imported coal is the staple fuel for these provinces.

For the year 1909 we imported coal to the amount of nearly 10,000,000 tons, valued at $26,831,859.

The current prices of coal and wood, as per "Labour Gazette," September, 1910, are:

a

	Coal.	
	Anthracite. per ton.	Bituminous. per ton.
Toronto	$ 6.75	$5.00
Montreal	6.00	5.00
Ottawa	7.50	5.50
Winnipeg	10.50	9.00
Vancouver	....	7.50

	Wood.	
	Hard. per cord.	Soft. per cord.
Toronto	$7.50—$8.00	$5.00
Montreal	8.00	6.00
Ottawa	6.50	3.50
Winnipeg	6.00	5.00
Vancouver	4.00	....

The increase in the cost of living and the price of our manufactures, consequent upon the high prices for this absolutely necessary material, might be counterbalanced by increased energy, activity, and business ability as long as we are assured of a constant supply. Conditions, however, as they exist to-day may not continue, but change, and change suddenly, and we may find ourselves deprived of fuel from the United States, without warning. For such an event we have made no provision, we have accumulated no extra store to meet such an emergency, but import only what is needed annually. A few years ago the strike in the coal mines of the United States demonstrated that such an event must be reckoned among the possibilities. I need not point out that other causes than strikes might deprive us for long periods of this outside source of fuel. It is, therefore, wise and statesmanlike to make provision for any emergency and seek within our own territory the means of supplying this all-important necessity.

Fortunately, nature has provided a substitute for coal and wood in the peat bogs scattered in abundance throughout the central provinces. It has been estimated that the known peat bogs of Manitoba, Ontario, Quebec, and New Brunswick cover in the more settled portions of these provinces an area of 12,000 square miles, with an average depth of 6 feet. This is probably but a small fraction of the actual amount of this valuable fuel asset in existence in these provinces.

One square mile of peat bog with an average depth of 6 feet will produce 774,400 tons of peat fuel, containing 25 per cent. of moisture. The 12,000 square miles will, therefore, contain 9,292,800,000 tons of peat, having a fuel value equivalent to 5,306,074,000 tons of good coal. Such an amount of peat would supply fuel to 5,306,076 families for 100 years, assuming each family to consume an amount of fuel per annum equivalent in heating value to 10 tons of the best anthracite.

To ascertain more accurately our peat resources, the Mines Branch began, three years ago, an investigation of the more important peat deposits favourably situated as regards transportation.

Since the quality of the peat contained differs greatly for different bogs, some being suitable for the manufacture of moss litter, while others contain peat sufficiently humified for the manufacture of peat fuel, instructions were given to ascertain not only the extent and depth of the peat bogs, but also the quantity and quality of the peat contained. So far, some 14 bogs have been investigated and mapped, and it is hoped that the information contained in our reports will prevent the exploitation of bogs for purposes for which the peat contained is unsuitable.

Many attempts have been made in Canada to utilize these peat resources for the manufacture of fuel, but up to within recent times unfortunately with little success, and with the waste of large capital. The reason for these failures is largely due to lack of knowledge of the nature of peat and the processes employed for the commercial manufacture of peat in the peat-using countries of Europe.

To furnish this necessary information to prospective manufacturers of peat fuel, the Department sent a member of the staff of the Mines Branch to Europe to investigate and report upon the manufacture of peat for fuel and other purposes in the peat producing countries of Europe. A few months after the appearance of this report, the Iron and Steel Institute of Sweden offered its writer the position of peat expert of the Institute, which he accepted.

Further to encourage the peat industry of Canada, it was deemed essential to furnish actual demonstration of a successful commercial process of the manufacture of fuel from peat as practised in Europe, by the erection and operation of a plant in Canada. To carry out this idea the Department purchased 300 acres of peat bog with an average depth of 8 feet, near Alfred, Ontario, and erected a peat fuel plant, such as is used in Sweden and Russia for the manufacture of air-dried machine peat. There are 1,300 such plants in operation in Russia, which in 1902 produced 4,000,000 tons of peat fuel, with a yearly increase since then of nearly 200,000 tons. Many private plants exist in Russia in connection with cotton mills, producing annually 200,000 tons of peat fuel.

The process is an exceedingly simple one. The peat is dug by hand and transferred by an elevator into a pulping mill. The pulp resulting is conveyed by cable cars to the drying field, rolled out into a sheet of some 4 inches in thickness by a field press, which also divides the sheet into longitudinal strips, which are further divided transversely by means of 3-bladed roller knives, operated by a labourer. The pulp is thus divided into blocks, which are left to dry on the field. Turning and stacking for more complete drying is done by boys. The pulp mill, cable cars and field press are operated by a steam engine. The capacity of the plant is from 25 to 30 tons per 10-hour day. During last season, operating

for 50 days, 1,500 tons of peat fuel were manufactured. The weather conditions of the season were very unfavourable, the men employed new to their work, and changes required in a new plant involved a number of stoppages. Under this severe test, the amount of fuel produced must be regarded as thoroughly satisfactory. The plant was visited by the members of the American Peat Society during their recent meeting in Ottawa in July last. Many other parties interested in peat have taken the opportunity to examine the plant and witness its operation.

In my address before the American Peat Society, which met at Ottawa last summer, I stated that, allowing 140 days for a season's operation, the cost per ton of fuel, including interest on capital invested, amortization, oil, and repairs, is as follows:

Cost of fuel on the field ..... $1.40 per ton.
Cost of fuel stored in shed ..... 1.65 per ton.

I have since then, however, come to the conclusion, that probably 110 working days will, considering our climatical conditions, be a fairer estimate of the period during which peat can be manufactured. This shorter period of production will increase the cost of manufacture to about $1.50 per ton on the field with our plant.

Some 600 tons of this peat fuel were sold in Ottawa and the vicinity of Alfred, and it has given great satisfaction. Constant application is made to the Department for additional supplies and telegrams received from outlying towns asking for carloads of it. These demands could, unfortunately, not be met, as the remaining amount of peat fuel is required for our fuel testing plant at Ottawa.

The fuel manufactured is specially adapted for grates, cooking stoves, and wood stoves. In fact, for the grate this fuel is far superior to cannel coal. Its advantages over cannel coal are:

1. It burns with a clear, luminous flame, without poking.
2. It does not eject into the room burning particles, does not, therefore, require a wire netting to protect the floor.
3. It leaves no unburnt material. The ash left is a soft flocculent powder.
4. It does not soil the hands.
5. It does not, as cannel coal, cover the back of the grate with a thick layer of soot.

Its disadvantage is its greater bulk.

The Government peat plant at Alfred serves the purpose of demonstrating the manufacture of air-dried machine peat and is suitable to be operated on bogs near villages or by groups of farmers who own peat lands and who are desirous of making their own fuel, as a cheap and excellent substitute for the high priced coal which they are now obliged to purchase. This is successfully done in Europe. The cost of the plant amounts to $7,600.00, including duty and freight on engine, peat machine, cars, and rails.

For the manufacture of peat fuel on a large scale, say 20,000 to 30,000 tons annually, mechanical excavators, spreaders, and cutters should replace the manual labour employed at our plant. On account of roots and stumps which are found in most bogs, the mechanical excavators brought on the market have not hitherto proven successful. It is only within the last two years that the problem of the construction of a successful excavator has been solved by Lieutenant Ekelund, of Sweden. By the employment of his machinery the cost per ton on an annual output of 30,000 tons is reduced to 92 cents in the shed.* This figure includes interest and amortization of the bog and machinery, transportation to shed, interest and amortization of the sheds, management, taxes, etc. Both Mr. Hystrom, the peat expert of the Iron and Steel Institute of Sweden, and Mr. Wallgren, the peat expert of the Swedish Government, who each investigated the Ekelund plant for three weeks, have verified this astonishingly low figure of the cost of production of the peat fuel as 92 cents per ton. By the adoption of the Ekelund machinery the problem of economically producing air-dried machine peat may be regarded as solved and the successful inauguration of a peat fuel industry looked forward to with confidence.

Ekelund, however, starting from air-dried machine peat, with 40 to 50 per cent. of moisture, carries his process further to obtain a product in the form of powder with 10 per cent. of moisture, the heating effect of which is stated to be equivalent, pound for pound, to the best English bituminous coal. This peat powder is admirably adapted for industrial purposes. Blown under a boiler, it burns with a long hot, smokeless flame, leaving no unburnt particles. The flame is readily regulated, extinguished and relighted at pleasure. The firing is automatic. The powder is a magnificent fuel for steam raising. As it gasifies instantly and completely, it deposits no soot on the tubes or other surfaces and avoids the smoke nuisance consequent upon firing with soft coal. There are no clinkers; the ash is a soft, friable powder, which is conveniently removed by a suction fan. Professor Odelstierna reports that the powder is not liable to spontaneous combustion, is admirably adapted to metallurgical operations, the flame being easily changed from an oxidizing to a reducing flame and vice versa. The combustion of the powder produces the highest temperature which the structural material of our furnaces can stand. Furnaces using peat powder are more cheaply constructed than furnaces using soft coal or generator gas.

This fuel is specially adapted to the cement, glass, and clay industries.

The Ekelund process has, moreover, the advantage of being independent of weather conditions, since the partially air-dried peat harvested during the summer months may be worked up into peat powder during the winter months.

The cost of manufacture of one ton of peat powder made from air-dried peat, including power, wages, interest, amortization, management, taxes, insurance, wear of bags, etc., is in Sweden $2.30 per ton.

Cost of plant, including the necessary machinery, furnaces, buildings, all complete for the manufacture of 20,000 tons annually, is $86,000.

The interesting statement has come to hand, that as a result of instructions received by the Railroad Commission of Sweden from the King, to investigate the feasibility of using peat fuel in locomotives, the Commission recently recommended the construction of freight engines using peat fuel. Designs for two engines have been submitted by the Commission; one larger, requiring two firemen, to have the same traction power as the regular type E of the Government railways, the other smaller, requiring but one fireman.

Whatever fuel, however, we use, be it imported coal or peat fuel, it is in the interests both of economy and the conservation of our fuel resources, that for manufacturing purposes we employ methods which will convert the largest number of heat units stored in the fuel

*The cost of common labour in Sweden is from $1.08 to $1.22 per day of 10 hours.

into useful work, or, to state this in another way, convert the heat energy of the fuel into useful work with the least possible loss.

The general practice pursued in our manufactories of converting the energy stored up in the fuel used into useful work, by burning it under a boiler and utilizing the expansive power of the resulting steam in a steam engine, is a wasteful and inefficient method.

Using a coal of 12,500 B.T.U. per pound, at $4 per ton, an ordinary 250 h.p. steam plant requires a minimum of 5 pounds per B.H.P.H. This amounts to 15 tons, costing $60 per h.p. year of 6,000 hours.

Contrast this with a h.p. year developed in a modern gas producer power plant, which consumes only 1½ pounds of coal per B.H.P.H., that is, 4½ tons for a h.p. year of 6,000 hours, costing $18. For peat containing 25 per cent. of moisture and 6,750 B.T.U. per pound, burnt in a producer, 2½ pounds are required for a B.H.P.H., assuming the power station to be erected on the bog and cost of manufacturing peat $1 by the Ekelund process, (Ekelund's figure is 92 cents), the figures are as follows: for a h.p. year of 6,000 hours, 7½ tons are required, costing $7.50.

Compare these figures:

Cost of coal for steam plant for one h.p. year of 6,000 hours	$60.00
Cost of coal for gas producer power plants	18.00
Cost of peat, 25 per cent. moisture, for peat gas-producer power plant	7.50

These figures relate to plants of small capacity.

For larger plants, both steam and producer gas plants, the relative consumption of fuel will be proportionately less.

The great economy effected by a gas power plant over that of a steam plant will be manifest when it is stated that the most perfect and skilfully operated steam plant probably in existence to-day, namely, the power plant of the Interborough Rapid Transit Company of New York City, requires 2 pounds of coal per B.H.P.H., while an ordinary producer plant requires only 1¼ pounds. The saving effected by a producer plant in cost of fuel, over that of the most perfect steam plant, calculating coal at $4 per ton, is $6 per h.p. year of 6,000 hours.

Suppose that 5,000,000 tons of the coal imported into Canada are employed for the production of power by ordinary steam plants, it is evident from our figures that for the production of the same power in a gas producer power plant only 1,500,000 tons need to be imported. This not alone cuts down our coal bill for power to less than one-third of what we are now spending and sending in cash out of the country, but we are saving also to some extent labour charges in handling at the plants two-thirds of the coal now used in steam power plants.

The economical results to be achieved by the introduction of peat gas power plants are so promising that the Mines Branch installed last year at our fuel testing station at Ottawa, for purposes of investigation and demonstration, a Korting peat gas-power plant, consisting of a producer, gas engine, and dynamo, each of 60 h.p. capacity. Several tests have already been made, and the plant is now regularly used for running the machinery of our concentrating laboratory, requiring about 40 h.p. The amount of peat fuel consumption is about 2½ pounds of peat with 30 per cent. of moisture for one B.H.P.H.

At present we are installing a 100 h.p. producer for lignite and soft coal, which we confidently expect can be operated successfully with peat. When this peat gas producer investigation is complete and we are assured that the operation of these producers is uniform and will present no difficulty in practice, we will be prepared to recommend their installation at suitable peat bogs for the production of power, either for industrial purposes at the bog, or for conversion of the power into electricity to be transmitted to neighbouring towns and villages for power and lighting purposes, exactly as in the case of water power.

If this is to be achieved, the present method of working peat bogs for only 10-hour days of the short season of 110 working days must be abandoned in favour of 20-hour days. With peat gas power plants erected on suitable bogs, suitable as regards extent and depth of the bog and quality of the peat contained, the electricity generated at the power station may then be employed for operating the machinery and the transport of the manufactured peat to sheds, while electric lights will illuminate the field for the night shifts.

When this plan, which has been realized in Sweden, has also been put into practical operation in Canada, we will then have rendered ourselves independent to a large extent of outside sources for our fuel; we will have gained another cheap source of electrical energy, where water-power is not available but peat is in abundance, and we will then be prepared, at least to some extent, for any emergency that may threaten a fuel famine.

Proposed Reduction Plant of the Dome Mines Syndicate, Porcupine, Ontario.

(Written for the Canadian Mining Journal by a Special Contributor.)

So much has been written concerning the formation and ore deposits of the Porcupine district that a few points regarding the milling properties of the ore, so far as we know them, may be of interest. A discussion of the probable metallurgy in detail would be somewhat premature, so an attempt will be made to bring out only some of the more important results of experiment and give a general outline of the plant which is being installed on the Dome.

During the spring of 1910, a small mill was erected consisting of 1,500-pound Nissen stamp, a 4 ft. by 8 ft. amalgamating plate, and a Deister concentrating table. Weighed quantities of average ore were milled and the work supplemented by laboratory tests to determine a process suitable to the ore.

The ore, which is essentially quartz and greenstone schist, carrying free gold and iron pyrite, was at first considered to be an ideal concentrating ore. The gold was closely associated with the iron pyrite and a high-grade concentrate could be obtained. The tailings, however, were sufficiently valuable to warrant cyaniding. By regrinding the concentrate, it was found that a large percentage of the gold could be recovered by amalgamation. The idea of concentration was then abandoned and experimental work was confined to sliming the whole product by two stage crushing, amalgamating after each and cyaniding the tailings. By grinding to 90 per cent. through a 200-mesh screen, 84 per cent. of the gold was recovered by amalgamation. The ore was particularly free from cyanicides, the only difficulty arising from the presence of a small amount of carbonaceous material which caused a secondary pre-

cipitation. This was overcome by lengthening the period of agitation.

By the middle of August, 1910, sufficient ore had been developed to justify the building of a mill. The stamp mill and cyanide practice of the Western United States was investigated and typical mills were visited. A shipment of ore was made to the Merrill Metallurgical Company, of San Francisco, Cal., as the Merrill system had been decided upon for the secondary treatment. Mill runs were made at their experimental plant and the milling properties of the ore thoroughly tested. The results were so encouraging and the ore so amenable to the treatment that it was decided to take advantage of the winter roads and ship the plant in during the present winter. The Merrill Metallurgical Company was retained to design it.

The mill, which is to be electrically driven, will be built in units of ten stamps each, four units being installed at once. A gravity plant will be obtained by making four drops from crusher to tailings discharge.

Preliminary crushing will be done in two stages, using No. 7½ and No. 5 Kennedy gyratory crushers. Belt conveyors will carry the ore to the stamp feed bins. Chalmers & Williams 1,250-pound gravity stamps will be used with straight back rapid discharge type mortars, screen 18-mesh or coarser. The foundations will be reinforced concrete. Outside amalgamation will be adopted. Superimposed Dorr drag classifiers will be installed over tube mills of the El Oro type, which will be followed by a second set of amalgamating plates. Hydraulic cone classifiers will discharge back to tube mills and overflow to Dorr thickeners. Agitation will be accomplished in a series of continuous Pachucas. Combined thickeners and press tanks will feed to Merrill slime presses which will discharge through automatic tailing samplers.

The gold will be precipitated by the Merrill zinc-dust process. The zinc-dust will be fed to a short conveyor belt, operated by means of floats and counter-weights, at a rate proportional to the volume of solution pumped from the tank. The zinc-dust will be discharged into a mixing cone and the emulsion agitated by a jet of air. A small stream of barren solution will provide a constant overflow which will carry the emulsion down a pipe to the suction of the pump. The solution will be pumped to triangular precipitating presses, precipitation taking place entirely during the passage of the solution through the pump, pump-column, and presses. The precipitates will be acid treated, fluxed, and smelted. A fully equipped assay office, machine shop, and storehouse will be built near the mill.

Nothing has been spared in the investigation and design, and nothing will be spared in the construction and equipment to make the plant a model in every respect.

Some Notes on the Appraisement of Gold Prospects.

(Written for the CANADIAN MINING JOURNAL by R. B. LAMB.)

It is probable that the engineer is called upon for no work requiring more mature judgment and skill than the task of passing upon an undeveloped or partly developed gold prospect. Properly to perform this he must utilize an experience covering varied conditions in many camps; he must bring a ripe technical training to bear; he requires to measure his problem as a manager; and, lastly, he must have the commercial sense developed to a high degree.

It is essential first to investigate the general geological conditions of the mineralized area, and the geology of the particular property. This should be as thoroughly investigated as snow and other obscuring elements will permit. It is not essential, nor is it possible, to make every observation required; but it is necessary to obtain as large an amount of data as circumstances permit. The more thoroughly this work is carried on, and the more completely the facts can be ascertained, the less the liability for error and misconception. A surface showing will necessarily have some stripping or some exposures made; or even a small amount of development work may have been performed. But however much or little this may be, some conclusion on the following points should be sought.

Nature of Vein.—Gangue matter, minerals of the deposit—prevailing country rock—dikes cutting the country, if any—do these dikes influence veins of the camp? Is the ore in continuous veins, lenses, flat sheets, or crushed zones of country, or disseminated through the rock? Are the deposits on contacts, or do they cut formations? What are the probable strike and dip and pitch of the ore shoot? What the physical and chemical characteristics of vein matter and wall rock? Are faults noticeable? Careful observations should be made for minerals that may interfere with treatment, or make chemical treatment difficult and costly. On a gold prospect the ore shoot is usually indefinitely indicated on the surface, but even so, it is imperative to determine accurately the average value of the outcrop or the exposure made, whether it be merely a part of the ore shoot or only a pit on the vein, or a part of the vein not even on or in the ore shoot at all.

In sampling and assaying for this purpose it must be borne in mind that sampling and assaying are methods employed to obtain an average of the ore faces exposed. The work, if done properly, is truly representative of the average value of the exposure. Frequency and system make for correct sampling. It is as glaring an error to shun visible gold as to seek barren spots. You are after an average. An engineer should not tremble at a speck of free gold, nor should barren spots depress him. Time is the essence of intelligent prospect appraisement. No value in terms of money can be placed on an unimproved gold prospect. It is, therefore, in many cases essential to have some certain privileges to permit of carefully determining the speculative risk involved.

Time may be demanded for diamond drilling, test pit work, stripping outcrops, or even for a small measure of development on the ore-body. Such work should only be directed towards determining invisible factors of a technical nature, and not with a view to placing the prospect in condition for valuation. Hence the work is to be carried on at the very minimum of expense, and very rapidly. In all gold appraisements no excuse can possibly be offered for the engineer's neglect to pan very frequently and to sample in many manners. Amalgamation assays are usually advisable, and check fire assays (not neglecting visible gold showings) are imperative for thorough work. The most careful sampling only gives an average value of the exposure. Other factors enter into the probable commercial importance of the deposit. A poor average will not necessarily damn the prospect, and a good average will not necessarily commend it. It is always to be remembered that

---

*Mining Engineer, Traders Bank Building, Toronto, Ont.

large low grade deposits may take considerable development, some times even years, to determine their commercial possibilities. Remembering always that the speculative risk of an unimproved prospect is greatest, so also are its potentialities largest. It is, therefore, the whole aim of prospect appraisement to arrive at judgments that tend to reduce the speculative risk to the lowest point, and to raise to the highest probability the value of the accident of location.

The one thing that governs this more than all others, after correct observations on the factors above indicated have been reached, is the experience of the past in other localities. Nothing can outweigh ripe experience in many camps, and the utilization of this knowledge in similar or approximately similar conditions elsewhere.

The history of the development of adjoining properties is a source of valuable information for the guidance of the observer. This is so self-evident that nothing further need be said regarding it.

After the appraiser has reached a conclusion on the expectations of the metal possibilities of the ore deposit itself, he must then bring a full knowledge of mining, milling, and metallurgical processes to bear on his problem. He must figure the ore extraction, reduction of ore, and the probable total cost of his speculation. Managerial risk must not be omitted. His commercial sense must be called into requisition for problems such as transportation, loss of time through weather, labour, and other ever-varying conditions. And all these observations and calculations must be balanced against the probable production of the prospect. The appraiser is then in a position to advise upon these points. How much money, if any, should be paid for determining whether a mine can be proved? How much money, if any, should be spent in development to prove or disprove the observable conditions? Over what time should the expenditure extend? How should this money be spent? In answering the above questions with intelligence the appraisement has been made—and well made.

No money valuation can be placed on undeveloped prospects. It is, therefore, impossible for an engineer to pass on the purchase price as an engineer. If the price of a mine is asked for a prospect, time and terms must be adjusted to develop reasonably a mine with prospective ore reserves. In this case the real work of appraisement is not complete until such a stage of development has been reached as will justify the payment of the purchase price. Development on an approved prospect necessitates frequent observations during the progress of the work. These observations will tend to annul, modify, or amplify the original inspection. In all cases the speculative chance diminishes with development, rejection or acceptance being the inexorable verdict.

Finally the appraiser should be cognizant of the fact that the goodwill, so to speak, of a mine is greatest when it is not a mine—merely a prospect. Hence the allurement.

The C. M. I. National Anthem.

[EDITOR'S NOTE.—We have decided to publish the only authorized edition of the Institute Anthem. As this has suffered much harmful change, and, in the versions current, contains grievous superfluities, we rejoice to be able to print it in its pristine purity. No less an authority than Col. A. M. Hay vouches for every word of the following verses. In fact, Col. Hay has been responsible for the much-needed textual emendations. A single glance reveals the beauty of form and colour, the directness of appeal, the restrained vigour, and, withal, the Homeric simplicity of these restored lines. For thus recovering a gem that was in a fair way to oblivion, principally through dilution, the Institute owes Colonel Hay a colossal debt of gratitude.]

DRILL, YE TARRIERS, DRILL.

Sure every morn at seven o'clock,
There are twenty tarriers on the rock;
All hard at work on the right of way
On Section B of the big railway.
Then drill, ye tarriers, drill.

CHORUS—

Drill, ye tarriers, drill,
For we work all day, without sugar in our tay
While we work beyant on the big railway
Then drill, ye tarriers, drill,
And shtrike and shtrike and turn the drill,
And drill, ye tarriers, drill.

Monologue, finishing with "Are you all ready, then
Blast. Fire. Noise.

English, Irish, Welsh, and Scotch,
French and Germans, Swedes and Dutch,
Poles, Italians, Greeks, begob;
Every country's on the job.
Then drill, ye tarriers, drill.

CHORUS—Drill, ye tarriers, drill.

Monologue, etc.

We go to work in gangs of three
Red-haired Mike and Bill and me;
There's no mistake, we're husky lads
That swing the sleds and hold the gads.
Then drill, ye tarriers, drill.

CHORUS—Drill, ye tarriers, drill.

Monologue, etc.

When the boss come along, says Bill to Mike:
Put all your power on the drill when you shtrike;
Mike winks at me, I wink at Bill,
While we gently shtrike and turn the drill.
Then drill, ye tarriers, drill.

CHORUS—Drill, ye tarriers, drill.

Monologue, etc.

But when the foreman comes in sight
We shtrike and shtrike with all our might.
You can't fool him, because he knows
The kind of shwing and shtrike that goes.
Then drill, ye tarriers, drill.

CHORUS—Drill, ye tarriers, drill.

Monologue, etc.

he cook is a fine man all around,
nd his wife is a great big fat fardown.
ne bakes good bread, and she bakes it well;
ie bakes it harder than the hobs of Hell.
Then drill, ye tarriers, drill.

HORUS—Drill, ye tarriers, drill.

Monologue, etc.

he foreman's name is Dan McCann,
nd I tell you what, he's a damned mean man.
ne day a premature blast went off,
nd a mile in the air went big Jim Gough.
Then drill, ye tarriers, drill.

HORUS—Drill, ye tarriers, drill.
Monologue, etc.

Next month when payday came around,
A dollar short in his pay he found.
What for, says Jim; came Dan's reply,
You were docked for the time you were up in the sky.
Then drill, ye tarriers, drill.

Monologue, finishing with "Are you all ready? Then
Blast. Fire. Noise.
Repeat Chorus: Drill, ye tarriers, drill, etc.

ALL OVER.

PERSONAL AND GENERAL.

Mr. Henry Timmins is in New York.

Sir Henry Pellatt recently visited Sydney, where he was accorded a warm public welcome.

Mr. George E. Drummond has returned from Europe.

Mr. John Hays Hammond has returned from Russia.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

Dominion Coal Output.—The outpit of the mines for January as 293,000 tons. The individual production of the collieries was follows:

	Tons.
No. 1.....	51,060
No. 2.....	52,190
No. 3.....	14,630
No. 4.....	32,420
No. 5.....	27,080
No. 6.....	18,960
No. 7.....	16,870
No. 8.....	12,730
No. 9.....	26,270
No. 10.....	14,730
No. 12.....	19,200
No. 14.....	5,930
No. 15.....	930
	293,000

This production for the month of January has only once been ceeded, 314,000 tons having been obtained in January, 1908. he Dominion Steel Company is accumulating a large storage bank coal at its works in Sydney, and this is rendering it possible give the mines fairly steady work throughout the slack time the winter, and will relieve the mines to a corresponding ex- nt in the summer, when shipping is active. This mutual accom- odation is one of the good results arising out of the common ntrol of the two companies.

The Dominion Coal Company has in preparation plans for the ilding of a new coal-loading pier near the present International iers at Sydney. Accommodation will be provided for very large eighters. The smaller of the present piers was built a long me ago and has grown inadequate for the increased shipments, d the modern type of coal freighting steamer. Work will be mmenced on the new pier in the spring.

A contract has also been given to the Simon-Carves Company, Manchester, England, for the erection of a Baum coal washer. he machinery will be delivered about July next, and it is pped to have the washer in operation by the end of the year. he washer will have a capacity of 120 tons per hour, and the akers have given very satisfactory guarantees of performance. one of the Cape Breton coals are organically dirty, and any impurities which may be present in the unwashed product are principally foreign admixture, and are very easily removed by the process of washing. Dominion slack after treatment in this washer should be a very nice product and command a good sale.

Mine Managers' Certificates.—It is announced that changes are to be made in the method of examinations for colliery managers' certificates of competency in Britain. A Central Examination Board is to be appointed for the whole kingdom, in place of the District Examining Boards which have had the granting of certificates hitherto. Commenting on the change the "Iron and Coal Trades Review" remarks editorially as follows:

"The existing system of examination is open to criticism upon a number of points. The Boards have conducted their examinations on more or less independent lines, and consequently there has been a lack of uniformity both in the standard of examination, and in the practical qualifications of the candidate . . . . and it is well known that candidates who have failed at one centre can, and do, pass at another."

In another paragraph of the same editorial it is intimated that "when the Coal Mines Regulation Act comes to be revised again, power will be given the secretary of state to grant certificates without examination to persons possessing such foreign or Colonial certificates as may be approved by him from time to time. The report fully recognized the importance of accepting only such certificates as are equivalent to certificates granted in the United Kingdom, both as regards the length and character of the experience, and the standard of the examination, so that there is no reason to anticipate other than satisfactory results from the changes which are now impending."

The matter of mine managers' certificates is one which greatly concerns the growing mining industry of Canada. One of the most vulnerable points is the arrangement which requires the Nova Scotian manager who moves to Alberta, British Columbia, or some other portion of the Dominion to sit again for a certificate in every province of Canada to which circumstances may call him. Surely the coal miners of the West are not so jealous of their brethren in the East as to desire to place barriers in the way, neither are the differences between coal mining in the East and coal mining in the West such as to necessitate two, or maybe three, distinct examinations. It is time that this useless hindrance were removed, and similar steps taken by the mining profession as have already been taken by other professions, such enced and competent men.

A matter which possibly the Canadian Mining Institute could consider profitably would be the institution of a Federal certificato of competency which would be so granted as to be acceptable to all the Provinces.

Another, and a broader suggestion, which grows out of the intimation in reference to Colonial certificates just quoted, is that arrangements might be made with the Imperial Government and other parts of the British realm for a certificate of competency for mine managers which would be accepted in any part of the Empire. Such a certificate would naturally be granted only under conditions which would ensure it being held by experienced and competent men only.

But to confine tho matter to Canada alone it seems absurd that the free exchange of experienced managers should be hindered by useless and actually absurd restrictions arising out of the provincial mining laws.

ONTARIO.

Cobalt.—The production of the camp for the first and second month of the year will run much lower than usual as a consequence of the accident to the Cobalt Hydraulic's plant at Ragged Chutes. Some of the smaller mines have had to shut down altogether, while the larger consumers have been running with their own compressor plants, which are not now adequate to their power needs. It is hoped that normal pressure will be resumed by the middle of this month.

At the annual meeting of the Silver Five Mining Company, it was stated that the receipts during the year amounted to $1,707.12 and that there was a balance on hand of $210.97.

On the 200-foot level of the Crown Reserve an ore shoot twice as long and almost as rich as on the 100-foot level, has been opened up. The vein is two and a half inches of 4,000 ounce ore. It is wholly in the Keewatin formation.

According to the statement sent out with the last dividend paid by La Rose Consolidated, that company is now in a better position than ever before, since its inception. The statement reads: Cash in bank, ore in transit, and at smelters, $708,470.99; ore sacked at mine ready for shipment, $303,343.40; total, $1,011,-814.39. Since October, the cash assets have been increased by over 65 per cent.

During the first six months of its existence the Campbell and Deyell sampling plant has milled and treated 3,406.86 tons of ore, the record reading green ore milled and sampled, 2,573.75; ore graded, 833.11; total, 3,406.86. As there were many adjustments to make to the plant at first, this record will be greatly exceeded now that the plant is running well.

Mr. Roy Finucane, son of Mr. T. W. Finucane, vice-president of the McKinley-Darragh-Savage, and Mr. R. W. Robbins, brother of the late manager, have been appointed as manager and superintendent, respectively, of the McKinley-Darragh-Savage.

According to a report from a Boston source, there are 10,000,000 ounces of ore blocked out in the Kerr Lake mine to-day, and favourable ground that has not yet been prospected.. There has been a change in the management of the Kerr Lake, Mr. John Seward being appointed manager temporarily in place of Mr. S. R. Heakes, whose health has broken down.

Owing to the favourable results obtained from sinking on the Hargrave vein in its own territory, the Drummond is now pushing work with better hope of finding more ore than for several years. What appeared to be the top of an ore shoot was cut at the 75-foot level and a shaft is being sunk to cut a more continuous ore body at the lowest level.

The Crown Reserve annual report was more satisfactory than was generally anticipated could be the case a few months ago. The production for the past year was 3,248,196 ounces and to date 9,048,196, while there was a comfortable cash surplus. During the year only 250,000 ounces had been taken from the 100-foot level of the Carson, the remainder being left as a reserve; and altogether the Carson produced a little more than half of the year's output. The mine will either build a mill this year or first company to get into Porcupine, has made the second pay make a contract with a customs concentrator, which is ahead proposed.

It is reported that now the Kerry Mining Company has reo ganized that it will recommence operations on the Cart Lake leas as soon as it can get air from the Cobalt Hydraulic.

The Crown Reserve has declared its intention of payin monthly dividends. Instead of 15 per cent. per quarter, it wi be 2 regular and 3 extra per month.

Before he left to take charge of the Timmins interests in Po cupine, Mr. P. A. Robbins was presented with a very handsom clock by the staff of the McKinley-Darragh-Savage, with whic company he has been over two years.

For December the Buffalo mill made a record. It milled 4,15 tons; 125,220 ounces were recovered, with an average head c 36.4 ounces per ton. For the three last months of 1910, 1,303,55 ounces of silver were recovered from 10,484 tons, with an averag assay of 36 ounces to the ton.

While Mr. Thomsen, who has the lease on the Green-Meeha has no definite ore body, yet the drift on the vein at the 100 fo level is looking promising with small flakes of native in the sma tite ore.

On what is known as No. 5 vein, the Beaver has opened up nice body on a very rich and wide lead. The vein cut at the 2(foot level has been struck again on the 250 foot, and there are no good prospects of blocking out reserves there. The Beaver now making regular shipments of high grade and seconds.

Thirty feet below the 500-foot level, the Temiskaming h opened up high grade ore in the winze on the No. 3 vein. T vein when sunk on was barren calcite; it changed to smaltite a now shows four or five inches of high grade ore. The cycle change is exactly the same as at the 300 and 400 foot levels, that apparently the problem of ore going below t 500 foot level has been solved so far as the Temiskaming is co cerned.

It is now definitely announced that arrangements have be made whereby the Black Mines will work the two Coleman pr perties again in an endeavour to find silver in the big cobalt vei

South Lorrain, Elk Lake and Gowganda.—The fire that swe Gowganda has destroyed at least half of the town, including ma of the hotels and stores. It is not likely that they will build again.

There is a determined effort on foot to convince the Ontar Government that a railroad should be built into Elk Lake a Gowganda. A deputation representing not only Gowganda a Elk Lake, but investors in the Montreal River country from over the province, will make a strong plea on February 15.

The Keeley mine has resumed work underground in Sou Lorrain, 22 men having been obtained from Cobalt to fill the pla of the 32 strikers who went out because the management decid to pay on the Cobalt scale.

Having paid off all their indebtedness, the Lucky Godfrey h now resumed operations at Elk Lake. Mr. G. C. Bateman is charge.

At the annual meeting of the Wettlaufer mines the stateme was given out that there was on hand $122,000 cash, a ore reserves of between 3,500,000 and 4,000,000 ounces.

The annual report of the Bellellen Mines shows that the co pany is in good financial standing and that work is proceedi well. The 7½ tons of high grade shipped netted the compa $11,000. Two shafts are being sunk, one on the Little Kee vein, where there is a solid vein of smaltite and niccolite, and t other at the main shaft.

It is now understood that the shareholders of the Farm Bank have a claim on the Welsh property at Gowganda, wh was sold to the company by ex-Manager W. R. Travers.

The Bartlett has shipped five tons of high grade ore, and ot properties in Gowganda are expected to send out further c signments shortly.

Porcupine and Other Gold Areas.—The Scottish Ontario, the ment of $25,000 to the Bannerman syndicate. The vein cut at he 100 foot level shows very uneven assay and Mr. McLaren is ow busy making a thorough sampling of the vein.

It is stated that the Porcupine Imperial Mining Company will ush in machinery before the break up of the winter roads.

There are 600 men now staking in what has come to be called he Cripple Creek camp in the Townships of Keefer, Carscallen, nd Denton. There is less blanketing going on, but it is almost mpossible to prospect with any results with six feet of snow on he ground. There is little free gold, but assays brought down un even and fairly high.

It is stated that the core drill on the Rea Mines at a depth of 0 feet is in $40 ore. The ore body had been stripped for 270 eet before the snow fell.

The Porcupine Gold Mines from its Vipond holding has arned out its first gold bar and it is on exhibition in Porcupine.

Mr. Ben Richards, who did such good work as underground oss at La Rose and Cobalt Lake, has been appointed to the same osition for the Hollinger mines at Porcupine.

It is announced that the big mining firm of Bewick, Moreing & Co. will invade the Porcupine field in a few days. Their fore-unners have already many claims under option for their engi-neers to examine when they arrive in the camp.

The past month has been a record one for sales of claims from $5,000 upwards. Buyers are much more eager in canvassing, and sellers are more reasonable. It is stated that never in the best days of Gowganda or Cobalt have payments been made so promptly nd unfailingly.

Augustus Heinze has bought the Foster, or rather taken an option on it, and Thompson P. Chester has taken over the Dome Extension for some New York interests. The McIntyre has also been sold, but to whom has not yet been stated.

The T. & H. B. Company has thrown up its option on the Foster-Ellis properties because not enough has been found to justify it in making a further payment. This is about the only case of an important option being thrown up recently.

In North Whitney the finds on the Smith veteran and the Hughes properties have attracted considerable attention.

Excellent progress is being made with the work of getting in machinery and generally preparing for the installation of the machinery at the Porcupine Power Company's site on the Mattagami. One generator has already arrived.

The Pearl Lake Gold Mines, controlled by the Cartwrights, of the Temiskaming Mining Company, has commenced work on the claims.

There now appears little doubt that the Porcupine Railway will be in to the lake by June. The right of way has been cut through, and as there is no rock work the cuts and fills can soon be negotiated by the steam shovel. The line has been definitely located by the Commission on the east side of the lake on a five-mile tangent. There will be a station at Golden City and another at the south end. The townsites on the west side are very disappointed.

Owing to the discoveries on the Day and Hughes properties the Bannerman vein has been definitely located for over two miles, with free gold showings at either end.

That the Porcupine field offers good prospects for the diamond drilling companies is shown by the number that are already operating. The Crown Chartered, the Tisdale, and the Rea Mines are all employing drills to prospect.

The Crown Reserve interests in Porcupine are now employing a good force of men to open up the McEnany claim near the Timmins. Mr. Joe Houston is in charge.

A Duluth syndicate, represented by Mr. A. M. Chisolm, has taken options on properties aggregating 1800 acres in the camp.

Union Abitibi, in the Opasatika region, where there is now a small sized rush, has a stamp mill already on the ground and will set it up this summer and commence operations. The Quebec Government has issued a report that there is telluride in the veins in this section.

The Foley-O'Brian is working three drills on the property now. The main vein shows 18 to 20 feet wide in the crosscut and the assay is said to be good.

Kenora.—The Eagle Lake district is getting a considerable amount of notice, three iron claims on Detour Point are being worked, as well as the claims to be known and incorporated under the name of the Nash Bay Mining Company, upon which work has already been done to the extent of several thousand dollars, and a small mill is on its way there now and will begin operating in the spring.

A contract has been let for $20,000 for diamond drilling over an area in which some very good surface indications have been found, giving hopes of a strong copper lead at some small depth.

The Scovil copper property on Alley Island, the patent for which has been granted and which on the surface gives values of from one to two per cent. native copper, is reported to be on the market now and there are rumours afloat of the absorption of this property by an American syndicate. Nothing definite, however, has as yet been announced.

The Kenora Mines, Limited, which is operating the Mikado Mine on Shoal Lake, is about to increase its capital stock to $1,000,000.

The Secretary-Treasurer's Report of the Prospectors' and Mine Owners' Association of the Kenora Mining Division, given at their third general annual meeting in January, 1911, shows a most successful year for that association. The members appreciated the advantages of belonging to this association so highly that they undertook to double the membership during 1911.

ALBERTA.

Blairmore, Alta., Feb. 1, 1911.—Two fatalities occurred during the month of January at the mine of the Davenport Coal Co. at Burmis. On Jan. 11th Tom Lhink, a driver, was killed by falling between the pit-cars and the rib while rounding a curve. On Jan. 21st Edwin Smith, a miner, was killed by a fall of rock. Smith and his partner were examining their room after a shot when a portion of the hanging wall fell and knocked Smith down the chute. He died a few minutes later.

The Canadian Coal Consolidated, Ltd., is installing a gasoline haulage motor in its mine at Frank, and will test it with a view to equipping the mine throughout with these motors if they prove satisfactory. The system of haulage heretofore used has been a main-and-tail rope in the tunnel and horses in the shaft workings. Gasoline motors have been used with considerable success in some mines in Europe, and operators in this country will watch with much interest to see if they are adapted to local conditions.

BRITISH COLUMBIA.

A number of managers of coal mines being operated in the province recently visited Victoria to make representations to the Government relative to the new Coal Mines Act, which was introduced into the Provincial Legislature late in January. Among them were Messrs. L. Stockett, Hosmer mines; and James Ashworth, Crow's Nest Pass Coal Company's mines, all in southeast Kootenay; W. H. Armstrong, managing director of the Nicola Valley Coal & Coke Company; and representatives of all the producing coal mines on Vancouver Island.

The British Columbia Copper Company is the latest of the metal mining companies operating in British Columbia to declare a dividend. This distribution of profits will be at the rate of ten per cent. per annum if it prove to be a quarterly dividend. Other companies that have lately paid dividends are the Granby Con. M. S. & P. Co., Le Roi No. 2, the Hedley Gold Mining Co., and the Hastings (B. C.) Exploration Syndicate.

The ninth general meeting of the Western Branch of the Canadian Mining Institute, called for February 16th, at Nanaimo, Vancouver Island, will deal chiefly with matters relating to coal mining. A comprehensive paper has been prepared by Mr. C. F. J.

Galloway, B.Sc., on "Coal Mining in British Columbia." This is a carefully made compilation of the main features of numerous official and other reports, and will be an acceptable addition to the available sources of information concerning the coal resources of British Columbia. Another valuable contribution to the proceedings at the meeting will be an address, illustrated by lantern slide views, by Mr. F. Napier Denison, F.R.M.S., of the Meteorological Office, Victoria, on "Earthquake Strains and Stresses in Relation to Coal Mine Explosions." Mr. Denison has for years been making enquiry and observations along lines that point to a connection between the occurrence of earthquakes and explosions in coal mines, and his conclusions are of much interest. There will also be a number of other addresses and papers on coal mining subjects, beside which there will be a demonstration, in a chamber filled with noxious fumes, of men at work wearing Draeger oxygen breathing helmets, designed for mine-rescue purposes.

Nelson.—The company known as the Kootenay Gold Mines, Limited, organized to acquire and operate the Granite-Poorman group of mineral claims is stated to have completed its arrangements for obtaining enough capital to admit of its objects being carried out. The more extensive development of the mines and the enlargement and better equipment of the stamp mill may be expected to be undertaken before long. The early resumption of ore-production at the Molly Gibson mine is looked for, the Consolidated Mining & Smelting Company having had a number of men at work for some time in preparing for this. It is about two years since the shipment of ore from this mine was suspended. The first-class ore will be shipped crude to Trail; later the concentration of the second-class ore at the mill near the mine will be undertaken.

Rossland.—Development and production is being continued at the Consolidated Mining & Smelting Company's Centre Star group on a comparatively large scale. The Le Roi No. 2 Company is also working up to full average capacity of the past two or three years, and the orebodies in its mines promise an output this year probably somewhat larger than that heretofore made. Trail. Nearly 70 tons of ore was shipped from the Niekle Plate Trail. Nearly 70 tons of ore was shipped fro mthe Nickle Plate during January. The Granby Company has commenced to ship to its smeltery at Grand Forks, ore from the Cliff-St. Elmo group, which it is exploring under option of purchase. The Mayflower and Blue Bird, both in the south belt, are reported to be looking well and to give promise of producing a fair quantity of ore this year. It is understood that there is a probability of the Spitzee being operated again ere long, but no definite information in this connection has yet been made public.

Similkameen.—The Hedley Gold Mining Company's operations are the most profitable of any gold mining company in the province. Profits are more than enough to allow of payment of a three per cent. dividend every three months, so an additional distribution of two per cent. has been authorized. The opening of coal mines in the Similkameen country about Princeton, and at Granite Creek, Tulameen, is in progress, and about half a dozen properties may be expected to later become produeers. Railway transportation facilities have been provided for part of the district, the V. V. & E. Railway being in operation, giving regular communieation with the Boundary country and thence, by the Great Northern Railway, to Spokane. A contributor to the Toronto Monetary Times lately made it appear that Princeton has railway connection (which is a fact) and suggested that extension to Hedley is required. The position is that the railway was first constructed from Osoyoos, near the International Boundary line, to Hedley, and afterwards extended thence to Princeton. A further extension now in progress is from Princeton to Otter flat, in the Tulameen district.

Coast.—While it is not practicable to do effective prospecting work in the Portland Canal district during the winter, excepting on properties where underground workings have been sufficiently advanced to admit of exploration being carried on, notwithstanding that weather conditions are unfavourable for surface work, operations are being continued on three or four of the best known properties. Some disappointment has resulted from the non-realization of expectations that concentrates would be shipped from the Portland Canal Mining Company's mill throughout the winter, but it has lately been announced that no output will be made until steel shall have been laid on the railway from Stewart up BearRiver Valley. The enlargement of the concentrating plant is, meanwhile, being proceeded with. Work is still being done on the Red Cliff copper property, and the Stewart silver gold group, respectively. On Observatory Inlet, the Granby Company has already done about 5,000 feet of diamond drill work, and reports are to the effect that this prospecting has proved encouraging, but it is unlikely any decision will be arrived at relative to the purchase of the Hidden Creek Company's mine, held under option, until next summer. During the four or five months that shall intervene, much additional exploration of the property will be carried out, so that the extent of the orebodies may be further determined and more information as to their value be obtained.

On Texada Island, the Tyee Copper Company is doing development work in the Cornell mine, the lease of which has been transferred to this company by the Northern Texada Mining Company. The Marble Bay mine is being opened at the 1250 foot level, 100 feet deeper than the last level, from which a considerable output of bornite ore, containing gold and silver as well as copper, has been made. The expected re-opening of the copper and iron mines on the property of the Puget Sound Iron Company has not yet taken place, but there is some probability of a move being made next spring.

Coal mining continues active, the producing mines of Vancouver Island are gradually increasing their output of coal. The prospects are that the tonnage for 1911 will be considerably larger than that of any other year since coal mining assumed important proportions on Vancouver Island.

GENERAL MINING NEWS.

NOVA SCOTIA.

Stellarton, February 3.—William Newcombe, a native of Halifax, was killed at Albion Mines this morning while unloading a car of pit props.

Sydney, February 6.—Sir Henry Pellatt and C. Hugh Brown are here. Sir Henry is paying his first visit to the Dominion Steel & Coal plants, in which he is financially interested. Mr. Brown has been the confidential adviser of some of the greatest financial corporations in the United States. Both are very free in their expression of opinion about the certainty of industrial development here.

ONTARIO.

Ottawa, February 1.—Mr. M. J. Butler, of the Steel Corporation, is here to urge the renewal of the bounty on rods, which expires in June.

"We have had a most successful year," said Mr. Butler. "At the present time we are turning out 800 tons of pig iron a day. Our output of steel per month is now 26,500 tons, our output of rails 13,000 tons, and our output of rods from 8,000 to 9,000 tons. The rail market at the present time is in an exceptionably healthy condition, owing to the construction of so many different lines in Canada. At the present time we have three cargoes of rails

n the way from Sydney to Prince Rupert. These cargoes are oing around 'the Horn.'

"About 3,000 men are now employed on the steel plant at ydney, and about 1,500 more are employed by the company get- ing out iron ore in Newfoundland and limestone at the various uarries in Cape Breton. The coal branch is now employing 6,000 ien, but next summer this number will be increased to 8,500."

Mr. Butler declined to be quoted on the new tariff agreement. t was stated by another Sydney man now in the city, however, hat the renewal of the eight cents a ton duty on coal means a oss to the Dominion Corporation of $120,000 a year. This argu- ient may be used by the steel and coal interests in urging a re- ewal of the bounties.

Toronto, January 30.—A consignment of 100 bars of silver alued at $30,000, passed through Toronto Saturday billed from obalt to Newark, N.J.

Elk Lake, February 2.—Following the recent enthusiastic meet- ngs here and at Gowganda, it has been arranged that a strong elegation will go to Toronto to meet the members of the On- ario Cabinet and urge the immediate necessity for a railroad to lk Lake and Gowganda.

Contingents from Montreal, Ottawa, Cobalt, Haileybury and New iskeard have signified their intention to join with the Montreal iver deputation in impressing upon Premier Whitney and his olleagues the fact that the time is opportune for the affording f better facilities to the Gowganda district, which it is felt the ealth and permanent nature of the camp warrant.

With better railway access there are many new properties which ill be at once placed on a highly paying basis.

Porcupine, February 2.—Following immediately upon the de- arture of Messrs. Heinze and Scott, came A. M. Chisholm, of uluth, Min., accompanied by a party of mining men and others, ho will be associated with him in what is said will be one of the rgest prospecting undertakings ever inaugurated in the district.

Porcupine, February 3.—Close upon the consummation of the ig deal for the Gray claims in the Ogden comes the report f another in the same township, the eight claims involved lying outheast of the Gray group and about a half-mile directly south of the Weston group, the purchase of which is still under consideration by interests who have been negotiating with the owner for their disposal.

BRITISH COLUMBIA.

Phoenix, February 4.—The Granby Company continues its search for new properties with a view to enlarging its field of activity. During the past few days they have secured options on 50 mineral claims on Copper Mountain, northeast of Chesaw, Wash., involving an ultimate purchase price of about $100,000.

E. E. Campbell, assistant engineer of the Granby Mines, and W. J. Mitchell, diamond drill expert, have spent some time at the properties considering the problem of getting in necessary machinery, sites for boilers and drill equipment in order to commence development work early in the spring. Arrangements are now being made for the transfer of the machinery to the mountain, while the heavy hauling may be done on sleighs.

Stewart.—The news of the week in mining circles is the commencement of shipping by the Portland Canal mine. From three to four hundred tons of concentrates are now being hauled down to the railway preparatory to shipment to either the Ladysmith or Tacoma smelters. Plans are now being made for the enlargement of the mill, bringing the capacity of treatment up 75 tons. This will necessitate the temporary closing of the plant pending alterations and installations of new tables. Manager Elmendorf announces that everything will be ready for the resumption of treatment when steel reaches the mill-site.

Red Cliff.—The incline raise started 1,000 feet in from the portal of the main tunnel is now up some 75 feet in an excellent grade of copper ore. A crosscut is also being driven in a westerly direction.

Stewart.—A new ore shoot has been struck in the face of the No. 4 tunnel at a point 220 feet from the winze. The winze is down 25 feet, following an 18-inch vein of solid galena and iron sulphides, assaying $50 to the ton. In the face of the East drift on the No. 3 tunnel, the high grade still maintains its persistence, showing native silver and argentite in noticeable quantities.

Development is also proceeding satisfactorily on the Main Reef, O. K., International, Ben Bolt, and Mt. Gladstone properties.

MINING NEWS OF THE WORLD.

SOUTH AFRICA.

Johannesburg.—A private cablegram from Johannesburg states hat during December the mines of the Rand alone (i.e., excluding utside mines) crushed 1,827,423 tons, the average yield per ton eing 28s. 1d., the working costs per ton 17s. 9d., the profit per on 10s. 5d., and the aggregate profit £952,574.

RHODESIA.

The value of the Rhodesian gold output for last year is announced as £2,569,200, which represents a decrease of about £54,-00 compared with 1909, but an increase of nearly £43,000 when ontrasted with the 1908 return. It is authoritatively explained hat the slight decrease is accounted for by the fact that a large umber of properties which were worked on a small scale by in- ividuals have been taken over by companies, and crushing has emporarily ceased pending development and the erection of up- -date machinery. At the same time the exceptionally large utputs made by the Globe and Phoenix mines should not be for- otten. In October and November last this mine was largely sponsible for the Rhodesian output rising to £234,920 and £240,-'0 respectively, the latter total establishing a fresh monthly ecord. Last month's drop to just under the £200,000 mark is so accounted for by the mine named, its production having allen back to a more normal level, the object of the management temporarily raising the returns having been attained.

The total output of gold from Rhodesia for the month of December is cabled as 47,367 ozs., valued at £199,500, as against 57,158 ozs., valued at £240,573, in the previous month. This is a decrease on the month of 9,791 ozs. There were 159 gold producers last month. The output of other minerals for last month was: Silver, 15,117 ozs.; lead, 57 tons; coal, 13,615 tons; chrome ore, 5,526 tons; asbestos, 25 tons.

UNITED STATES.

New York, February 3.—Conditions prevailing in the copper market are reported to be materially better and the quotation has been firmly established on the basis of 12½c. for electrolytic.

It is stated that sales Tuesday afternoon and Wednesday were in the neighbourhood of 25,000,000 to 30,000,000 lbs., the major portion of which was for European account.

New York, February 4.—Conditions governing the petroleum export market for the year 1910 have been eventful to producers and refiners here and in foreign markets the world over. The extraordinary increase in the world's production of petroleum, which stimulated keen competition by an effort to find an outlet for the enormous supply, led to sharp successive cuts in prices for illuminating oil, for export.

Los Angeles, Cal., February 4.—The most important development in the oil fields during the past month has been the sudden activity displayed by the Standard Oil Company. The great corporation is quietly buying all the light oil it can secure in the Midway, Maricopa, and other San Joaquin Valley fields, and is also closing contracts for this grade of oil at Fullerton. Some of the contracts being closed with producers by Standard people

provide for prices ranging from 45 to 65 cents per barrel at the wells, depending on the grade of the product.

Tonopah, Nev., February 4.—The regular semi-monthly clean-up of cyanide precipitates at the Tonopah Extension mill, covering the first half of January, has been completed and resulted in the production of 13 bars of bullion, weighing 1,705 pounds, and valued at $18,000.

Washington, January 30.—The public lands committee of the House concluded to-day on Representative Mondell's bill to regulate the leasing of coal lands in Alaska. Many interests, including Alaskan railroad and financial interests, have appeared before the committee in reference to the measure. Director George Otis Smith, of the Geological Survey, and Delegate Wickersham, o Alaska, were present.

MEXICO.

Mexico City.—The Transvaal Copper Company has develope an enormous body of ore upon its properties in the Cumpas dis trict, Sonora. Diamond drills were used during 1910 with goo results, the total work amounting to more than 5,000 feet. On ore body 90 feet thick and running 6 per cent. copper, was penc trated. An important thing recently accomplished was the un watering of the Verde shaft. The company holds 2,996 acres o mineral-bearing land, two ranches, which aggregate 41,000 acres a smelter site at Cumpas embracing 50 acres, upon which is locate a 150-ton blast furnace and a 20-ton reverberatory furnace.

COMPANY NOTES

LE ROI NO. 2.

For the last three years the dividends of Le Roi No. 2 have been at the same rate—namely, 6 per cent. per annum. The profits of the last two years, however, have come out at appreciably less than those of the preceding period. The total for the year ended 30th September last is just sufficient to provide the dividends distributed, and as a further £5,000 is added to the reserve, raising that fund to £20,000, the carry forward has become reduced by a corresponding amount. An exceptionally large sum—£21,000—was last year expended upon development, £19,500 being charged against revenue. In 1908-9 some £14,500 was disbursed under this head and £12,500 written off. We contrast below the results of the past three years:

	1909-10	1908-9	1907-8
Gross receipts	£105,946	£114,424	£128,765
Expenses, taxes, etc.	59,295	65,040	75,712
Net profit	8,944	49,384	54,053
Dividends, etc.	37,707	37,700	37,800
To reserve	5,000	5,000	10,000
Brought forward	36,397	29,713	24,460
Carried forward	31,404	36,397	29,713
Ore shipped (tons)	29,776	29,874	29,648
Yield—Gold (ozs)	26,447	28,353	28,453
Silver (ozs)	24,078	22,401	20,489
Copper (lbs)	970,996	956,812	910,384

The quantity of ore shipped to the smelters was last year just a shade less than for the preceding period, the gold contents being lower by some 2,000 ounces, the silver higher by 1,600 ounces, and the copper by 14,000 lbs. A larger tonnage of low grade ore was treated at the mine, producing 1,368 tons of concentrates, value $29.28 per ton, at an average cost, including smelting charges, of $18.6 per ton. These figures are stated to show an advanced improvement, while the percentage of gold recovered is greater than for any previous year. Twelve months ago an interesting question in connection with the mine was as to whether the valuable vein worked by the Consolidated Mining Company extended into the Surprise claim of Le Roi No. 2. It would appear from the manager's report that the drilling done did not result in the discovery of any new veins. So far as opened up at the 1,300 feet level, the extension of the south vein of Le Roi Company has yielded little of importance. The position of the mine is considered to be much the same as a year ago, although there are indications of the discovery of further ore bodies at no very distant date.

HARGRAVES MINING COMPANY.

The annual meeting of the Hargraves Mining Company was held on February 8th. The report showed receipts for the year from sales of bullion, etc., of $71,148.54, which, added to the cash on hand on Dec. 31, 1909, of $31,273.02, made a total of $102,- 421.56. Expenditures during the year were $58,800.73, leavin a cash balance in the bank of $43,620.83. Ore on hand and a smelters is valued at $37,612, making practical cash assets a the end of 1910 of $81,232.83. Total production during the yea was 635 tons, of a gross value of $117,400.74.

CEMENT COMPANY ANNUAL.

The annual meeting of the Canada Cement Company will b held at the Windsor Hotel, Montreal, February 21, at 3 p.m.

CROWN RESERVE.

Dividend No. 12.

Notice is given that a monthly dividend of 2 per cent. for th month of January, 1911, and a bonus in addition of 3 per cen for the same period, making a total payment of 5 per cent has been declared and will be payable on the 15th Februar 1911, to shareholders of record the 31st January, 1911. Transfe books will not be closed. Dividend cheques will be mailed on th 14th February, by the transfer agents, "The Crown Trust Com pany," and shareholders are requested to advise them of an change of address.

DOMINION STEEL CORPORATION.

A circular letter has been issued by the Dominion Steel Co poration announcing that the date for closing the accounts c the company has been changed from December 31, to March 3 the change being made in order that the accounts and reports c the Coal Company and those of the Dominion Iron & Steel Com pany may be presented to shareholders of both companies and t the shareholders of the Dominion Steel Corporation at the sam time.

The next statement of the Coal Company will accordingly cov a period of 15 months and the Steel Company's statement one c 10 months. The combined earnings of the two companies f the period after the payment of all fixed charges will, it is unde stood, show about 5 per cent. earned on the common stock, whi is represented by the stock of the consolidation. The expens incidental to the coal strike are estimated at $450,000, or equiv lent to 1⅛ per cent. on the stock, and the loss from the reductio of steel bounties is placed at $250,000.

MARITIME COAL, RAILWAY AND POWER CO.

A meeting of the directors of the Maritime Coal, Railway Power Company, Limited, was held on January 25th, at the hea office in the Ottawa Bank building, Montreal. It was resolve to build additional packets to facilitate water shipments of co from the new slope at Joggins. It was resolved to open anoth colliery at St. George in the eastern part of the company areas, for the further development of the property and increas the output. A ten years' lighting contract with the town c Amherst was approved and executed.

STATISTICS AND RETURNS

COBALT ORE SHIPMENTS.

Following are the shipments from the Cobalt camp for the week ding January 28, and those from January 1, 1911, to date:

	Jan. 28. Ore in lbs.	Since Jan. 1. Ore in lbs.
Beaver	122,910	186,410
City of Cobalt	.....	60,000
Crown Reserve	115,540	219,740
Chambers-Ferland	64,000	128,900
Hudson Bay	61,240	61,240
La Rose	68,480	344,090
Kerr Lake	120,330	421,233
McKinley-Darragh	83,160	462,660
Nipissing	451,130	1,009,010
Peterson Lake (Little Nip.)	58,430	58,430
Right-of-Way	68,020	128,880

The shipments for the week were 1,273,240 pounds, or 636 tons.
The shipments from January 1 to January 28 were 4,305,203 unds, or 2,152 tons.

Following are the shipments from the Cobalt camp for the week ding February 3, and those from January 1, 1911, to date:

	Feb. 3. Ore in lbs.	Since Jan. 1. Ore in lbs.
Beaver	.....	186,410
Buffalo	60,900	245,570
Chambers-Ferland	.....	128,900
City of Cobalt	.....	60,000
Cobalt Lake	.....	131,400
Cobalt Townsite	.....	249,740
Coniagas	215,800	504,450
Crown Reserve	.....	219,740
Hudson Bay	.....	61,240
La Rose	237,240	581,330
Kerr Lake	.....	421,223
McKinley-Darragh	50,960	513,620
Nipissing	62,200	1,071,210
O'Brien	.....	79,200
Peterson Lake (Little Nip.)	.....	58,430
Right-of-Way	64,670	193,550
Silver Cliff	.....	47,920
Temiskaming	75,465	221,285
Trethewey	42,000	139,250

The shipments for the week were 809,265 pounds, or 403 tons.
In 1910 the shipments amounted to 34,420 tons; in 1909, they ere 30,096 tons, valued at $12,456,301.

BRITISH COLUMBIA ORE SHIPMENTS.

The following are the returns of the ore production and movement for the past week ending January 21st and for the year to ate:

Boundary Shipments.		
Granby	21,881	66,434
Mother Lode	6,498	22,022
Snowshoe	1,730	5,445
Rawhide	5,742	12,903
Jack Pot	413	1,242
Number Seven	107	258
Other mines	.....	240
Total	36,371	108,544
Rossland Shipments.		
Centre Star	3,836	11,022
Le Roi No. 2	339	1,343
Le Roi No. 2 milled	300	900
Le Roi	277	719
Other mines	.....	74
Total	4,752	14,058
Slocan-Kootenay Shipments.		
Sullivan	152	1,251
St. Eugene milled	2,775	8,325
Richmond-Eureka	99	216
Ruth	33	69
Rambler-Cariboo	61	175
Hewitt	22	69
Queen milled	420	1,260
Granite-Poorman milled	250	750
Nugget milled	110	330
Wilcox milled	75	225
Emerald	42	142
Standard	59	122
Society Girl	62	96
Silver Bell	14	14
Utica	21	21
Beatrice	29	29
Other mines	.....	346
Total	4,224	13,440

The total shipments for the week, including the estimated milling, were 45,347 tons, and for the year to date, 136,042 tons.

B. C. COPPER CO.'S RECEIPTS.

Greenwood, B.C.

Utica	21	21
Beatrice	29	29
Other mines	.....	420
Total	7,127	21,835

The total receipts at the smelters for the week, including concentrates, were 41,661 tons, and for the year to date, 124,676 tons.

BRITISH COLUMBIA COPPER RECORD.

The British Columbia Copper Company wound up the calendar year 1910 with the best monthly production ever made—973,700 pounds of copper, which brought the year's total up to 9,411,290 pounds.

UNITED STATES PETROLEUM PRODUCTION.

The annual official report on the production of petroleum in the United States for 1909 has just been published and shows that the quantity obtained amounted to 182,134,274 barrels, as compared with 178,527,355 barrels in the previous year. With regard to the production of individual States, California was easily first, with Oklahoma and Illinois second and third respectively. Consumption of oil fuel by the railroads is steadily advancing and for the year reached a total of 19,939,394 barrels, against 16,889,070 barrels in 1908. Referring to the introduction of oil fuel into the United States Navy, the report states that it has been quite as rapid, and with fully as good results as had been anticipated.

TORONTO MARKETS.

Feb. 9th (Quotations from Canada Metal Co., Toronto):

Spelter, 5.60 cents per lb.
Lead, 3.65 cents per lb.
Antimony, 8 to 8½ cents per lb.
Tin, 44 cents per lb.
Copper, casting, 13.25 cents per lb.
Electrolytic, 13.25 cents per lb.
Ingot brass, 8 to 12½ cents per lb.

Feb. 9th—Pig Iron (Quotations from Drummond, McCall Co., Toronto):

Summerlee No. 1, $23.00 (f.o.b. Toronto).
Summerlee No. 2, $22.50 (f.o.b. Toronto).
Midland No. 1, $20.00 (f.o.b. Toronto).
Midland No. 2, $19.50 (f.o.b. Toronto).
Hamilton No. 1, $18.75 (f.o.b. Hamilton).
Hamilton No. 2, $18.25 (f.o.b. Hamilton).
Clarence, $20.00 (f.o.b. Toronto).
Cleveland, $20.00 (f.o.b. Toronto).

GENERAL MARKETS.

Coal, anthracite, $5.50 to $6.75.
Coal, bituminous, $3.50 to $4.50 for 1¼ inch lump.

Coke.

Feb. 7th—Connellsville Coke (f.o.b. ovens).
Furnace coke, prompt, $1.40 to $1.50 per ton.
Foundry coke, prompt, $2.00 to $2.15 per ton.
Feb. 7th—Tin (Straits), 41.00 cents.
Copper, prime lake, 12.70 cents.
Electrolytic copper, 12.40 to 12.50 cents.
Copper wire, 14.00 cents.
Lead, 4.50 cents.
Spelter, 5.65 cents.
Sheet zinc (fo.b. smelter), 7.50 cents.
Antimony, Cookson's, 8.25 cents.
Aluminium, 21.75 to 22.00 cents.
Nickel, 40.00 to 45.00 cents.
Platinum, ordinary, $38.50 per ounce.
Platinum, hard, $41.00 per ounce.
Bismuth, $2.00 to $2.10.
Quicksilver, $42.00 per 75 lb. flask.

A Safe and Satisfactory Investment

The 7 per cent. Guaranteed Income Bond issued by the NORTH AMERICAN LIFE among other attractive features guarantees (when it becomes paid-up in 15 or 20 years) an income of 7 per cent. of the face amount of the Bond, or in lieu of this it provides for a handsome cash return,

The holder of Bond No. 13209 a prominent physician of many years' standing in a Western Ontario community, after drawing $570 cash surplus, is now receiving an annual income of $140. in connection with his $2000. Bond, which in addition is participating in the Company's surplus every five years.

The holder of Bond No. 9153, who is one of the leading educationalists of the Dominion, writing from Montreal under date of December 20th, says; "I am in receipt of your Company's cheque for $8,390. in settlement of my $5000 7 per cent Bond, which matured to-day, The total amount I paid in was $5965. and now I find you are able to hand me $2425. more than I paid, in addition to carrying my risk of $5000 for the last twenty years. In my opinion this result is remarkable, and should appeal to all thinking men.

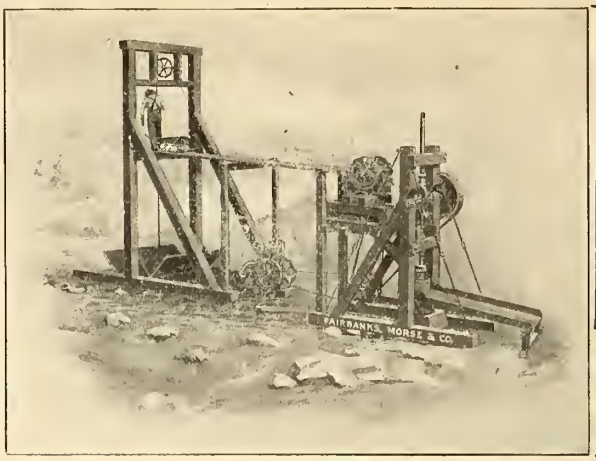
Prospector's Outfit

Fitted with NISSEN STAMP MILL



Nissen Mortar

A Boon to Prospectors

A simple, compact outfit, sturdy in construction and which is easily taken apart for transportation purposes. One man and a supply of gasoline is all that is necessary to operate the outfit.

It is fitted with a Fairbanks-Morse Gasoline Engine, which cannot be equalled for reliable continuous service. The stamp mill is a modern Nissen Stamp—the mill with largest capacity and smallest consumption of Power. Our Bulletin will tell you all about it. Send for it to-day.

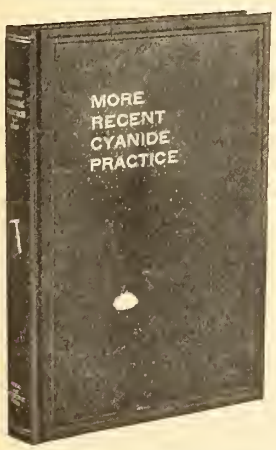
THE EXPERIENCE OF EXPERTS



More Recent Cyanide Practice

EDITED BY

H. FOSTER BAIN

424 Pages Indexed Illustrated

$2 POSTPAID

There is no information so valuable as the experience of the men who have designed, built, and operated notable mills, or the chemists and metallurgists who have solved difficult problems as they arose. This book contains articles by 82 men, among whom are the leaders in the cyanide industry. It is valuable as a handbook and together with the companion volume, 'Recent Cyanide Practice', makes an interesting compendium of the cyanide process.

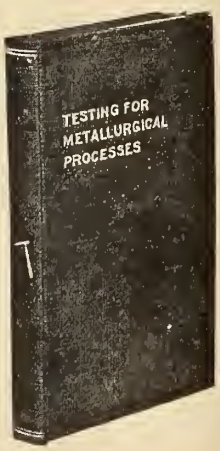
Testing for Metallurgical Processes



By JAMES A. BARR

216 pages
Illustrated
Indexed

$2 POSTPAID

This book is designed to assist in the selection of the process of treatment for any ore. The author describes the apparatus employed in making laboratory and small-lot tests. It is founded upon experimental work at the Michigan College of Mines, and the methods recommended have been tested in practice. It is brief and practical, equally valuable to the student and the practicing engineer.

Canadian Mining Journal, Toronto

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

DEPARTMENT OF MINES. GEOLOGICAL SURVEY.

PUBLICATIONS

The Geological Survey has published maps and reports dealing with a large part of Canada, with many local areas and special subjects

A single copy of a map or report that is specially desired will be sent to Canadian applicants free of cost and to others at a nominal price.

Most of the older reports are out of print, but they may usually be found in public libraries, libraries of the Canadian Mining Institute, etc.

A catalogue of publications will be sent free to any applicant. Reports that are out of print are indicated in the catalogue by a dagger.

Applications for publications should be addressed to the Director, Geological Survey, Ottawa, and should state definitely the precise area concerning which information is desired. It is often of assistance in satisfactorily filling an order for a map or report, if the applicant states the use for which it is intended. Letters and samples that are of a Departmental nature, addressed to the Director may be mailed O.H.M.S. free of postage.

THE standard treatise in English on general metallurgy. It is of the highest value and greatest practical use to every metallurgist. The sections on Alloys, Measurements of High Temperatures, Slags and Mattes are very important.

The author is President and Professor of Metallurgy, at the South Dakota School of Mines.

The Main Chapter Headings Are:

I.—The Metals and Metallurgy from the Historic Point of View. II.—Physical Mixtures and Thermal Analysis. III.—Physical Properties of Metals. IV.—Alloys. V.—The Physical Properties of Alloys. VI.—The Measurement of High Temperature. VII.—Typical Metallurgical Operations. VIII.—Slags. IX.—Matte, Bullion and Speiss. X.—Refractory Material for Furnaces. XI.—Fuels. XII.—Combustion. XIII.—The Production and Heating of Blast Furnaces. XIV.—An Example Illustrating the Physics and Chemistry of a Melting Operation. The Blast Furnace for Copper.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals, extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The silver mines of the Cobalt district have astonished the world by their richness, and promising gold discoveries have recently been made in Porcupine Lake.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are: Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows:

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unsurveyed territory, is open to prospecting.

Miners' Certificates good for a calendar year may be obtained by sending $10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minimum being 40 acres in unsurveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of $10.00 plus a yearly rental of $1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed territory may be purchased as a mining concession at the price of $20.00 per acre if within 20 miles of a railway in a straight line, or $10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

The Hon. Minister of Colonization, Mines and Fisheries
Quebec.

Province of Nova Scotia

Leases for Mines of Gold, Silver Coal, Iron, Copper, Lead, Tin

FACULTY OF APPLIED SCIENCE AND ENGINEERING

Courses in

1. Civil Engineering.
2. Mining Engineering.
3. Mechanical Engineering.
4. Architecture.
5. Analytical and Applied Chemistry
6. Chemical Engineering.
7. Electrical Engineering.

For Calendar and other information apply to the Secretary

A. T. LAING.

143 pages, 6x9, illustrated, $2.00 (8/6) net, postpaid.

A book treating in a practical way all the problems of shaft sinking under diverse conditions.

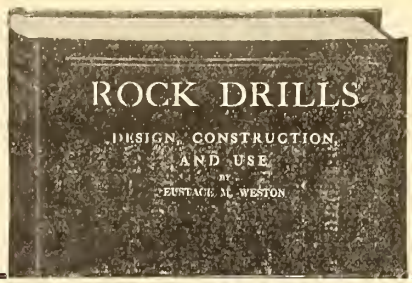
It has much material on the plant required, various methods of sinking, types and requirements of pumps, cementation, concrete linings, etc.

It is especially valuable *for its data on costs.*

Mr. Donaldson is chief engineer of the Dravo Contracting Co.

CONTENTS

Chapter I.—Some Deep Shafts—Features of Contracts for Sinking—Form of Contract. II.—Plant Required—Boilers, Hoisting Engines, Head-Frame and Bucket Air Compressors. III.—Sinking through Surface—Soft Ground—Wooden Sheeting—Steel Sheeting—Caissons of Steel, Wood or Concrete. IV.—Sinking through Soft Ground—Pneumatic Process—Shield Method. V.—Sinking in Rock—Arrangement of Holes—Tools and Methods used in Drilling—Costs and Speed. VI.—The Sinking-Drum Process—Mammoth Pump—The Freezing Process. VII.—The Kind-Chaudron Boring Process—Cementation of Water-Bearing Fissures. VIII.—Lifting Water—Horizontal vs. Vertical Pumps—Handling Pumps in Shaft—Cornish Pumps. IX.—Shaft Linings. X.—Concrete Linings—Costs per Linear Foot for Rectangular, Elliptical and Quadrilateral Shafts.



370 pages, 6x9, illustrated, $4.00 (17s) net, postpaid.

A treatise for engineers who have to select and use rock drills. It will prove a valuable handbook for all with problems in rock excavation.

Describes first the various types of rock drills in established use, their design and efficiency. It covers further the operation on the surface and underground with valuable chapters on practice in America, Australia and Africa. *It has important data on costs.*

CONTENTS

Preface. I.—Historical Sketch. II.—Standard Piston Drills. III.—Hammer Drills. IV.—Electric Drills. V.—Operating Rock Drills on the Surface and Underground. VI.—Piston Drills Designed to Use Air Expansively. VII.—Philosophy of the Process of Drilling Rock. VIII.—Repair and Maintenance of Rock Drills. IX.—Drill Steel and Drill Bits. X.—Explosives and Their Use. XI.—Theory of Blasting With High Explosives. XII.—Examples of Rock Drill Practice, Africa and Australia. XIII.—Examples of Rock Drill Practice, America. XIV.—Rock Drill Tests and Contests. XV.—Dusts and Its Prevention. XVI.—Notes on the Use of Compressed Air.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,03 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land ha been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in th Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed b Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

HON. MINISTER OF MINES

The Three Most Important Mining Books of Recent Years

They Cover

PRINCIPLES—ECONOMICS—METHODS

Principles of Mining. By H. C. Hoover, $2.50 (10/6) net postpaid.

The principles of mining as developed by modern science and business methods are here fully discussed under the general headings of Valuation, Organization and Administration. Important chapters cover investment from the public's standpoint, and the character, training and obligations of the mining engineer.

Cost of Mining By James R. Finlay. $5.00 (21s) net, postpaid.

An economic investigation of the cost of scientific, profitable mining. It contains valuable data obtained from official reports of the mines producing 75 per cent. of the metal under discussion. Detailed analyses cover cost of mining *coal, iron, lead, zinc, copper, gold and silver.*

Timbering and Mining. By W. H. Storms, $2.00 (8/6) net, postpaid.

Deals with practical methods, not theories. A straightforward account of the best, safest and most economical methods employed in the leading American mines.

CLYDE PATENT WIRE ROPE WORKS

Rutherglen, Glasgow, Scotland

WIRE ROPES

For Winding and Haulage in Collieries and Mines, Aerial Ropeways, Transmission of Power, Suspension Bridges, etc. SPECIALLY FLEXIBLE ROPES for Hoists, Winches, Loading and Discharging Cranes, Shipping Purposes, Towing, Alligator and Dredger Ropes, etc. SPECIAL ROPE FOR LOGGING.

Our Ropes are made from wire drawn for our exclusive use, and are at work all over Canada. Messrs. Nova Scotia Steel & Coal Co., Ltd., who use them largely, write that one of our haulage ropes at their Wabana Mine has been in use for **5 years**, drawing over 1,750,000 tons and still in good condition. From the Atlantic to the Pacific they are well known and our agents will be only too pleased to give all information to enquirers. They may be had from the following, viz :

Nova Scotia : Wm. Stairs, Son & Morrow, Limited. **New Brunswick : W. H. Thorne & Co., Limited.**
Montreal and Toronto : Drummond, McCall & Co. **Vancouver, B.C. : John Burns.** **Winnipeg : David Philip, Portage Ave.**

HIGHEST Quality. MODERATE Price. Prompt Delivery. SATISFACTION in use.

NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

"WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. It does not freeze, or rather, explodes with perfect efficiency when frozen and needs no thawing.

"AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appear ance, character and effect to ordinary Dynamite, except that the freezing temp erature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

PERMITTED EXPLOSIVES for Coal Mines

Nobel Monobel, Saxonite and Carbonite.

HOLMAN ROCK DRILLS

Are now making Canadian Records never before equalled for efficiency or maintenance. This is partially accounted for by the fact that HOLMAN DRILLS are practically of All Steel Construction which gives the long service record.

A recent report to hand shows a Holman Drill in constant use for four months and carrying a repair charge of only $4.20.

We positively guarantee HOLMAN ROCK DRILLS to drill at a lower cost for air and repairs than any other make of equal size.

Amatite ROOFING

Amatite is inexpensive, easy to put on, requires no care or attention or expense afterwards, and gives excellent durability.

Ordinary smooth roofing requires painting every year or two at considerable expense and trouble. Amatite, however, has a mineral surface which *requires no painting.*

Use Amatite for every roof where you want to save expense. It is the most economical solution of the whole roofing problem.

Amatite Roofing requires no skilled labor to apply; it costs no more, (in fact much less) than other roofings; and the fact that it requires no painting makes the total expense far below that of any other type of roof covering.

You can use Amatite for every kind of steep roofed building. We supply galvanized nails and liquid cement for the laps free of charge.

Send for free sample and booklet. Address our nearest office.

The Paterson Manufacturing Company, Limited, Montreal, Toronto, Winnipeg, Vancouver, St. John, N.B., Halifax, N.S.

REAL ROCK DRILL ECONOMY

Logically the true Standard of Rock Drill economy is based on the footage of holes drilled: not on a basis of time—regardless of work done.

It is obvious that the most economical drill is the one which will drill the greatest footage, per shift, the cheapest. Not the drill that runs the cheapest and does the least work.

Rand "Little Giant" Drills strike a powerful swinging blow, which has a most effective penetrating force.

The design of "Little Giant" Drills has remained practically unchanged for years, but improvements in construction have followed one another in rapid succession, always increasing the sturdiness of the drill, and keeping it to the front.

"Little Giants" insure the cheapest footage!

(England)

ANNOUNCES THE ISSUE OF THE

NEW (ELEVENTH) EDITION OF THE

Encyclopædia Britannica

In 28 Volumes and Index

For which over 15,000 have already been received in England and the United States, although the work is not yet entirely off the press.

THE NEW 11th EDITION of this celebrated work is now in the press. It has been written on the same lines of comprehensiveness and unquestioned authority which have given the Encyclopaedia Britannica a world-wide reputation since its first appearance in 1768. The new edition constitutes a **completely new survey of human learning and achievement,** necessitated by the remarkable increase of knowledge and **displacing and superseding all previous editions and unauthorized American reprints.**

(No completely new edition of this celebrated work has been published since the 9th, which was issued between 1875 and 1889.)

The Contributors—1,500 in all—represent the highest scholarship and the best practical experience of all civilized countries.

A special impression is being printed on India paper, thus greatly reducing the bulk and weight, and for greater convenience it is being bound in flexible leather. The 28 volumes and Index, although containing 27,000 pages, will occupy little more than two feet of shelf space, each volume being less than one inch thick.

Canadian Subscribers will be supplied with the ENGLISH EDITION, and not with that which, for copyright purposes, had to be printed in the U.S. The work will be delivered from England, DUTY AND CARRIAGE PAID to Toronto. The first copies are expected to arrive in Canada shortly.

A NEW ERA OF HUMAN EXPERIENCE.

The New (11th) Edition of the Encyclopaedia Britannica may be said to mark a new era of human experience. It is the only book in existence in which a scholarly and systematic attempt has been made on the lines of the broadest comprehensiveness:—

(1) To survey the whole field of knowledge at the hands of specialist authorities and practical experts;

(2) To divide it up into groups and classifications with a view to effecting a perfect co-ordination of the sub-divisions of all general subjects, and then

(3) To resolve the whole body of ascertained knowledge into its constituent parts—as the pieces of a gigantic mosaic—giving each of these an organic unity in relation to the rest, dealing with it separately on its merits, and, whenever more convenient for the reader, under its own heading and in its alphabetical place. There are more than 40,000 articles in the work, as against less than 17,000 in the Ninth Edition, and for the first time the vast extent of the world's activities and interests, the most recent results of research and experiment, are here conveniently catalogued and intelligently summarized. It will be easy to find one's way about in this storehouse of univ knowledge. All subjects appear under the most natural h ings—the things one is likely to look up are not hidden in the body of general articles, but are immediately acces

The principle of comprehensive treatment has been served throughout, but minor subjects and facts of subsi importance have received more careful attention than before.

THE NEEDS OF THE DAY.

No previous edition of the Encyclopaedia Britannica dealt with universal knowledge by so well-defined and orde system. Yet the necessity for this was never so appare it is to-day. The stress of life and the multiplied acti in which the modern world is engaged; and, above all, growth of specialization in all civilized countries—demar change in the method of presenting the sum of human k ledge—a change in the direction of comprehensiveness bined with convenience of arrangement, with greater fa of reference. The needs of the day call for the publicati a new work in which the whole field of human life and shall be presented in such a form as shall make the pursu learning rapid, agreeable, and instructive. To accomplish was the large task of the editors of the Eleventh Edition o Encyclopaedia Britannica.

THREE NEW FACTORS OF INCREASED USEFULNES

While the new (Eleventh) Edition of the Encyclopa Britannica is an exhaustive and authoritative exposition of man thought, learning, and achievement, it has acquired the new plan of editing it, three features of the widest us ness to the present generation:

(1) It is now a register and a detailed summary of world's life and progress;

(2) A complete inventory of extant knowledge reduced t A B C simplicity of arrangement;

(3) An index to all recondite not less than to all com things which can possibly interest or concern a civilized pe

EDITORIAL EXPENSES, £163,000 ($815,000).

The literary cost alone—the sum paid to contributors, tors, and editorial assistants during the past eight years— been £163,000 ($815,000), more than twice the (£60,000) similarly expended on the Ninth Edition. The expense, including the cost of maps, colored plates, illustrati typesetting and office expenses, has amounted to £23 ($1,150,000).

The Encyclopædia Britannica (11th Edition)

The Following is a partial list of authorities whose contributions have direct interest to engineers, whether civil, mechanical, mining, hydraulic, sanitary or electrical. In all other branches of industry, applied science or modern invention, the articles in the New Encyclopaedia Britannica are by writers of unquestioned standing in their profession.

Iron and Steel—H. M. Howe, LL.D., Professor of Metallurgy, Columbia University.

Hydraulics—W. C. Unwin, F.R.S., Professor Emeritus of Engineering, City and Guilds of London Institute.

Mineral Deposits—J. S. Kemp, Professor of Geology, Columbia University.

Concrete Engineering—F. E. Wentworth-Shields, M. Inst. C.E., Docks Engineer to the London & South-Western Railway.

Boilers—J. T. Milton, M. Inst. C.E., Chief Engineer Surveyor to Lloyd's Registry of Shipping.

Sewerage—J. Bartlett, Lecturer on Construction, University of London.

Aqueducts—E. P. Hill, M. Inst. C.E., partner of G. H. Hill Co., Engineers to the Corporation of Manchester.

Mining—H. S. Munroe, Ph.D., Professor of Mining, Columbia University.

Water Supply—G. F. Deacon, LL.D., Formerly Engineer in Chief for the Liverpool Water Supply (Vyrnwy scheme).

Motor Vehicles—The Hon. C. S. Rolls, Pioneer in Motor Engineering and Aviation (killed this summer in fall from areoplane at the Bournemouth meeting).

Mechanical Power Transmission—Professor W. E. Dalby, Dean of the Faculty of Engineering, University of London.

Electrical Power Transmission—Dr. Louis Bell, Electrical Engineer, General Electric Co., Boston.

Pneumatic Power Transmission—A. De Wint Foote, Superintendent of the North Star Mining Co.

Hydraulic Power Transmission—E. B. Ellington, M.Inst. C.E., Chief Engineer of the General Hydraulic Co.

Blasting—R. Peele, Professor of Mining, Columbia University.

Surveying—Sir T. M. Holdich, K.C.M.G., K.C.I.E., Formerly H.M. Commissioner for Argentina-Chile Boundary.

Tunnels—H. A. Carson, Formerly President of the Boston Society of Civil Engineers.

Electric Meters—A. J. Fleming, Pender Professor of Electric Engineering, University of London.

Dredging—Walter Hunter, M. Inst. C.E., Consulting Engineer to the Crown Agents for the British Colonies.

Irrigation—Sir C. Scott-Moncrieff, K.C.S.I., K.C.M.G., President of Indian Irrigation Committee.

Quarrying—F. J. H. Merrill, Ph.D., Late State Geologist of New York.

Traction—Louis Duncan, Ph.D., Late Associate Professor of Electricity, John Hopkins University.

Strikes and Lockouts—The Hon. Carroll D. Wright, Formerly U.S. Commissioner of Labor.

AN ENORMOUS BOOK IN HANDY FORMAT—THE ENCYCLOPAEDIA BRITANNICA ON INDIA PAPER.

The Eleventh Edition of the **Encyclopaedia Britannica** will be issued in a new format—in thin, light, and flexible volumes, which will be easy to handle and convenient to read. The volumes of the Ninth Edition were, for most persons, too cumbrous in size and too heavy to hold in the hand. But by the use of India paper (thin, but very strong and opaque), the thickness has been **reduced from 2½ inches to less than one inch**, and the complete set will occupy only about 2 feet of shelf space. (The work will also be published, for those who prefer it, on ordinary book-paper of the same quality as that used for the last edition.) In suiting the reader's convenience by reducing the size and weight of the volumes, the publishers believe they have multiplied the usefulness of the **Encyclopaedia Britannica** (Eleventh Edition) to an incalculable degree.

The List is open for ADVANCE SUBSCRIPTIONS which may be sent for the **New "Encyclopaedia Britannica" (11th Edition).** (A Fresh and Original Survey of Human Thought, Learning and Achievement to the Year 1910), **issued by the Press of the University of Cambridge (England).**

The new edition is now being printed and copies of the first English impressions are expected to arrive in Canada early in March. The work in 28 volumes and index, will be in two forms:—

(1) On INDIA PAPER (very thin and light), in Three Styles of Binding—CLOTH, FULL FLEXIBLE SHEEPSKIN, and FULL FLEXIBLE MOROCCO, the volumes to be less than one inch thick (about 960 pages). The Full Sheep and Full Morocco are especially recommended.

(2) On ordinary book paper, in Three Styles of Binding—CLOTH, HALF MOROCCO, and FULL MOROCCO, the volumes to be 2¾ inches thick (about 960 pages).

In view of the extraordinary demand for the new (11th) edition, it is apparent that all preliminary estimates of the probable size of the advance-of-publication sale will have to be disregarded. It is now confidently expected that 40,000 orders will be received by June next.

Ninety Per Cent. of the subscribers have selected the India paper edition, and the preference for the Full Sheep binding has also been made clear.

Until publication is complete, applications will be accepted at the "advance-of-publication" price. Orders will be entered as received, and filled in rotation. Owing to the steadily increasing demand for this new edition, prompt action in entering your order is more than ever important. You are not required to make any payment until the volumes are delivered.

ADVANCE SUBSCRIPTIONS (at $4.25 a volume for India paper bound in Cloth, or $4.00 a volume for the ordinary book-paper bound in Cloth) are invited from all English-speaking countries. BUT NO MONEY NEED BE PAID UNTIL AFTER DELIVERY.

At these prices (the Ninth Edition having been sold, when first issued in England and on the Continent of America at 30/- or $7.50 a volume) the new **Encyclopaedia Britannica** is a considerably cheaper book than ever before, and in its more convenient and readable form, likely to appeal to a much wider public. Furthermore, the slight additional cost for the India paper impression is not in proportion to its actual market valuation, as it is well known that books printed on India paper are always issued at high prices.

APPLICATION FOR THE PROSPECTUS.

Full particulars of prices (in advance of publication), of deferred payments, bookcases and bindings, together with a prospectus containing an account of the work, with specimen pages, order form, etc., free on application.

NOTE.—Those who possess copies of previous editions of the **Encyclopaedia Britannica** (now out of date) are requested to advise us of the fact (clearly indicating which edition they have, name of publisher, number of volumes, etc.), and if they wish to purchase the new edition will be informed how they can dispose of their old editions at a fair valuation.

GREENING'S WIRE ROPE

THE STANDARD OF QUALITY

THE best rope in the world is none too good for use in hoisting men up and down a mine shaft. Both from a humanitarian and a business stand-point, only the strongest and most reliable ropes should be used for this purpose. Greening made ropes are known throughout every mining region in Canada for their reliability. For our Swedish Charcoal ropes, we use only a specially high-class Swedish rod, drawn and thoroughly tested in our own well equipped mill. And we make also a large variety of ropes for a large variety of purposes; our best known lines being Greening's Standard Crucible Cast Steel Wire Rope; Greening's Best Plough Steel Rope; and Greening's "Acme" Steel Rope.

THE PASSING OF NICKEL.

We remember the horrid joy that was ours in reading long ago a novel writ by a talented female. The hero was a mining engineer. He was a strange compound of self-abnegation, silent sentiment, and improbable genius. He led the maiden that he loved through parlous stopes, winzes, and sumps with no regard at all for the law of gravitation. Unless our memory fails, the progress of the two was equally easy in all the workings of the mine. They walked down a ladderless winze as readily as they sauntered up an almost vertical stope. This is mining from the viewpoint of fiction.

Not less entrancing is fiction from the viewpoint of mining. And our exhibit was warm from the press but a few weeks ago. It is a short, all too short, phantasy in the American Review of Reviews, January, 1911. The artist is Dr. David T. Day, of the U. S. Geological Survey. The title is prosaic enough. It suggests nothing of the tingling inwardness of this tabloid romance. Who would or could imagine that under the caption "The Platinum and Nickel Industries" a staid geologist would have cavoorted through the iridescent realm of dreamland! But Dr. Day has thus cavoorted. Let us gambol after him for a space.

Dr. Day's word etching is elegiac; it is the funeral-song of the nickel industry. Platinum also provides a presumptive corpse, but platinum's untimely demise brings no tears to our eyes.

The first picture upon Dr. Day's small canvas is almost pastoral in effect. "For thirty years one strong personality, Joseph Wharton, a Quaker merchant of Philadelphia, ruled the nickel market in peace and prosperity. . Wharton ruled partly by being a great metallurgist, . . but chiefly by his untiring vigilance as a merchant. He ruled until foreign ores of New Caledonia and of Canada pressed their demands."

Despite Wharton's "vigorous protest," the obstreperous foreign ores knocked a hole in the tariff. United States citizens proceeded to operate the Canadian nickel mines, on the plea that their country called for armour plate. Wharton, with Christian resignation, "closed the only considerable nickel mine in the United States and submissively [mark the word!] changed his activity from mining and smelting nickel ores to making government nickel steel at his Bethlehem Iron Works. His reign passed to the International Nickel Company, which controls the nickel supply of the world, and, lacking Wharton's shrewd knowledge of trade principles, has tried to force a great supply upon a market that does not exist." Briefly, the nickel trade is moribund, the trust is an aggregation of visionaries, and there is no balm in Gilead.

That our readers may be able to appreciate fully the playful inversion of fact in the foregoing obituary, we shall skim lightly over the early and actual history of Mr. Wharton's connection with nickel. This is what truly befel. In the year 1863, Mr. Wharton purchased the Lancaster Gap nickel mine. The ore was exceedingly low grade, carrying only 1½ per cent. nickel. In the same year he started his nickel works at Camden. When, in 1887, the Canadian Copper Company put their ores on the market, Mr. Wharton immediately and naturally purchased these in preference to his own. Consequently the output from Lancaster Gap diminished.

Two years later, Mr. Wharton commenced to purchase matte from the Canadian Copper Company. As this was by far the cheapest way for him to obtain raw material, he decided, in 1891, to close the Lancaster Gap mine. Mr. Wharton's "vigorous protest" is, therefore, hardly visible to the naked eye. We may add that, when the International Nickel Company was organized in 1902, Mr. Wharton was one of the active promoters. And we are not credibly informed that he ever saw grave conflict between duty and pleasure, in accepting additions to his bank account from the corporation.

So much for Dr. Day's Quaker patriot. As for the International Nickel Company, we regret to state that, notwithstanding the crass stupidity of its directors, it has increased its business by 40 per cent. within the last twelve months. We hardly know whom to blame, but we fear mightily that one funeral at least will have to be postponed *sine die*.

RECIPROCITY ONCE MORE.

On another page will be found a letter from Mr. G. H. Gillespie commenting upon our attitude towards reciprocity. Mr. Gillespie, being vitally interested in better trade relations with the United States, is an out and out free-trader. Against heavy handicaps he has built up a considerable business in one mineral commodity. Like many other ambitious operators, he is anxiously waiting for the chance to get into the United States markets on equal footing with United States operators. Mr. Gillespie's opinions are coloured by his business interests. This does not in the least detract from their value; in fact, it lends force and sincerity to his argument.

Before touching upon our correspondent's letter, it is appropriate to make a few remarks upon the question of reciprocity as a national issue. And, since our newspapers are the prime moulders of public sentiment, we must here and now express our extreme distaste for the kind of childish twaddle that is being circulated by the partizan elements of the daily press. The worst offenders are in the ranks of the opposition. The silly fiction that United States politicians are conspiring to wrest our heritage from us is as baseless as it is absurd. As well might Diaz have designs upon the throne of England. The equally febrile fancies that a modicum of free trade corrodes our loyalty to the Empire and implies commercial ruin, are not worthy of serious consideration. Loyalty and nationhood are not functions of tariffs. Neither is a tentative measure of reciprocity a menace—it is merely a political lever for opening new channels of trade. The men who have brought it about are not traitors—they are merely much harassed politicians, who are doing their utmost to mend an exceeding bad tariff. And, in so far as the mining industry is affected, they have mended and not marred. That there is anything sinister in this we cannot believe.

Canada's total trade with the United States amounts to about $355,000,000 per annum. Of this amount, exports to the States from Canada total $115,000,000; whilst imports from the States run up to $245,000,000. Contrasting this with our trade with the whole British Empire, we find that the total imports and exports are only $277,000,000. Imports from the British Empire amount to $112,000,000; and exports from Canada to all other parts of the Empire are put at $165,000,000. Thus our total trade with the United States is 22 per cent. larger than our trade with the whole of the British Empire. And it is to be noted that as regards the States there is a balance of trade against us of $130,000,000; whilst within the Empire the balance to our credit is $53,000,000.

In view of these facts it appears that, under existing tariff arrangements, we are certainly not on a satisfactory basis with our largest customer. Reciprocity, *per se*, is obviously to be desired. Reciprocity, as arranged at Washington, may or may not give us the worst of the bargain. That is a matter to be determined by the passage of time, and by the statesmanship of our ministers.

Meanwhile, the point made by Mr. Gillespie is strong. If too few concessions have been made to the mining industries, we have ourselves to blame. What concessions have been granted may be credited to a few active individuals who are enterprising enough to see when and how their bread is buttered.

UNDERGROUND VISITORS.

By no means unmixed blessings are visitors in mining camps. Especially during booms, mine managers and superintendents are too frequently pestered by a horde of persons who wish to go underground. In this country the rule practically is either to have the mine open to everyone, or to admit no one underground. This arrangement does not work well. While a manager cannot be blamed for declining to waste the time of himself or his staff in showing through the mine numerous visitors, many of whom are entirely ignorant of mining and are influenced merely by idle curiosity, still professional etiquette requires that men having a knowledge of mining or of ore deposits should be afforded facilities for visiting the underground

workings. This is best for science and best for the company. Yet the casual visitor is an unmitigated nuisance. Something must be done to exclude him. But is there not a middle road between indiscriminate admission and total exclusion?

One apparently workable scheme suggests itself. Would not the charging of a small fee, say one dollar for each visitor, tend to keep out those who are influenced merely by idle curiosity? Fees collected could be devoted to the miners' hospital, or to a benevolent or accident fund. Before going underground each visitor would be required to purchase at the mine's office a ticket of admission. Idle curiosity would hardly survive this cold touch, while no trifling levy would deter the responsible inquirer.

Some years ago the subject was dealt with by the president of the Institution of Mining and Metallurgy as follows:

"When dealing with this subject, I should like to make a vigorous protest against the system, now happily becoming more and more rare, of closing mines to the public. No doubt in each case where it is being done, or has been done, plausible reason can be given. I think, however, there is a great deal of sound common sense in the old, but somewhat homely, saying that the 'proof of the pudding lies in the eating,' and in this sense the result has, in the majority of cases, been unfortunate for the general public. If a mine is owned by an individual, or a few large shareholders, there is, no doubt, a perfect right to close it against visitors. In the case, however, of a mine which is owned by a public company, the shares of which are actively dealt in, and which the public are invited to buy and sell freely, the same argument, I maintain, does not apply.

"Personally, I always regard a mine which makes great difficulty about letting visitors go underground, and will not give information freely about the workings, and so on, with the very greatest suspicion, and have found that events usually justify that view. In the last four or five years three mines have come under my notice which were subsequently the cause of a so-called mining scandal, and it is worth noting that in each case great mystery was made about giving any information concerning the workings to visitors, and difficulty was made in regard to going underground.

"It would appear that if anything is kept concealed about a mine, some astute individual is pretty sure sooner or later to turn it to his own advantage at the expense of the public.

"A system which seems to have a great deal to recommend it, is for the manager to be empowered to regard all information regarding his mine as open to the public, after it has been reported to the head office, and sufficient time has elapsed to allow for its publication. This system is being acted on in some of the best-managed mines, and I have not heard the managers complain about it, while the protection thereby afforded to the public is very considerable."

Without a doubt we suffer from both extremes in Canada. The wide-open mine is too often burdened with giggling "trippers"; the mine that is sealed to the public is made the object of false and injurious rumours. Examples of the latter are not far to seek. Both extremes are costly; both are unfair and unwise.

The imposition of an admission fee would place the visitor in a better position. It would remove from his mind, in part at least, the feeling that he is getting something for nothing. It might also, as suggested above, do something to ameliorate the hardships that miners too often have to tolerate.

THE STANDARDIZATION OF MINE ACCOUNTS.

Following up its excellent work in the direction of standardizing, the Institution of Mining and Metallurgy now publishes the report of a special committee on mine accounts and cost sheets.

The report mainly deals with the allocation and grouping of expenditure, and lays down certain principles, adherence to which will, amongst other advantages, facilitate the comparison of costs at different mines. It is frankly acknowledged that absolute uniformity is not to be hoped for; but the same general plan can be followed by all operators.

Capital account, profit and loss, working accounts and cost sheets, are the heads under which the report is divided.

Under capital account fall all expenditures before the producing stage is reached. It is recommended that all main shafts or adits be charged direct to capital. Incline shafts that develop ore, subsidiary shafts, winzes or other workings that have assisted ore development, should be charged to underground development, and may remain chargeable to capital or be treated as a temporary development account. All other expenditure before production is attained should be placed in a "general expenditure account"; after the producing stage is reached these should be distributed proportionately after deducting any revenue that may have been received.

After the producing stage is reached, only large special items should be charged to capital account. Purchase of additional property, sinking of new main shafts, the erection of new building, and the purchase of new plant, are the items specified here. All repairs, minor replacements, and all maintenance are to be charged to working costs. The report strongly condemns the charging to capital account items that should be included in working costs.

When production has commenced, all underground work should be charged to development account; or, as an alternative, all development may be treated as a temporary account, in which case this temporary account is to be gradually extinguished by progressive transference to the working account.

Bullion, concentrates, and other marketable products should be shown as assets in the balance sheet and

credited to revenue account at net valuation. Unfinished products should be reckoned only at cost, provided such cost does not exceed market value.

Depreciation, as regards the mine, should be covered by special reserve funds, accumulated out of revenue. As regards machinery, plant, etc., suitable provision also should be made from revenue. The percentage written off should be based on original cost, and not on the balance standing in the books at any subsequent date.

Eight main heads are recommended for classifying all expenditure. These are:—1, Development. 2. Extraction of ore. 3. Sorting at surface, preliminary crushing, and transport. 4. Reduction costs. 5. Administration charges and general charges at mine. 6. Realization charges on products. 7. Taxes and royalties of all kinds, shown separately. 8. Head office charges. Each of these heads is discussed separately. There follows a lengthy memorandum covering each item exhaustively. This, together with the general report, will be reprinted in a later issue of the Canadian Mining Journal.

Comparison of the annual reports of Canadian mining companies proves at once the fact that few such companies follow any rational system of accounting. In fact, the whole responsibility is usually left on the shoulders of an accountant at the head office who may never have seen a mine in his life. Not only is the result grievous to the shareholder, but all possibility of arriving at actual costs is precluded. Capital account is handled in surprisingly various ways. Working costs are frequently artificially reduced by padding capital charges. In divers other ways the annual statement is robbed of meaning and value.

A careful perusal of the report will go far towards removing the misconceptions that now mar the work of mine accountants. But the most important conclusion that can be reached is that the engineer in charge must concern himself in the allocation of expenditure much more than he does at present.

THREE COMPANIES.

To satisfy many inquirers we present here a few facts relating to three of the large mining corporations that have displayed practical interest in the Porcupine gold district.

The Anglo-French Exploration Company, Limited, was organized in 1889. The authorized capital is £1,000,000, in 500,000 preference and 500,000 ordinary shares of £1 each. The dividends paid on ordinary shares, since 1893, have ranged from 8 per cent. to 50 per cent. For three years, 1905, 1906, and 1907, no dividends were declared. In 1908, 10 per cent., and in 1909, 12½ per cent. dividends were distributed. Profits for the calendar year 1910 amounted to £242,333. Mr. William Frecheville, who visited Porcupine last autumn, is a director. Mr. J. B. Tyrrell, Toronto, is retained by the company to look after its Canadian interests.

One of the early purchasers was the Consolidated Gold Fields of South Africa, Ltd. This company was organized in 1892. Its authorized capital is £3,250,000, divided into 1,250,000 six per cent., cumulative preference shares of £1 each, and 2,000,000 ordinary shares of £1 each. Dividends on the common have ranged from 12½ per cent. to 125 per cent. The last three annual distributions were respectively, 20 per cent., 35 per cent., and 35 per cent. The net profits for the year ending June 30, 1910, were £993,382. Mr. H. H. Webb, the company's consulting engineer, was its representative in Porcupine.

The third of the trinity is the International Nickel Company, whose property, the Dome, has been much in the public eye. The International's authorized capital is $24,000,000, in 120,000 six per cent., non-cumulative preferred, and 120,000 ordinary shares of $100 each. There are also $8,912,836 five per cent. debentures, part of an issue of $10,000,000. Since September, 1909, one 1 per cent., and five 1½ per cent. dividends, together with an extra declaration of 25 per cent. last July, have been paid on the common. The last annual report shows a profit of $2,067,528 for the year.

There is something extremely impressive about the history and standing of such companies. The fact that they are taking Porcupine seriously is worth more than numberless pages of newspaper touting. If the investments of the two British companies are successful, it is to be hoped that other Canadian districts will attract their attention. Distinctly it is this class of investor that we should encourage.

GOWGANDA'S GRIEVANCE.

The large delegation that waited upon the Premier of Ontario and his Ministers a few days ago, presented forcibly the claims of the Gowganda mining region for a government railway. The powers, though impressed, were not inclined to give immediate consent. It was decided that full investigation would be made. High hopes are entertained that Gowganda will be connected by rail with the outer world.

The Ontario Government in this instance is wise in taking its time. Some of the claims put forward by the delegation were unwarranted, and some of the statements made had little basis in fact. Gowganda does need transportation facilities. There is no doubt whatever of this. But calm deliberation brings us to the conclusion that a well built wagon road would meet all present requirements.

It is to be regretted that the Government wasted so much money on the road as it now stands. We are confident that, had the appropriation been carefully expended, the whole road from Charlton to Gowganda would now have been in excellent shape. Instead of this, there are long stretches of bare corduroy and only a minimum of good road. The Government is morally

bound, both for its own sake and because of its duty to the country, to retrieve this blunder.

Whether the Government is or is not called upon to build a railway remains yet to be demonstrated. The delegation's representations were vehement rather than eonvincing.

NOVA SCOTIA STEEL AND COAL.

If we may accept the annual report of the Nova Scotia Steel and Coal Company at its face value that corporation has had a really suecessful year. For the calendar year ending December 31st, 1910, a profit of $1,140,504.37 is shown. Reduction in fixed charges will now put the company in a position to bring its dividend on common up to 6 per cent. During the year additional capital to the extent of $1,500,000 was secured, but fixed charges were reduced by $50,000.

The financial statement sets at rest many adverse street rumours. The company is apparently sound financially. There is no question as to the value of its physical assets.

EDITORIAL NOTES.

Mr. John Hays Hammond has been appointed special ambassador for the United States at the coronation of King George. At that function Mr. Hammond will renew some warm South African friendships.

A two-page advertisement of the Eneyclopædia Britannica will be noticed in this issue of the Canadian Mining Journal. It is well worth study. The mechanical exploit of reducing these volumes to easily portable size is a triumph of modern book-making. Particularly interesting to mining and metallurgieal engineers is the list of contributors on subjects touehing their professions. Dr. J. S. Kemp, Dr. H. M. Howe, Dr. H. S. Munroe, Prof. R. Peele, Mr. Walter Hunter, and many others write on technical topics. As the Encyclopædia is also a compendium of nearly all human knowledge, and as the price set is well within the means of the majority of professional men, it should decorate many libraries.

Correspondence

Editor Canadian Mining Journal:

Sir,—I have read your editorial in Feb. 15th issue of the Canadian Mining Journal with a good deal of disappointment. The action of the Government, so far as it affects the mining industry, in my opinion calls for approval rather than for somewhat eryptic eomment.

I have reason to believe that your statements in the first part of your editorial concerning sulphite pulp are hardly correct. Are you aware that a good deal of sulphite pulp is at present made in Canada, and that not a pound of sulphurie acid is used for this purpose?

When you speak of genuine reciprocity, what do you mean, or has this sentence any meaning? Here I may instance the following mineral industries:—Canadian talc has free entry to the United States; so also have feldspar, fluorspar, and ground and crude mica. It is possible that with these concessions important new industries can be built up in Canada. Talc and feldspar which are exported largely in crude form, can now be ground in Canada. Fluorspar, which was practically worthless by reason of the inaccessibility of the Canadian market, can now be mined, milled, and shipped to Buffalo and Pittsburg, the natural market on a short rail haul. The Canadian industries that use fluorspar are not handicapped by having to pay a duty, and can now obtain their supply from British and American sources that are nearer them.

Are you aware that the real effect of the proposed measure of reciproeity is that we get free entry to half a continent on equal terms with American producers, and in that territory get the same protection from European competition as do United States produeers themselves? The United States tariff on ground talc is $20 per ton, on fluorspar $3 per ton, on feldspar 20 per cent. ad valorem, and on mica some $120 per ton. These are to be removed. In return for this the United States gets entry into our limited market, where it has to compete with European products that are not protected. European talc, fluorspar, mica, and feldspar have free entry into Canada.

Does this look like bad business from a mining standpoint? In your editorial you appear to be under the impression that the concessions made in favour of the mineral industry are too few. This is true, but who is to blame for it? Not the responsible minister, but those interested in the mineral industry, who were so indifferent that they made no representations at Ottawa. nor did they indicate what they desired. Had the whole field of the mineral industry been represented, I venture to say you would have seen a free list that would have covered all economic minerals.

Why blame the "temporizing politician" for what is obviously the fault of the industry? You ean hardly expect people to negotiate if they are not supplied with data to negotiate on. You cite the case of gypsum. I believe this is a case where there is no urgent need for change. There is now a sufficient home market to justify the construction and operation of a plant to supply the home market without the necessity of looking to a foreign market.

In my own experience the produetion of Canadian eeonomic minerals suffers from the fact that there is no developed home market. It is difficult, if not impossible, to establish a new industry if dependent upon a foreign market entirely. A business, to be successful, must have a substantial nucleus in its home market; the more so as all reduction or refining processes produce large quantities of by-produets, which will not stand transportation. The solution of this diffieulty in Canada is the free entry of such products into the United States market, which as it fills most of the requirements of a home market since it is easily aeeessible and is analagous in many respects to our own. It appears to me that, as the organ of the mining interests, your policy would be to endorse a bargain and the Government that made such a bargain, when that bargain aids some sections of the industry and harms none.

In due course of time I have no doubt that the limited reciprocity of the present arrangement will be extended to eover the full mineral industry to the great advantage of all eoncerned. Why not come out solidly for or against?

Yours, etc.,

G. H. Gillespie,
Madoc, Ont.

February 20th, 1911.

BOOK REVIEWS

DESCRIPTIVE MINERALOGY — With Especial Reference to the Occurrences and Uses of Minerals—By Edward Henry Kraus, Ph.D., Professor of Mineralogy, etc., University of Michigan—334 Pages—Blank Interleaves Throughout Text—Price $2.75—Published by George Wahr—Ann Arbor, Michigan, U.S.A., 1911.

Doctor Kraus has departed from the lines followed by Dana, and has followed the classification suggested by Groth, in which the simplest minerals are discussed first and the more complex, especially the silicates and allied compounds, last. No attempt is made to cover either optical mineralogy or rock minerals. The inclusion of information as to uses of minerals and statistics of production lends little value to the text.

The minerals are grouped according to their chemical composition and to the important principle of isomorphism. Ten classes are made:—

1. Elements.
2. Sulphides and analogous compounds.
2. Sulphides and analogous compounds of selenium, tellurium, arsenic, antimony, and bismuth.
3. Oxides, hydroxides, etc.
4. Haloids.
5. Nitrates, carbonates, etc.
6. Sulphates, chromates, molybdates, tungstates, and uranates.
7. Borates, aluminates, etc.
8. Phosphates, arsenates, etc.
9. Silicates, titanates, etc.
10. Organic compounds.

Dr. Kraus' book has merit. Typographically its arrangement is clear. It gives evidence of careful preparation. We hardly approve, however, of the attempt to convey economic facts by means of statistics that apply only to the United States.

In all probability the volume before us will be found quite as useful (and perhaps more so) for class-room instruction as the heretofore incomparable Dana.

THE MINING MANUAL FOR 1911—By Walter R. Skinner—A Record of Information Concerning Mining Companies—Twenty-Fifth Year of Publication—1372 Pages—Price $5—For Sale by the Book Department, Canadian Mining Journal—17-23 Manning Arcade Annex, Toronto, Ont.

Mr. Skinner's Mining Manual has frequently received notice in these columns. The 1911 edition, which has just reached us, is even more complete than its predecessors. And this is not faint praise.

As British and foreign capital is now coming into Canada at an unprecedented rate, and as numerous investors, promoters, engineers, and others are constantly in need of information concerning outside mining corporations, the Mining Manual supplies exactly what is needed. For instance, when newspaper despatches mention that prominent English investors are *en route* to Porcupine, or to Portland Canal, or to Cape Breton, the standing of these investors, or the history of their corporation can be discovered at once.

Within the volume are given particulars of 3,120 mining companies operating in all parts of the world. These particulars are concise and inclusive. The promoters, vendors, purchase consideration, and other such items are specified. Lengthy lists of directors and mining secretaries, and names and addresses of mining engineers, are also included.

We have no hesitation in warmly commending the Mining Manual to all our readers. Not only is it a convenience, but it is also highly educative.

Western Branch C.M.I.

The ninth general meeting of the Western Branch of the Canadian Mining Institute was held at Nanaimo, Vancouver Island, B.C., on February 16th. Two sessions were held—afternoon and evening—and these were well attended, and the proceedings proved of much interest.

Mr. W. F. Robertson, provincial mineralogist for British Columbia, chairman of the branch, presided. At the afternoon session the visitors were cordially welcomed by Ald. John Shaw (in the temporary absence from the city of Mayor Planta).

The chairman suitably acknowledged the cordiality of the welcome extended to the visitors. Mr. E. W. Parker, statistician in charge, Division of Mineral Resources, U.S. Geological Survey, responded to the chairman's request that he say a few words.

The first paper read was by Mr. Chas. Graham, superintendent of the Middlesboro Colliery, Nicola Valley, on "First Aid; Its Relation to Coal Mining." Mr. C. F. J. Galloway, B.Sc., next gave a synopsis of a lengthy compilation of reports on "Coal Mining in British Columbia."

In the evening the attendance included a number of coal miners desirous of hearing an address, by Mr. F. Napier Denison, F.R.M.S., of the Meteorologieal Office, Victoria, B.C., on "Earthquake Strains and Stresses in Relation to Coal Mine Explosions." This address was illustrated by lantern-slide views and diagrams.

During the evening the chairman presented five certificates courteously sent by the Dircetor of the U. S. Bureau of Mines, to the Provincial Department of Mines for men from British Columbia who had successfully taken the prescribed course of training in mine-rescue work at the U. S. Mine-Rescue Training Station, Seattle, Wash.

The secretary read from the Canadian Mining Journal the particulars published in its issue of February 1st relative to the late Fred Alderson, who heroically gave up his life to save an Italian miner at the Bellevue Colliery, Alberta, last October, and a resolution was adopted expressive of appreciation of the action of the Government of British Columbia in contributing $500 to the fund for the benefit of the late Mr. Alderson's widow and orphans. On a lantern-slide picture of Mr. Alderson being thrown on the screen, all present stood as a mark of respect to the memory of a brave man. Mr. Thos. R. Stockett, manager of the Western Fuel Company, informed the meeting that $600 had just been remitted as the contribution of the miners and officials of the local mines to the Alderson benefit fund.

On Friday a demonstration of the use of the Draeger oxygen breathing apparatus by men working in a chamber filled with irrespirable gases, was made at the Western Fuel Company's No. 1 mine. Afterwards a visit was paid to the Malaspina gallery, on Gabriola Island, near Nanaimo, which interesting phenomenon, formed by the action of the waves of the sea on the sandstone cliffs, near the entrance to Nanaimo harbour, was discovered in 1792 by Spanish naval offieers, Galiano and Valdez.

Saturday morning's train and steamer took the visitors away from Nanaimo *en route* to their respective homes, after one of the most pleasant and instructive meetings the branch has held.

At the Mount Bischoff mine, Australia, 19,000 tons of tin ore are treated per month. The average tin content is less than one per cent. The extraction is 90 per cent. By Cornwall practice only about 60 per cent. of the contained tin is recovered.

The Advance Made in the Manufacture of Peat Fuel in 1910

(Written for the CANADIAN MINING JOURNAL by ERNEST V. MOORE.)*

Much has been written from time to time, in Canada, on the subject of peat fuel manufacture. Outside of what is found in promotion literature, which is always interesting, some of the articles have been both interesting and constructive; but many of them have been simply a re-hash of peat platitudes accompanying descriptions of old machines in new words. The purpose of this article is to give some idea of what has been accomplished in 1910 that is new, in Sweden, but more particularly in Canada, and from an analysis of this work to make an attempt to overcome the suspicion and prejudice with which the investing public view anything connected with peat products, and to establish, if possible, instead, the feeling of confidence which the present conditions warrant.

After much pioneer work and extravagant experiment the practically unanimous concensus of opinion of those who are in a position to know, is, that it is folly to attempt to make peat fuel by any method other than what is known as the manufacture of machine peat. Owing to a natural peculiarity of the raw material, peat, if it is excavated and, while still containing 85 per cent. to 90 per cent. water, thoroughly macerated and pugged into a homogeneous plastic mass, and then moulded into convenient pieces and left out in the weather to dry, it dries and condenses into a piece of fuel, harder, tougher, and of higher specific gravity than the same raw material will make by any of the well-known and well-tried methods of artificial drying and briquetting. Further, peat so made differs from these briquettes in that the dry mass of machine peat is practically non-hydroscopic and will weather in a pile quite as well as coal. The operation, then, simply consists in excavating the raw peat, putting it through a machine that will macerate and grind it up, and then spreading it out in a layer of proper thickness to dry. Next, the layer is cut in two directions at right angles to each other into blocks of convenient size. Provision is made to leave the mass so spread exposed to the summer weather for from three weeks to two months, depending on the time of year and the dryness of the season. During this time these blocks may or may not be turned over and piled in little heaps as is found necessary. When dried down to about 25 per cent. to 18 per cent. water content, the peat is harvested into a storehouse, directly onto the railway cars, or built up in stacks on the drying field a finished fuel ready for the consumer.

All these operations are very simple, being little different from those almost any large contractor successfully performs almost every day in the year, and the problem, if problem there be, is simply how these operations may be carried out most cheaply. The question to answer is: With the methods available at present can these operations be carried out at such a cost as to make a commercial profit?

The experience of the Department of Mines would go to show that machine peat fuel will sell readily at $3.25 per ton at Ottawa, where the prices of ordinary fuels may be taken as about average. The writer found, in selling about 1,000 tons, that there is a brisk demand for this fuel for domestic purposes and more particularly for cooking, for the grate, and as a kindling for the furnace, at $4.00, but taking the lower figure the above question becomes a definite one. Can machine peat be manufactured to sell at $3.25 per ton and afford the manufacturer such profit as to make the operation an attractive one?

There are a number of conditions which enter into the answer to this question that it is not intended to consider here, as the peat surveys of the Government, already made, show that there are a number of peat bogs where the quality of the raw material, the drainage possibilities, the condition of the surface, and the shipping facilities are all satisfactory and these bogs are located within say a fifty cent freight rate of centres of population and therefore of consumption, and so these elements will not be considered at present.

The phrase "cost of manufacture" requires a word of explanation here. It has been used in two senses without any intention to mislead, and yet this has caused many discrepancies in figures apparently very hard to reconcile. Many peat operators speak of "cost of manufacture" and have in mind only the cost for labour, power, and supplies necessary to produce a ton of peat fuel. This is the net cost of the manufacturing process, the total cost to the man or company intending to make money out of the operation must include a number of overhead charges such as management and superintendence, office expenses, depreciation, interest on the capital investment, taxes, insurance, etc., all of which must be charged up proportionately to each ton of output. These items make up a very different figure from the first one spoken of. In a small plant these elements may be equal to, or even greater than the first; and hence, in considering a small installation like that operated at Alfred, Ont., this year by the Department of Mines, the most unfavourable conditions are present.

However, this Government plant at Alfred illustrates the general plan that seems most desirable for carrying out the before mentioned series of operations to make fuel; and while the figures of 1910 give an unfair impression as to the success of the industry, nevertheless they are a basis to work from, and any fair-minded man will see for the reasons hereafter given, that they do not represent anything like the returns which may be obtained with this same plant, which is situated on the C. P. Railway short line between Montreal and Ottawa, about a mile east of Alfred station.

The Government bog consists of about 300 acres of raw material classified as fairly good. Before peat manufacture was commenced development work was done. The bog was drained, and about 25 acres cleared of shrubs and bushes and to an extent levelled down to form a drying ground.

The manufacturing plant consists of a complete peat mill, made up of a platform about 8 feet x 24 feet mounted on wheels, which, in turn, rest on 30-pound steel rails supported by 6 or 8 wooden ties, 12 feet long. The rails are in short sections, which permit of their being moved ahead conveniently from time to time as desired. The platform supports a locomotive boiler with special grate and ash pan on which is mounted a 34 h.p. steam engine. This is connected by a belt to an Anrep macerating mill, a device which is essentially a number of knives fixed spirally on a horizontal shaft mounted in a cast iron case. Each knife has a forward pitch to force the peat

*Mining Engineer, A. M. Canadian Society of C. E. Peterboro, Ont.

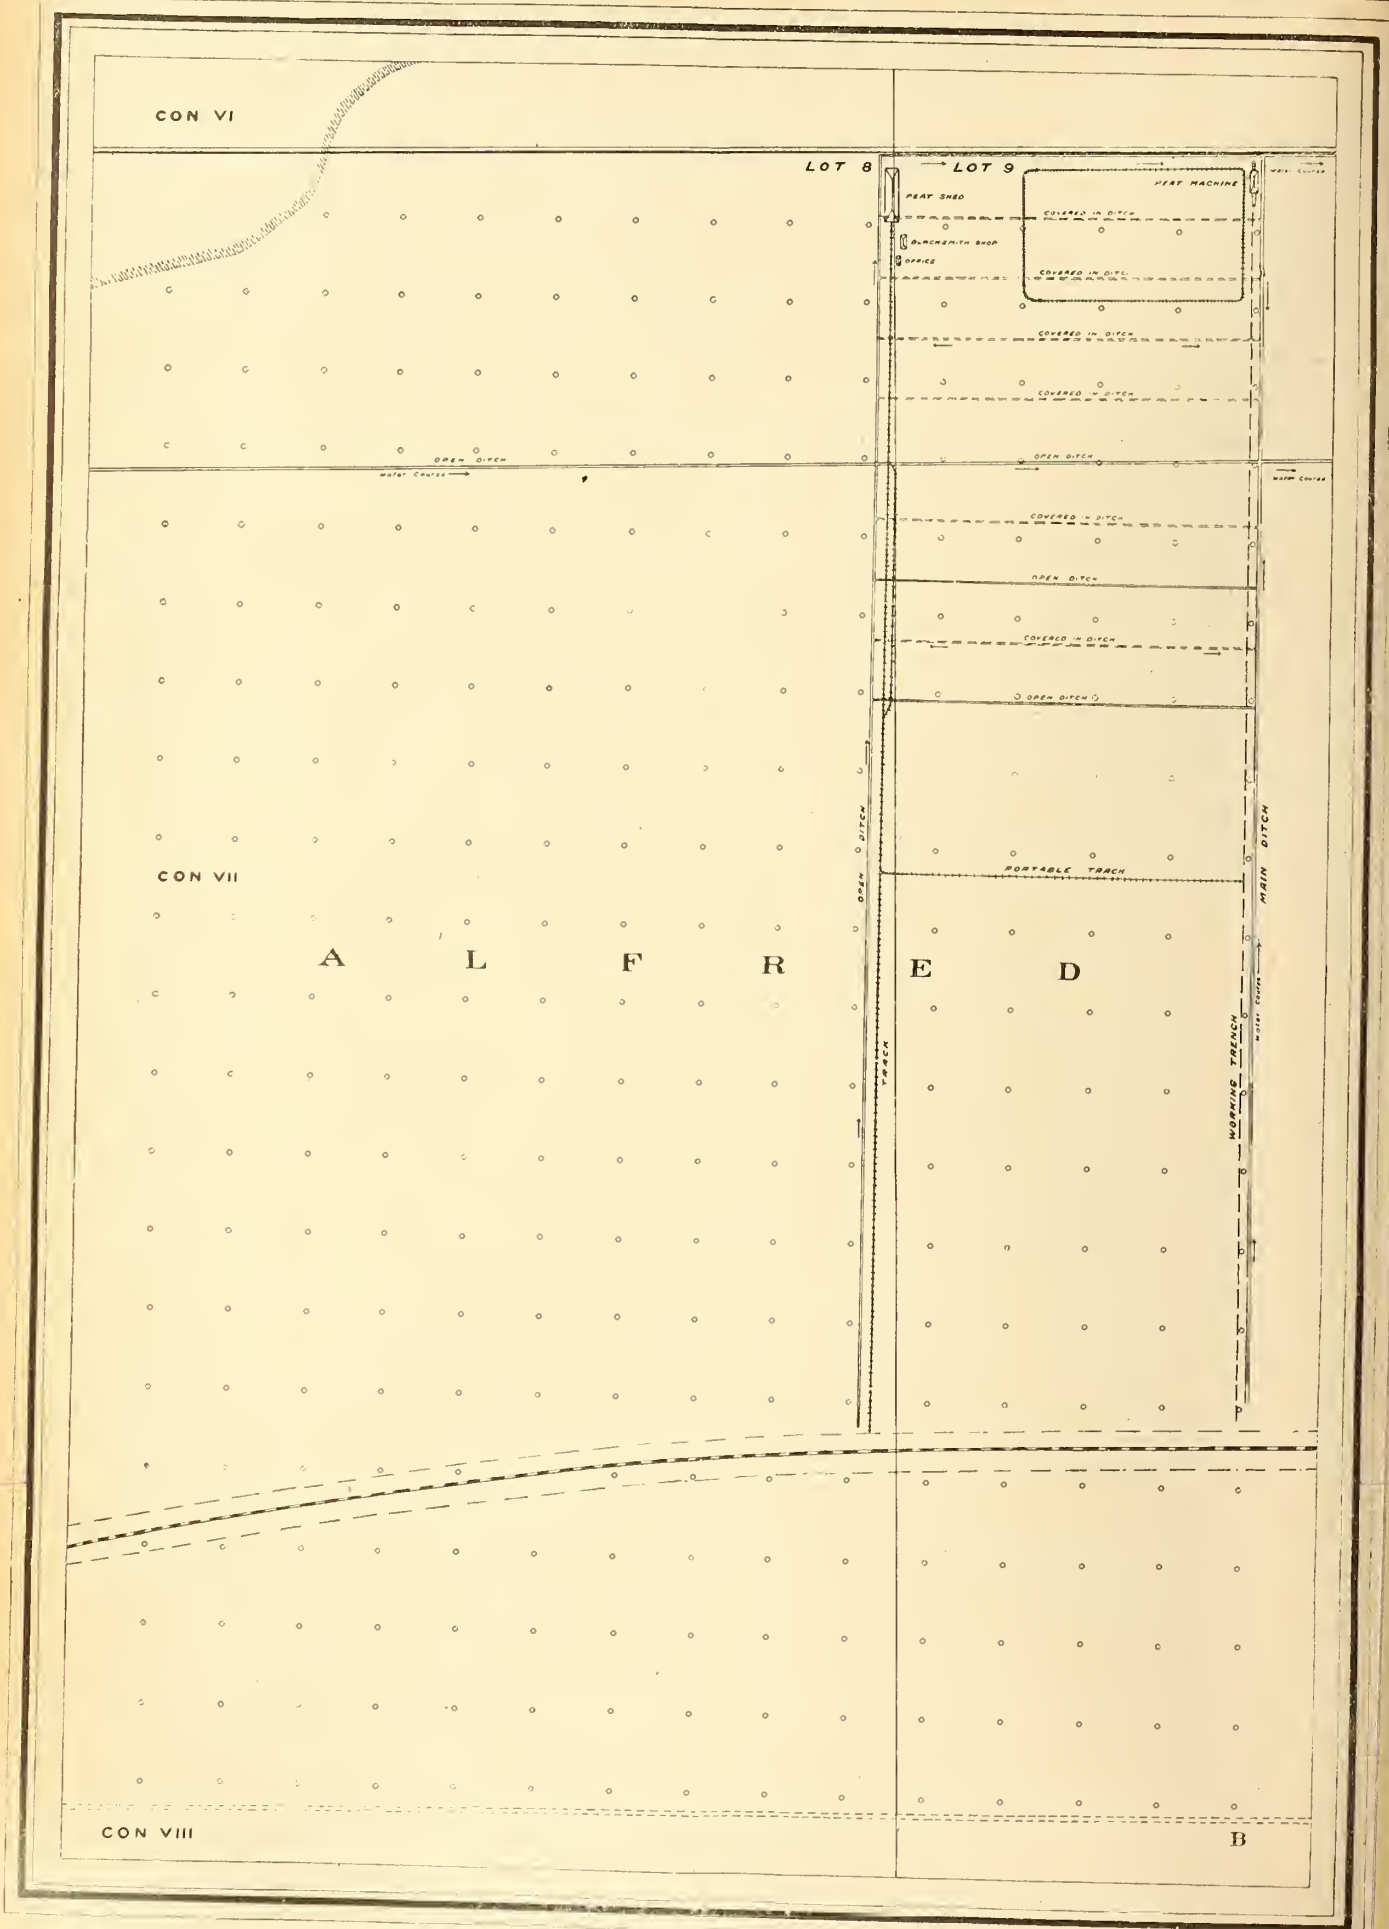

Fig 1

Plan of Government Peat Bog, Alfred, Ont.

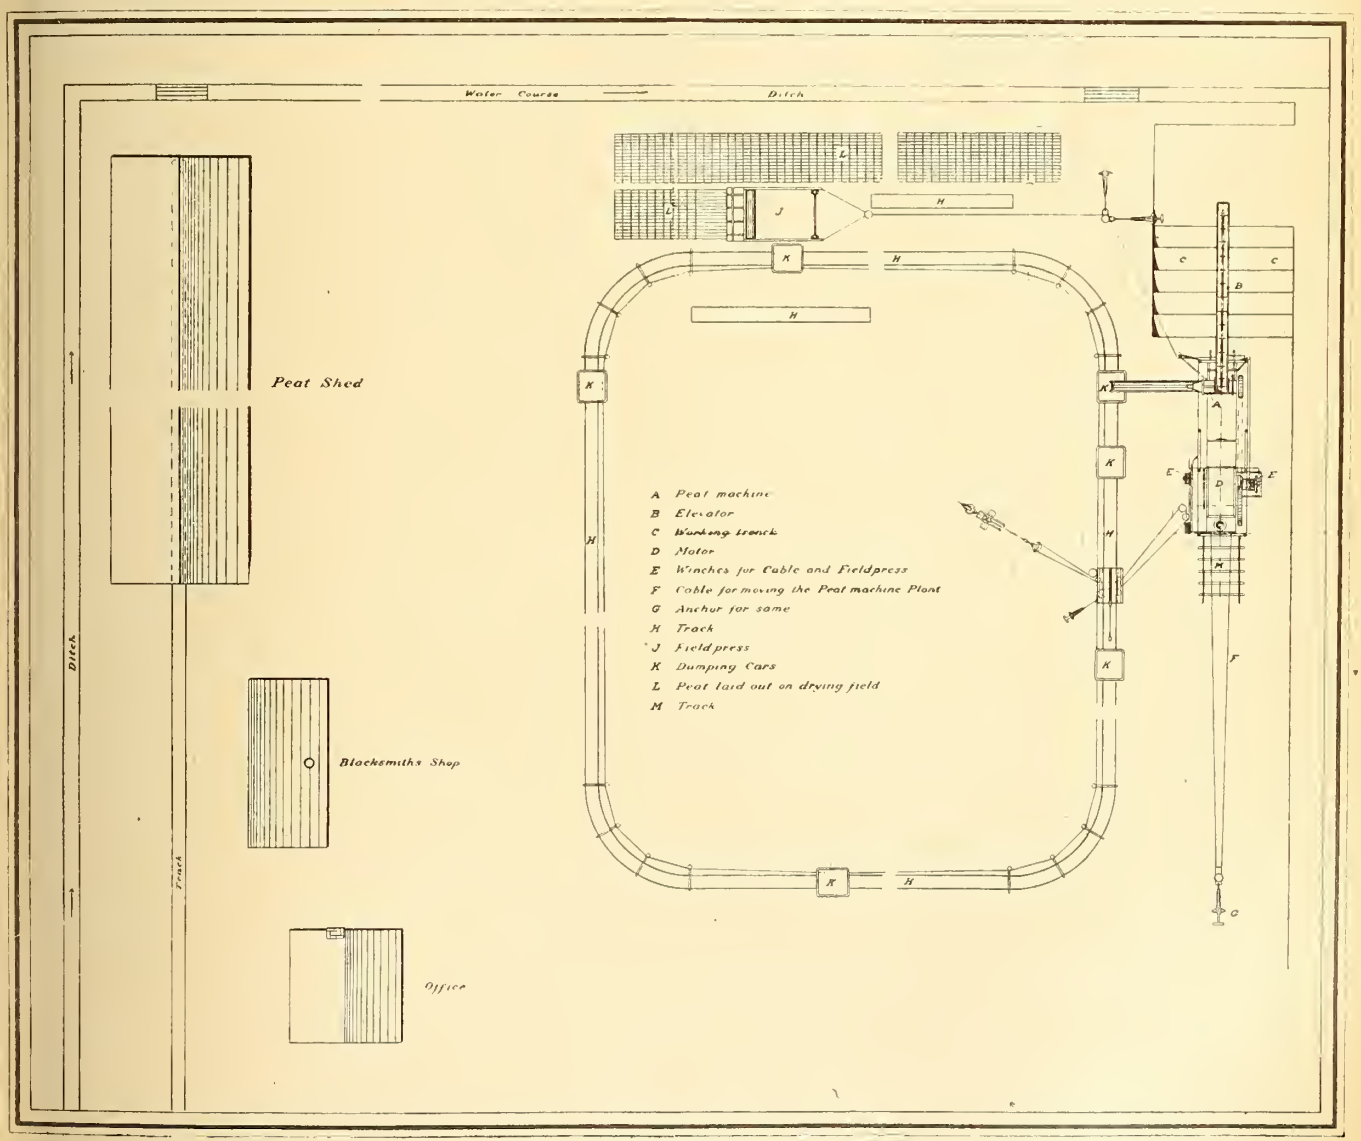
pulp out of a delivery spout, and works against a fixed knife so as to cut up any small roots or fibres remaining undecomposed in the peat, and also to perform a kneading operation. To this mill is attached an elevator extending in a downward sloping position for about 35 feet behind the platform where it is convenient for the shovellers to load into. The platform also supports a number of driving spools to give motion to a cable used to haul the cars which take out the peat pulp, to pull by another cable the device used to spread the pulp, and to pull the whole mill ahead from time to time, which is done by anchoring a cable out ahead and winding in.

A belt conveyor is arranged to carry the peat pulp from the mouth of the macerating mill to a convenient place to load the pulp cars, and the whole mill is protected from the weather by a light housing.

Besides the mill proper there are 8 side-dumping steel cars about ¾ cubic yards capacity, mounted through roller bearings, on double flanged wheels. There is also sufficient 24-inch gauge 12-pound rail portable steel track with steel ties to make a rectangle about 600 feet square and have 600 feet to spare. Quarter-turn curves, mounted so as to be complete in themselves, are used for corners, the whole track being in sections easily moved. Around this rectangle is stretched a small cable which is carried around the corners on pulleys, as is done in many other systems of cable haulage. A device is provided that automatically takes up the slack and keeps the tension right as the tracks are moved.

Finally a spreading device, called a Jackobson Field Press, is provided. It is a simple contrivance made of wood and composed of a front part which receives the peat pulp direct from the dump cars, a middle part which smoothes it down into a uniform layer, and a rear part which, by means of wooden knives weighted to cut through the peat, divides it into longitudinal strips. The press is provided with a cable leading in to the mill, which passes through a snatch block held in place by anchors, so that the press may move parallel to the track along which the cars of pulp come. To complete the equipment a tool is provided, made of three metal disks supported on an axle about 10 inches apart, and attached to a handle so that an operator, by dragging it across the peat laid out by the press, cuts the longitudinal rows crosswise into bricks, the length of which is determined by the distance apart of the disks.

Outside of this equipment five cars to transport the dried peat into the storehouse or to the railway siding, and nearly a mile of narrow gauge track (24-inch), two storehouses 160 feet x 22 feet, a blacksmith shop and tool room, and a small building for an office, have been provided. This covers the entire equipment.



Plan of Government Peat Plant, Alfred, Ont.

The operation during the 1910 season was as follows: A working area about 700 feet wide was chosen parallel to a main ditch which runs north and south. The peat mill put in place at the north end of this area, immediately adjacent to the ditch; so that the working trench excavated simply widened it out. Seven men began the excavation, which was approximately 20 feet wide and up to 9 feet deep, with spades, shovelling into the elevator which conveyed the raw material to the macerating mill, which in turn delivered it thoroughly pulped into a homogeneous mass, about the consistency of fresh mortar, into the dump cars. The boiler and engine were looked after by an engineer, and peat was used for fuel, about 8.8 pounds being used per h.p. hour. Two boys were used to gather this fuel and carry it to the boiler in baskets (a very costly operation). Two attendants watched the cars being loaded, clamped them to the moving cable, and put empty cars in place. These loaded cars then moved out automatically to the field press where a third attendant disconnected the cable and dumped the pulp into the field press and in his spare time cut the peat crosswise. One man attended the field press, and a boy at the mill attended to levers operating it while one other man was provided to assist in moving track and other work as necessary.

The 600-foot rectangle was laid out immediately adjacent to the mill, one side being parallel to the working trench and just far enough away so that the cars came under the delivery end of the conveyor carrying the pulped peat. The field press was at first placed at the northwest corner of this rectangle and just north of it so that in working it moved from west to east, parallel to the track, and such distance from it that the peat pulp was dumped directly into the front part.

The operation continued in this way until the row, i.e., the full length of the north side of the rectangle, was completed. In the meantime another track was laid parallel to the side along which spreading was going on, and just the width of the field press from it, so that as soon as the first row was complete, all that was necessary was to move the corner curves, tighten up the cable, and having brought the field press back to the west side again, the operation was repeated. The track used for the first row was taken out of the way of the field press as it moved along, and placed again inside the now working track. While the tracks were being shifted it was arranged to shift the main mill also to keep it a convenient distance from the working face.

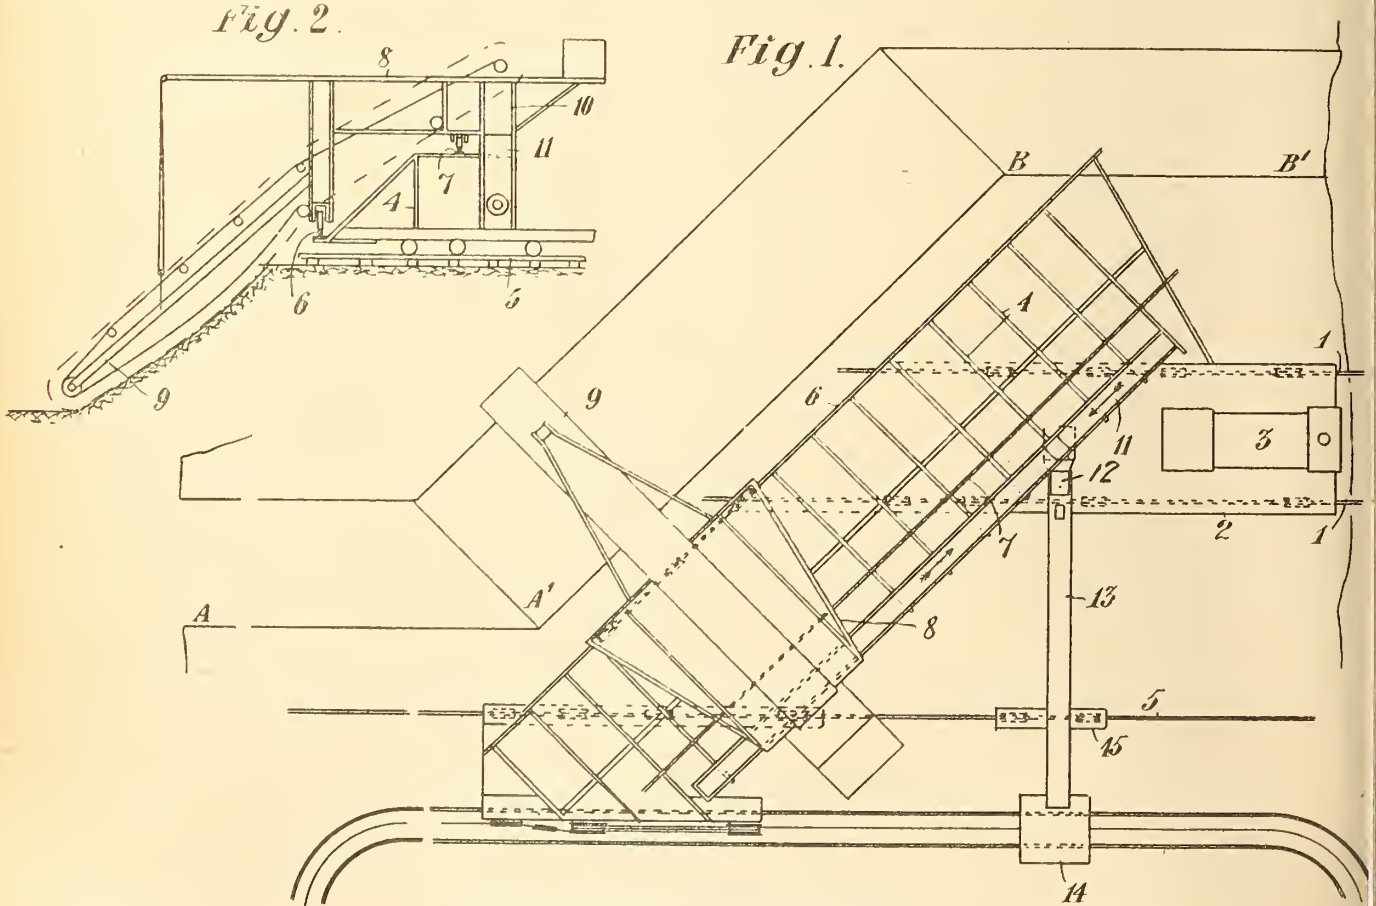
When in the course of the operation the north track approached too close to the south side, the whole rectangle was reconstructed again to the south, this work being preferably done on a rainy day or during some delay.

After the peat was so put out to dry all that was necessary was to turn it over in about three or four days. This was done by contract at 7 cents per ton, and later it was piled in small piles (cubed), for a further 10 cents per ton. From these cubes the finished fuel was taken to the storehouse, or to the railway cars, by the other portable track and cars provided for that purpose.

About four strips, 600 feet long, were laid out per day and each strip represented 8 tons of finished fuel. Fifteen to twenty minutes were taken to shift the tracks and couple up complete for another row.

An analysis of a day's work shows the following:

1	Engineer, at $1.75 per day	$ 1.75
7	Diggers, at $1.75 per day	12.25
3	Attending cars, at $1.75 per day	5.25
1	Attending field press and cutting peat crosswise, at $1.75 per day	1.75
1	Moving track etc., at $1.75 per day	1.75



Anrep's Excavating Machine, Patent Sketch.

1 Attending field press (boy), at $1.00 per day	1.00	
		$23.75
Fuel, 34 h.p. at 8.8 lbs. per h.p. hour, 10 hrs. per day. 34x10x8.8 equals 3,000, or 1½ tons per day.		
The actual capacity of the plant was such as to provide sufficient extra fuel to supply this amount. Fuel damaged in moulding or otherwise was used mainly, and as it would otherwise be waste, it is taken as costing only the labour to collect it, i.e.,		
2 Boys, at $1.00 per day		2.00
Oil and supplies, per day		.50
Total outlay for labour, fuel and supplies for one day		$26.25
Tons peat fuel made, 32.		
Actual manufacturing cost to put fuel on the ground to dry		.83
Add actual cost per ton to turn		.07
And actual cost to pile in small piles (cubing)		.10
Actual cost per ton, exclusive of overhead charges, to manufacture a ton of peat ready for consumer		$1.00

For an estimate for commercial purposes there must be added to this a number of other items, and it is due to these items that much misconception and confusion as to the cost of manufacture has arisen. These items are superintendence and management, depreciation, interest, taxes, and such other fixed charges as go on whether peat is being manufactured or not.

At the Government bog, an estimate of these items would be based on a total investment by the Department of Mines of about $16,000.00, made up of

Cost of bog, draining same, and preparing drying area	$4,000.00
Cost of plant, machinery	7,500.00
Cost of buildings and railway siding	2,500.00
Engineering and superintendence of installation	1,500.00
Sundries	500.00
Total	$16,000.00

The overhead items are:

Management, 3 months, at $150 per month	$ 450.00
Depreciation, 5 per cent. on total capital investment, paying it back in 20 years	800.00
Interest, supposing capital borrowed at 5 per cent.	800.00
Other charges	200.00
Total overhead charges	$2,250.00

If 110 days, the average season's work, had been accomplished, there would have been 3,500 tons available over which to spread this sum, in which case there would be:

Overhead charges per ton	.65
Add cost of manufacturing operations	1.00
Cost of finished fuel on the ground	$1.65
Add to put in storehouse, per ton, and	.15
From storehouse to railway cars	.10
Total cost per ton, on cars	$1.90

Only 50 days' work, however, or 1,600 tons, were available at Alfred in 1910 over which to divide this amount, and therefore:

Overhead charges per ton were	$1.41
Add cost of manufacturing operations	1.00
Cost of finished fuel on the ground	$2.41
Cost of finished fuel in storehouse	2.56
Cost of finished fuel on cars	2.66

This estimate is probably a little high, but is not far from the actual expenditure for the first year's work.

There are a number of reasons why these figures will be made much more attractive in 1911. Last year the plant was new and until it became properly tuned up there were many stoppages. The weather in 1910 was exceptionally wet, heavy rains fell on an abnormal number of days, and work was not carried on as late in the season as is ordinarily possible. The drying field was new and comparatively rough, a condition which will not exist in 1911, and a better showing even in the first element of the cost will be made.

Now, just so surely as it is possible for a contractor to move 100,000 cubic yards, say, of gravel, more cheaply per yard than if he had only 10,000 to move, because it pays him to use a different and more efficient plant, just so surely in the operation of manufacturing machine peat fuel the cost necessarily decreases as the output goes up. There are two reasons: first, because the overhead charges do not increase in proportion to the output and are therefore divided over a greater number of tons, and, second, because, as the output increases, it is possible to introduce mechanical excavating and other improved equipment to advantage. This was actually done in Sweden last year.

Lieutenant Ekelund, at his plant at Back, using essentially the same process as is illustrated at Alfred, but introducing mechanical excavating, was able to put his fuel in the storehouse for 92 cents per ton including all charges. Because of his exceptional bog, the bottom being of hard gravel and easily drained practically dry, he installed there (on the bottom) a heavy electrically operated bucket excavator on which he had mounted an Anrep macerator. With this device he was able to do away with all shovellers, which, for his capacity, 80 to 90 cubic yards per hour, would have required up to 24 men. He used the same portable track method of spreading, but used gasoline locomotives to take out the peat pulp in trains of several cars, which was probably more expensive than the cable haulage, both in labour and in fuel. He also introduced spreading apparatus suitable to the increased output.

This improved showing was not due to any new process, but mainly to larger output, and also to mechanical excavation. The only condition in Canada that is not equally or even more favourable than the conditions in

Anrep Machine in Operation at Alfred, Ont.

Sweden, is the cost of labour; but as Ekelund only uses eight men and two boys, an increase of 50 per cent. in wages would increase his cost only 7 cents per ton, so that he would still be under the $1 mark. His excavator is an adaptation of a device designed to handle much heavier materials, and on this account weighs so much as to be suitable only to bogs with a comparatively hard bottom and capable of being very completely drained; but this objection seems to have been overcome entirely in a mechanical excavator for peat designed for this purpose by Mr. A. Anrep, Sr., of Helsingborg, Sweden, the inventor of the machines and of the process used at Alfred.

This device consists essentially in replacing the elevator taking the raw material to the macerating mill on the platform of the plant at Alfred by a bucket excavator mounted on a carriage that automatically moves backwards and forwards on tracks fastened diagonally across the back end of the platform and moving with it. These superimposed tracks project 10 to 15 feet on either side of the platform proper and are supported at their outside ends by wheels moving on extra single rails placed there for the purpose. The excavating apparatus can be raised or lowered at will, and hence the excavation is made up to 40 feet wide and as deep as is desired. In operation the excavator carriage moves all across the working face, and then the whole device, including the main platform, is automatically moved ahead a small distance and the next cut is made on the return trip.

In this way, using light but strong structural steel construction, a large capacity is obtained with comparatively small weight and this weight is distributed over a large area. Besides this, and perhaps the most unique feature of this device, is the part of its design that causes it to leave all the walls round the excavated part with a natural slope, avoiding all tendency to cave in or break away.

Mr. Anrep has also improved his cable transportation to meet the increased output and has introduced a plan whereby a larger spreading device works in both directions, thereby avoiding the lifting and taking back to a starting point as is done at Alfred. The new spreading device also cuts the peat crosswise automatically.

With this new plant the following conditions approximately will exist: According to precedent established in Sweden, the plant will run 20 to 24 hours per day, and as the plant has a capacity of 8 tons per hour a maximum of 192 tons of finished fuel may be put out in 24 hours. Only 150 per day, however, are used for this estimate, and 100 days as the working time. Thus the season's output is estimated as 15,000 tons.

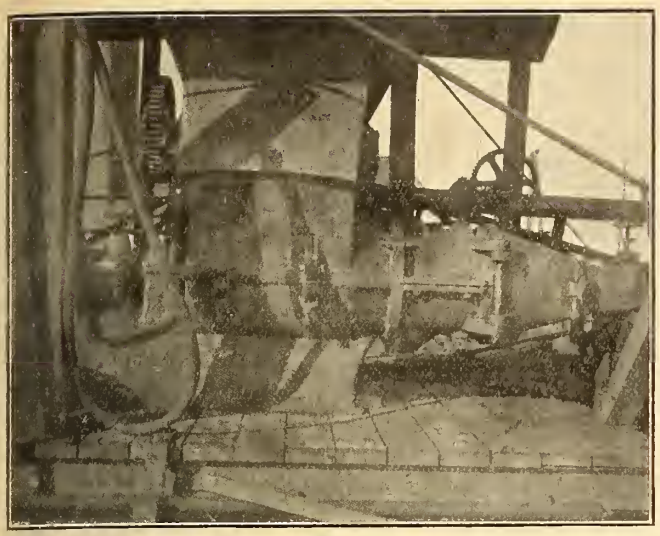
The plant is operated by:

1 Engineer.
1 Man who operates the excavator.
3 Men operating the cars.
1 Man attending the field press.
2 Men picking out roots and stumps (for which a winch is provided on the mill), and moving track ahead for the main mill.
2 Men moving track.

10 Men in all, in place of 13 men and 1 boy.

Wages at an average of $1.75 per day, equal, per day	$17.50
Estimate for oil and supplies, per day	1.00
Fuel, as before, labour collecting	2.00
Making the cost of putting on the ground of ½-day's work, i.e., 75 tons	$20.50
Or, per ton	.28

Machine Peat Stack.



Anrep Mill.

Small Peat Stacks.

Add for turning, and	.07
For piling	.10
Cost of fuel ready for storehouse exclusive of overhead charges	$0.45

Overhead charges in this case may be figured on a capital expenditure of:

Bog investment, drainage, and preparation	$ 4,000.00
Plant	12,000.00
Buildings, etc.	4,000.00
Working capital	5,000.00
Total investment	$25,000.00

Yearly charges to fuel output:

Depreciation, 5 per cent. of $20,000.00	$ 1,000.00
Interest on whole investment at 5 per cent.	1,250.00
Management and superintendence	1,800.00
Office, etc.	1,200.00
Repairs	500.00
Other expenses	750.00
Total	$ 6,500.00
Or, per ton on season's output	$0.45
Making cost on the field	0.90
Add to put in storehouse or on cars	.15
Cost in storehouse	$1.50

This is a conservative estimate of what may be done with this new machinery, and at this figure the manufacturer may safely figure on a net profit of $1.00 per ton on his output, a return that should be very satisfactory.

Until such time as there is a reserve supply of peat fuel on hand it will be difficult to get a commercial demonstration in this country of the production of power by producer gas, from peat fuel, excepting what may be done by the Department of Mines. Two plants installed in Sweden, and running continuously, are described by Mr. Nystrom in his report to the Government in 1908.

The question of the use of peat as a powder is also in its infancy. Small experiments have been made in Canada in burning cement and also in raising steam, with very promising results; but as the peat must first be dried to such water content as to be available for fuel, it would seem well to develop this part of the industry first.

The foregoing figures with regard to the Ottawa Government plant are made up from the writer's observations during a number of visits to Alfred. Some reference has also been made to one or two statements made by Dr. Haanel in his address before the Canadian Club in Toronto. The description of the new Anrep plant is from plans and information received direct from Mr. A. Anrep, Sr., Sweden. The operations, however, are so simple that the interested reader can verify almost every figure for himself with very little trouble.

There is no doubt that both Mr. Anrep's and Lieut. Ekelund's plants will be improved upon from time to time; but even with the machines at hand and with the information and demonstrations available, it seems safe to say that the uncertain element has been largely removed from the manufacture of peat into fuel. Beginning in 1911 it is hoped the peat fuel industry in Canada may turn over a new leaf and begin on a profitable page.

In conclusion, attention is drawn to two things: first, that processes by which the manufacture of peat fuel has been attempted, particularly in this country, have been so modified that no longer is a complicated and very expensive plant, involving many difficult operations, required; the simple problem of handling so much material so many times remains, an operation the cost of which may be fairly accurately and reliably estimated; and, second, that while the figures given herein are mainly estimates, they are based on actual work in 1910, much of which has come under the writer's personal observation. It is hoped that prejudice born of ignorance, or of the mistakes of some years ago may be to an extent dispelled, and this industry, than which there are few others more important, given a chance to get on its feet.

The United States production of coal during 1910 amounted to the vast total of 480,000,000 short tons, which almost equals the highest previous record in 1907.

From a Canadian point of view it is significant to note that the tide-water shipments from West Virginia have been materially enlarged. The strong position that this State is taking in the Atlantic seaboard trade affects Nova Scotian collieries. The contention that Nova Scotia can capture a considerable part of the New England market becomes weaker every year.

On the west coast, the production is still small, the State of Washington being credited with about 4,750,000 tons. California, Alaska, and Oregon, between them, produced only 100,000 tons. But California's oil is equivalent to a yearly output of nearly 20,000,000 tons of coal.

A GEOLOGICAL TRIP IN SCOTLAND

(By W. G. Miller.)

(Continued from Feb. 1st issue.)

Grenville and Keewatin.

The following quotations, taken from different pages of the Memoir, will bring out more clearly the resemblance of the sedimentary material in the Lewisian gneiss to the Grenville series of Canada. Moreover, it will be seen that the sedimentary material is associated with hornblende or chlorite schist, some of which may be altered basic lava. Associated with the hornblende schists are "quartz-magnetite granulites resembling the rocks of the Penokee iron-bearing series described by Irving and Van Hise." The hornblende schist, in so far as the writer knows, has not been proved to be intrusive into the crystalline limestone and associated sediments, but it is said that it "appears to have been injected along the margins" of the sedimentary bands. Since the hornblende schist is not known to be intrusive, one might be pardoned for hazarding the opinion that the relationship between at least some of the hornblende or chlorite schist on the one hand, and the crystalline limestone, iron-formation and other sedimentary material, on the other, is like that between the Keewatin and the iron formation and other sedimentary material in Ontario and the Lake Superior region in general. In any case it may be said that the Scottish rocks, in character and in their association, are strikingly like those of the last mentioned region.

"In Gairloch the chief belt of these altered sediments extends for seven or eight miles . . . . Its width is about a mile and a quarter, half of which is occupied by bands of hornblende-schist or hornblende chlorite schist. Consisting for the most part of a fine-grained brown mica-schist, it contains also various bands of limestone, graphite-schist and quartz-schist or quartz-magnetite-schist."

"There is no proof of the intrusion of the gneissose rocks of the Fundamental Complex into the supposed sediments, nor yet of the unconformability of the latter on the former. In certain places bands of marble and of kyanite-gneiss lie within gneisses of common type in the complex, and pass gradually into them."

"Great intrusions of igneous material, most of them now in the form of hornblende-schist, appear also to have been injected along the margins." And further: "Their (the hornblende schists) general uniformity of composition and texture and the rarity of inclusions in them which can be regarded as detached fragments of other rocks, or distorted amygdules, are hardly consistent with the supposition that they are altered contemporaneous lavas, but, on the other hand, they have nowhere been observed to transgress the sediments in any clear section. In general they are more finely foliated than most of the dykes either near them or elsewhere."

"On the southeast side of Shieldaig a band of micaceous schist, 120 yards broad at its greatest width, often calcareous and with outcrops of marble, emerges from beneath the Torridon rocks."

"It is interesting to compare the rocks of this and the preceding group (quartz-schists) with certain rocks found in the Penokee iron-bearing series. . . The rocks of this series include (1) cherty carbonates; (2) ferruginous slates and cherts; and (3) actinolitic and magnetitic slates. The quartz-hornblende rocks and the quartz-magnetite rocks from the Loch Maree area have decided affinities with the actinolitic and magnetitic slates of Van Hise. Both groups of rocks contain the same minerals and possess to a certain extent the same structures."

The altered sediments on the north-east side of Loch Maree "are associated with broad outcrops of hornblende-schist, and consist for the most part of mica-schist, graphite-schist and limestone, with bands which may represent altered quartzite and chert. The broadest development of these rocks stretches from Letterewe to Fasagh and may be called the Furnes belt. Its length from north-west to south-east is about five miles, and its greatest breadth, including various outcrops of hornblende-schist, nearly three-quarters of a mile."

"Near Kerrysdale chloritic schists occur on both sides of the more north-westerly of the two hornblende-schists. . . . . These schists merge into hornblende-schists. . . . small crystals of magnetite and calcareous spots and streaks appear more commonly in the chloritic than in the hornblendic schists. The chloritic schists usually effervesce freely with hydrochloric acid, even when no carbonate can be recognized macroscopically, and one of the calcareous streaks near Auchtercairn is a good limestone."

"A quartz-magnetite-schist, mixed with limestone and calcareous chlorite-schist, is seen in various places at the north-east side of the thick hornblende-schist which runs north-west from a point 300 yards south-west of the outlet of Loch Bad an Sgalaig in the Gairloch district. .

The quartz-schists in both districts may possibly represent altered schists, but the present resemblance of certain portions of them to cherts is perhaps rather the result of deformation. In some exposures north-east of Loch Maree more than 30 thin laminæ may be counted in the thickness of a quarter of an inch. Each of them was not improbably broader originally but has been dragged out and thinned."

It may be that some of the Canadian banded gneisses which have been called Laurentian are in reality older than the Keewatin. If this is the case, then these gneisses represent the surface over which the Keewatin rocks have flowed, and the crystalline limestones and other sediments have been deposited on the surface of the lavas or interbedded with them. If such be the case in Canada and the Lewisian gneiss is not intrusive into the crystalline limestones and schists of the Highlands, then the relationships and resemblance between the oldest rocks of Canada and the Highlands is similar.

On the other hand, if the Lewisian is intrusive into the crystalline limestones and associated schists, the relationship is exactly like, in so far as is known, that which the Laurentian granite and gneiss bears to the Keewatin and Grenville rocks of Canada.

Group (2) of the Lewisian.

Group (2), the igneous rocks intrusive into group (1), corresponds in a general way with certain post-Laurentian intrusive rocks of Canada, viz., certain granites and so forth which are pre-Keweenawan in age.

The Torridonian.

There is no means of definitely determining whether the Torridonian of Scotland corresponds to the Huronian or to the Keweenawan of Canada. It has been correlated with the Keweenawan by some writers on ac-

count of its reddish or brownish colour and degree of consolidation. But rocks that look alike, especially in the pre-Cambrian, are frequently quite different in age. Moreover, in the writer's opinion, much of the Keweenawan shows as great a degree of consolidation as does some of the Huronian. In fact, in certain localities, the Torridonian has a schistose structure.

"The great bulk of the formation consists of more or less coarse-grained arenaceous sediments in the form of felspathic grits and sandstones (arkose), with occasional thin intercalations of fine-grained micaceous shale and sandstone. Coarse angular breccia occurs as a local base, and numerous bands of pebbly grit, conglomerate, and scattered pebbles are found at different horizons, while the whole series is characterized by false bedding and other signs of current action." The prevalent features of the series are the uniformity of composition and fresh appearance, and the regularity and generally undisturbed character of their disposition.

"The base of the Torridonian series is usually formed of a conglomerate or breccia, sometimes exceedingly coarse in texture, and derived from the Lewisian rocks in the immediate vicinity."

"The pebbles that occur so abundantly throughout the arkose series afford, however, the strongest proof of the foreign origin of most of the Torridonian sediments . . . it may be sufficient to state here that they (the pebbles) include examples of sedimentary, metamorphic and igneous rocks which are not found within the Lewisian area, and suggest the existence of a pre-Torridonian sedimentary and eruptive series as the source of the coarser materials of the Torridonian formation."

While the writer does not think that the lithological resemblance of the Torridonian to the Keweenawan is sufficient evidence on which to base the correlation of the one with the other, there is other evidence to the effect that the two series should probably be correlated. (a) On a preceding page it has been shown that certain pebbles, quartzite and so forth, in the Torridon conglomerate, prove that a sedimentary series has been removed before the deposition of the Torridonian. This series that has been eroded may correspond to the Huronian of America. If so, then the Torridonian may be considered to correspond to the youngest of the pre-Cambrian sedimentary series of America, the Keweenawan. (b) The intrusive rocks of group (2) of the Lewisian do not cut the Torridonian. They bear a relationship to the latter like that which certain granites, and so forth, of America, which cut the Huronian, bear to the Keweenawan.

The following table will make clear the suggested relationships:

1. Canada—
. Keweenawan.
. Huronian with intrusives.
. Keewatin-Laurentian Complex (Laurentian granite and gneiss, Keewatin greenstones, etc., together with crystalline limestone, iron-formation, etc.)

2. North-West Highlands.
. Torridonian.
. Intrusives (of group (2) of Lewisian). A fragmental series consisting of quartzite, etc., has been removed by denudation prior to deposition of Torridonian.
. Lewisian, Fundamental Complex (gneiss, hornblende and chlorite-schists, crystalline limestone, iron-formation, etc.)

After the eruption of the dykes and sills of group (2) of the Lewisian, and long before the deposition of the Torridonian rocks, the whole region of northwest Scotland was subjected to terrestrial stresses which affected both the Fundamental Complex and the intrusive masses that penetrate it.

Glacial Origin of Conglomerate.

It is interesting to note that a glacial origin was suggested formerly for the Torridon conglomerate, as it has been suggested in late years for Huronian conglomerate of Ontario. "The mammilated contour so characteristic of the plateau of Lewisian gneiss was attributed by Sir A. Geikie in 1880 to the action of landice, and he compared the overlying breccia of Torridon sandstone age, that fills up the hollows and buries the rounded domes of rock near Gairlock, to moraine stuff." In the final memoir by the Geological Survey on the Northwest Highlands, 1907, the theory of the glacial origin of the Torridon conglomerate is dropped. "The basal breccias which often flank the buried mountains (Lewisian below Torridonian), are, as already explained, of the nature of scree material. They consist of fragments of the local rocks embedded in a sandstone matrix. The conglomerates, on the other hand, are probably torrential deposits brought down from a district very different in geological structure from that of the area in which Lewisian gneiss occurs."

The fragments of rock in the Torridon conglomerate and breccia have frequently come from a considerable distance. "In one instance, on the north side of Loch Maree, it has been observed that blocks in the conglomerate have come from the hornblende-schist ridge of Ben Lair, and may have travelled a distance of three miles."

Absence of Ore Deposits in Highlands.

Considering the importance of the ore deposits in the pre-Cambrian of the Lakes Huron-Superior region, the absence of valuable deposits in the Highlands at first seems remarkable. If we bring to mind, however, the difference between the pre-Cambrian of the two regions, the non-economic importance of the Highland rocks is not so much to be wondered at. The Keewatin series is not known to occur in the Highlands, and, if it does, the outcrops are comparatively insignificant. In this series in America are found the Vermilion and other important iron ranges. The Animikie or Upper Huronian is likewise absent in Scotland, while in the Lake Superior region the great Mesabi iron deposits occur in it. Moreover, if there are rocks in Scotland similar to the quartz-diabase of Cobalt or the norite of Sudbury, which have been the ore bearers in these two important mineral areas, they are of small volume. The copper deposits of Michigan are found in the Keweenawan but the Torridonian has not been rendered of similar economic importance by basic igneous rocks.

Cambrian and Eastern Schists.

Little need be said concerning the Cambrian except that it rests unconformably on the Torridonian and its lower beds represent the *Olenellus* zone. One of the most puzzling points that the early workers in the field had to deal with was the relation of the Cambrian to what are known as the Eastern or Moine Schists, the fourth great group of the Highlands. Later work has shown that the superposition of the highly metamorphosed rocks on the Cambrian has been brought about, as has been said on a preceding page, by thrust.

The character of the Eastern Schists and the knowledge possessed of their age relationships will be understood from the following: "Only a brief reference need be made here to the Eastern Schists that appear to the east of the Moine Thrust-plane. Excluding the belt of mylonized rocks (ground-up rocks), usually found in association with that displacement, this group comprises flaggy, quartzose schists with muscovite, quartz-biotite, granulites, and garnetiferous muscovite-biotite-schists, which together evidently represent an altered sediment-

ary series . . . . These rocks have been the subject of much discussion. They were once regarded as portions of the oldest or Azoic architecture of the country. Murchison considered them to be a metamorphic series of mainly sedimentary formations, later in date than the Lower Silurian (Cambrian) limestones and quartz-rocks which underlie them, and into which they seemed to pass downward in a conformable succession. The detailed study of them by the Geological Survey has thrown considerable light on their composition and structure, but the problem of their age and origin has not yet been completely solved. . . . When the rest of the Highlands lying to the east of that belt has been surveyed, it may be possible to offer some more definite opinion as to the stratigraphical relations and history of these rocks."

While rocks of diverse age and origin are included under the name Moine Schists, "which together evidently represent an altered sedimentary series," a person familiar with the pre-Cambrian of Canada will be inclined to ask himself whether much of this altered sedimentary series does not represent a group of rocks that, in age, lies between the Lewisian and the Torridonian. If this is the age relation of some of the schists, they occupy a place in the geological column similar to that of the Huronian of Canada, which lies between the older Laurentian-Keewatin complex and the younger Keweenawan. In the description, given above, of the Torridonian, it was said that the pebbles of quartzite and other rocks, "derived from formations that are not now visible anywhere in the western part of the counties of Sutherland and Ross," are found in the conglomerates of the series, showing that an older sedimentary series has been removed before the deposition of the Torridonian. Similarly in Canada it is found in some localities that the Huronian has been removed before the deposition of the Keweenawan on the Laurentian-Keewatin complex.

The relationship that has been observed to exist, in two or three localities, between the Lewisian and the Eastern Schists, will be seen from the following: "More recent work, however, between Stromeferry and Loch Alsh has led Dr. Peach to the belief that the Moine-Schists in that district rest unconformably on gneisses of Lewisian type. He has found what he regards as a conglomerate locally developed at the base of the Moine-Schists and overlain by a definite order of succession among the schists analogous to that in the Diabaig group of the Torridon sandstone. . . . It would thus appear that at least some of these rocks existed as crystalline schists before they had reached their present position." Schists in one locality in Skye possess characteristics from which it might be inferred that they represent a sedimentary series older than the Torridonian. "These schists represent what were originally false-bedded grits and sandy and gritty shales."

General Notes.

In addition to their highly interesting stratigraphy and structure the Northwest Highlands have a charm for the traveller or tourist. At times the region has very changeable weather with much rain, but during the ten days of my visit the conditions were ideal. To me the region was something new and entrancing. The high, ordinarily rounded hills or mountains, practically bare of trees, have a somewhat strange appearance to one from the wooded regions of Canada. Were it not that the surface is clothed with grass and heather, one would be inclined to compare it in a general way with the arid or semi-arid parts of the southwestern United States. The moist climate of the Highlands, however, is conducive to a rich growth of grass. Peat is found well up the hillsides and not merely in low swampy areas as with us. The supply of it seems to be inexhaustible. It has served as a fuel supply for countless generations and is still being used by the dwindling population. Much of the surface of the Highlands seems to have been well wooded in past ages, judging from the remains of trees found in peat deposits. The timber has been destroyed and its growth has not been encouraged in later times. Small plantations here and there in the valleys show that timber trees will grow well in this climate. Probably if afforestation were taken up in earnest, by first setting out trees in the valleys and gradually working the growth up the hillsides, the greater part of the surface could be turned into a forest region. To the writer it seemed that afforestation is the most important economic subject that can be dealt with in the region. The small areas of arable land that in past generations, when people's wants and desires were more simple, supported isolated groups of families, cannot under modern conditions retain the population. Many of even the more productive localities have now less than half of the number of people that they formerly supported.

One cannot but feel that a spirit of melancholy pervades the Highlands, due to the fact that the population is decreasing. The young people are emigrating in large numbers, leaving the old.

Comparatively little attempt has been made at afforestation. Most of the surface is devoted to deer "forests" and a tree-covered surface is not considered good stalking ground. The term forest as applied to these areas is a misnomer. There is often scarcely a tree in a square mile of "forest." Rentals for hunting rights are probably as great or greater than they would be if the surface were devoted to any other purpose.

It would seem that the Highlands will soon be monopolized as a field for tourists and holiday seekers. The Macs, and all people with clannish cognomens, are going to the Highlands in increasing numbers each year. Many of them are three generations or more removed from Scottish soil, but they all wish to see something of their ancestral abodes. The Macs, especially the American girls and their "mas," from the four quarters of the globe, are to be found in great numbers looking up the seats of their clans. The sellers of tartans are kept busy.

The ease and speed of travel across the ocean now-a-days has done much to make a kindlier feeling towards Britain than existed in parts of North America, at least, fifty or even twenty-five years ago. "Tail-twisting," which was a common spectacle in the United States during election campaigns not many years ago, owes its decadence as much to summer travel as to any other cause. The English speaking people are getting closer and closer together, and in the years to come one of Britain's chief industries will be catering to the visitors from among the two hundred million or more overseas Anglo-Saxons.

In one of its issues last summer a London newspaper had an item to the effect that a reporter on its staff took a stroll up the Strand in the morning and saw only one Englishman. There were crowds of Americans. This is an exaggeration, but it shows the impression that summer visitors make even on the population of London.

Travelling in the Highlands is now pleasant and easy compared with what it was a few years ago. The automobile has done wonders. Motor stages run on many of the main roads. The little hotels scattered here and there, especially where holiday fishermen congregate are good.

Since the Lloyd George taxes were imposed the national beverage is not taken on faith. It is claimed that

there is now a tendency to substitute inferior brands or dilutions for the genuine old time stuff. It is a common sight to see a man first sniff his glass to get the "bouquet," then take a sip before venturing on a swallow. Although this paper is intended to deal with solids rather than with liquids, since we have mentioned the latter we may add that many of the clubs in Britain have not increased their prices but they have substituted a "pony" for the former larger volume. Thus does the budget restrain the bibulous!

The Companies Act and Suggested Amendments

(Written for the CANADIAN MINING JOURNAL by JAMES E. DAY.)*

My remarks at a recent luncheon of the Toronto Branch of the Canadian Mining Institute, as to the danger of unskilled amendments to the Companies Acts led the Editor of the CANADIAN MINING JOURNAL to ask for an article thereon, and also on the unwisdom of so many of the proposed amendments makes a discussion from the point of view of the lawyer not untimely. The mining man devotes his life to increasing the nation's wealth and resources, and to bringing to light the hidden treasures nature has for those who have persistence and skill to discover them, and knowledge and experience enough to make the development not a gamble but a manufacturing and commercial proposition. When he finds, however, that investors and bankers look on mining as gambling pure and simple, he naturally calls for some means to be taken to remove from the mining industry the bad name imposed by those who with worthless stock mine the public instead of the ground. With all deference, however, to the good intentions of the reformers it is well to point out that remedies should be carefully thought out before being administered. Had there never been any mining companies, and had all the money that has gone into mining experiments in Ontario been raised by private partnerships, there would be now an equally loud clamour for the Government to protect the public against their errors of judgment, in sinking their shafts in the wrong locations. In Cobalt, inspection of properties was to be the panacea that would prevent money being lost; instead, inspection merely proved another bait for the hook the unscrupulous promoter dangled before the suckers.

This much is plain—that some disreputable promoters, and many more unwise ones have hurt the mining industry, but it has not been all an unmixed evil. The public learns much by experience, and is also learning the need of sufficient money in the treasury, the unfairness of over issue of stock to promoters, the necessity of business management, and the distinction between promoters' stock and treasury stock. A little examination of the various suggestions made by way of amendments to the Companies Act shows us two things: First, that in our present craze for the law to do everything we are forgetting the prime importance of leaving grown men free to make their own bargains; and, second, that those most free with suggestions of improvement have not always taken the trouble to know what the law is which they seek to amend, or to study out the effect of their amendments.

A bill aimed to prevent over capitalization is now being introduced in the Ontario House by Mr. Johnston. The intent is good; the real effect would be awful. It provides that companies dealing in commodities that will be offered to the public (and what commodity is not?) may issue stock only for cash and at par. The law at present is, that only mining companies can issue stock at less than par. Why the need of this change? And if stock can be issued only for cash, then the merchant who converts his business into a company must somehow get the cash and can not take stock.

It has been suggested that the number of shares of all mining companies be fixed at the same number, limited, for example, to 100,000 or 1,000,000 shares, having no fixed value except what the company chooses to impose and the public is willing from time to time to pay. This has many merits. A buyer knows that he has an aliquot part of a mine, say, for example, seventy one-hundred-thousandths, instead of having a certificate of 700 shares of a value of one dollar each in a company, which shares on their face purport to be worth $1.00 each, but may, in fact, be worth not ten cents each. But what would happen to such a company if its shares were all issued and further money were needed? There would be no new shares to be issued, no more could be created, and concerns that would be in absolute need of money for further development would either have to issue bonds, which is not always possible and is seldom desirable, or go out of business. Money for further development would be raised by subsidiary power companies, milling companies, transportation companies, selling companies, each absorbing its share, and a little more, of the profits legitimately belonging to the company, and each a fertile source of graft.

The company's directors would of necessity have to fix the value at which its shares would be sold. The shares of a Nipissing would be worth more than of a Little Nipissing. Once that is allowed, every clever promoter would see that in the beginning the shares were put low enough for him to be able to get most of them without being open to any charge of over valuing the property. And, while the legitimate company would be hampered, the promoter seeking a cheap stock would simply pool a controlling number of shares and issue trust certificates against them at seven cents per share.

If a mining company can not sell its stock at less than par, then a company that had started with good prospects and had sold some stock, yet found its values depleted, might as well go out of business and let its shareholders lose their investments, for, while a man would buy shares at par at the start of a promising proposition, he could not fairly be expected to do so later on when its condition had turned out to be not as good as expected. The experience of the Mixado mine in the Rainy River district, which, after being shut down for years is now being re-opened, shows what it is possible to do if the men who are now willing to risk some money have not to be asked to put up as much as those who bought stock in its first flush of prosperity. Experience shows also that, in order to get the first investors (in Canada, at least), to take the chance there always must be in any mine, at least until after much development, he must have not only a prospect of dividends but also a chance of increase of stock value which can only be got by getting stock cheaper than it can be expected to sell after the mine is producing steadily.

It has been suggested that a fixed percentage of the total capital must be subscribed before the stock be

*Barrister, etc., Day, Ferguson & O'Sullivan, Toronto, Ont.

issued to the public. But that is the law to-day. To avoid the certain disaster awaiting the company, which, though it might be prosperous with sufficient capital, must be a failure if it starts out with insufficient funds, the law stipulates that a prospectus must be filed stating what amount of stock must be subscribed before the subscriptions to its capital stock are binding. If the public has not learned this what hope of their learning still more laws? How can a man be protected who will not protect himself? One can hardly imagine an English investor signing an application for stock without seeing what is the minimum subscription on which the company will go to allotment. All the investor has to do it to inquire for himself. He would not buy other things without some inquiry, and if he does not know that capital is needed in a company—as in an unincorporated business—making a new law will not help him. But even this beneficial law shows how difficult it is to frame a law that will meet every case. While the law calls for the prospectus, the investor does not. If he does, he finds often, either that the company has issued all its stock as is the custom in the United States and is raising money from the proceeds of stock held by a trustee for it, or that the prospectus stipulates that on application for and allotment of, one share all future subscriptions are binding.

This last is legal, and in some cases is wise. How can it be prevented unless the Government undertakes to devise some machinery to investigate each case, and tell each company how much stock it must sell? Such a condition would be intolerable, would be certain to be abused. The company would at first proceed with some proposition calling only for a small capital, and, having gone to allotment, would take up the large scheme with perhaps insufficient funds. Any attempt to prevent this by providing for fixing a new minimum allotment on the making of each new contract would mean that the Government would have to supervise every contract made by every company that may at any time want to sell any stock, and would lead to an intolerable and unjustifiable handing over of the reputation of private business to the Governmental department in the hope of doing what has never been and never will successfully be done, namely, preventing men from making foolish bargains.

Unwise and unconsidered legislation will mean an unworkable law, will mean that companies instead of coming under Government control will be altogether beyond it. For, while the operating companies might remain Ontario companies, the stock of these companies would be held by means of pools or arrangements or other forms varying from time to time, by American companies. You can not prevent a man buying stock in an American company, nor the owner of a mining prospect from selling his interest to an American company, either directly or by means of selling to the American company—or to a trustee—the stock he has got from an Ontario company. Nor can a sane and satisfactory law be devised to prevent an individual selling his own shares in a company on any terms that he chooses, so long as he commits no fraud. Hasty and ill-considered legislation will only lead to consequences never thought of by its proposers.

Yet the facts remain that conditions are not what they should be and that the Government, which gives to corporations their existence, has a right to regulate them so long as the regulations do not defeat their object. It is for the mining, commercial and legal fraternity to help by education and by suggestions. If we once definitely locate the weak points and defects in the system it will be possible to better it, though never to attain perfection. We need more common sense and less law making, more publishing and advertising of changes in the law, more investigating into what the law really is, more backbone in refusing to buy stock in the concerns that in one guise or another have their stock put out without telling the public what is the price paid for the property, what amount is required for its operation, and what guarantee there is that this money will be raised. And when a panacea is proposed that is to remedy all the wrongs we might first investigate to see whether older countries, which have had the same experiences as we, have tried this remedy and if not why not. Away back a century and a half ago Blackstone said, "What kind of an interpretation can he be enabled to give who is a stranger to text on which he comments! It is perfectly amazing that there should be no other state of life, no other occupation, art, or science in which some method of instruction is not looked upon as requisite except only the science of legislation, the noblest and most difficult of any."

MINE ACCOUNTS AND COST SHEETS

(From the Bulletin of the Institution of Mining and Metallurgy.)

The dissimilarity of conditions in mines renders uniformity in accounts impracticable; nevertheless the committee have arrived at the conclusion that as regards the allocation and grouping of expenditure certain general principles may be laid down. The following principles are therefore put forward as of general applicability, and it is recommended that they be adhered to, so far as circumstances may permit. If the procedure recommended in this Report be adopted, in addition to securing many other advantages, it would facilitate a comparison of costs at different mines.

Capital Account.

Before the producing stage is reached, all expenditure should be charged to Capital Account and may be grouped under the following heads: (1) Property; (2) Main Shafts or Main Adits; (3) Machinery and Plant; (4) Buildings; (5) Surface Works (Reservoirs, Water Service, Railway Sidings, Roads, etc); (6) Underground Development.

Main shafts or adits to reach orebodies should be charged direct to capital. Incline shafts which develop ore, subsidiary shafts, winzes or other workings which have assisted development of ore during progress, should be charged to "Underground Development," which either may be subsequently treated as a Temporary "Development" Account, or may remain a Capital charge.

All other expenditure should be carried to a "General Expenditure Account," to be distributed proportionately, as soon as possible after the mine enters the producing stage, over the remaining heads of expendi-

ure, after deducting any revenue which may have been eceived.

After the producing stage is reached, no expenditure hould be charged to Capital Account except large spe- ial items, such as (1) Purchase of additional property; 2) Sinking of new main shafts to reach orebodies; 3) Erection of additional buildings, machinery, plant, r surface works which may be necessary either to in- rease output, to improve recovery, or to decrease costs. Such items of capital expenditure should bear their roportion of the administration and general charges. f any existing shafts, machinery, plant or buildings hould be entirely superseded and replaced, the cost of he old items should be written off Capital to Profit and Loss, either at once (if small) or in the case of large tems, by instalments spread over as short a period as he responsible engineer may recommend. All repairs, naintenance, and replaeements of minor machinery and lant should be charged to Working Costs.

In the interest of shareholders, the Committee desire o express their strong disapproval of the practice, vhich is sometimes resorted to, of charging to Capital, tems of expenditure that should properly be included n Working Costs, thus exhibiting a fictitious statement f profit.

Profit and Loss Account, Etc.

Development.—After the producing stage is reached, ll deepening of main shafts after they have reached the re-body, sinking of interior shafts, as well as all driv- ng, cross-cutting, raising, winze-sinking and plat-cut- ing, should be charged to Development Aceount, which nay be treated as a main head of Working Costs, or he whole of the development before and after reaching he produeing stage may be treated as a Temporary Ac- ount. In the latter case the Working Account should e debited with an average rate of Development Re- demption slightly in excess of the average cost at which he payable ore-reserves have been developed, reckoned n a milling basis; with the object of gradually ex- inguishing the Temporary Account, or of providing unds for securing a gradual and automatic increase n the ore-reserves. After such temporary account is xtinguished all development should be charged direct o Working Costs.

Temporary or Distribution Accounts.—With the bjeet of distributing costs as evenly as possible, it may e desirable to open other temporary accounts in order o spread the cost of considerable items of machinery r plant replacement, or payments which recur annu- lly or at somewhat long intervals, over the monthly osts; the multiplication of such accounts is, however, ndesirable, and they should be rigorously extinguished.

Valuations for Balance Sheet and Profit and Loss Account.—Bullion, concentrates or other marketable products ready for shipment should be shown as assets n the Balance Sheet and credited to Revenue Account t net valuation after deducting all possible reduction harges. Unfinished products when taken into account hould be reckoned only at cost, provided such cost does ot exceed market value.

Depreciation may be considered as it affects the prin- ipal heads of Capital expenditure, viz.:—(1) Property; (2) Main Shafts or Adits; (3) Machinery, Plant, Build- ngs and Surface Works.

As regards property, systematic depreciation is theor- tieally correct, and especially so in the case of mines with ore-bodies of limited and definitely determinable xtent, but is seldom or never carried out. In such ases, however, special reserve funds may be accumu- lated out of revenue with the full knowledge and assent of the shareholders.

In the case of some mines, the probability that exist- ing main shafts will sooner or later require to be super- seded by new ones is so great, that it becomes desirable to write down gradually and systematically the cost of existing main shafts, or to accumulate otherwise an equivalent cash reserve sufficient to cover the cost of a new shaft when required.

As regards machinery, plant, buildings and surface plant, it is clear that although maintained out of Reve- nue in perfect repair and efficiency all such items are liable to become obsolete and have to be superseded. The Committee are therefore of opinion that suitable financial provision should be made gradually out of revenue in the case of every mine for new machinery and plant, buildings and surface works, all of which will probably be needed before the mine is worked out.

Such provision is generally made, (often, however, to an insufficient extent), by means of depreciation charged annually or semi-annually to Profit and Loss Account on the original cost of the plant, buildings, etc., the amount written off being fixed accordingly to a conser- vatively estimated "life" of eaeh item. This method not only accumulates a fund for new plant, but also gradually reduees the assets shown in the Balance Sheet to something more nearly approaching their real value.

Another method which attains the desired end of mak- ing provision for contingencies in an equally effective way, without depreciation, is to include regularly in Working Costs an allowance of a certain sum per month, or per ton, under a separate main heading of "Provision for Additions to Machinery and Plant," or to appropriate each year a certain porportion of the profit to a special reserve fund.

This method simplifies accounts, and, where ample cash reserves are kept in hand, it seems to work well in the case of ore deposits with a determinable life which is ascertained from year to year.

The method of depreciation, however, appears to be generally considered preferable; but care should be taken that the percentage written off is based on the original cost, and not on a balance standing in the books at any subsequent date.

The above recommendations should be carried out as soon as there is an available balance at the credit of Profit and Loss.

Working Accounts and Cost Sheets.

The Committee recommend that for the sake of con- venient comparison, both in working accounts and cost sheets, all expenditure should be classified under the following main heads, viz.:—

1. Development.
2. Extraction of ore (i.e. mining).
3. Sorting at surface, preliminary crushing and trans- port.
4. Reduction costs (i.e. ore treatment).
5. Administration charges and general charges at mine.
6. Realization charges on products.
7. Taxes and royalties of all kinds, shown separately.
8. Head office charges.

The total Capital Expenditure should also be shown on all General Expenditure Sheets.

The sub-division of these main heads into sub-heads must necessarily depend somewhat upon the conditions, but the advantages of adhering as closely as possible to one form, and departing from it only where necessary,

are manifest. The following may be suggested as desirable sub-divisions:—

1. Development Costs need only appear in the general cost sheet in one total, but a detailed sheet should be prepared showing the total expenditure and cost per foot in shaft-sinking, driving, cross-cutting, raising, winzing, and plat (or station) cutting separately, as well as the proportions of these expenditures which are for labour and for materials respectively.

2. Extraction of Ore may be usefully divided into:—
   (a) Stoping or breaking of ore, including under sub-heads: compressed air and rock-drill costs, labour and supplies, shovelling, etc.
   (b) Timbering, filling excavations and sorting of ore in stopes (if any).
   (c) Hoisting.
   (d) Pumping.

Note.—Where the cost of pumping is exceptionally heavy, it may be convenient to make this item a main head. The same remark applies to the removal of overburden when a deposit requires to be stripped.

   (e) Underground tramming.
   (f) Sampling, assaying and surveying.
   (g) General underground maintenance.

It is suggested that these sub-divisions of the main head, Mining or Extraction of Ore, should be set out in detail in the general cost sheet, because mining is at once the principal item of working cost and offers the greatest scope for economies.

4. Reduction Costs must be sub-divided according to the treatment undergone by the ore, as, e.g., crushing, amalgamation, concentration, fine grinding, cyaniding sands, slimes treatment, roasting, smelting, converting, leaching, precipitation, etc.; for each of which a detail sheet should be prepared in such form as circumstances may dictate.

5. Administration may be divided into salaries (general resident manager and clerical staff on the spot), stationery and office general expenses, travelling expenses, insurance and legal expenses, accidents, medical, sanitary and hospital expenses, stabling and sundry transport, etc.

8. Head Office Charges, besides ordinary central office expenses, will include a great variety of items such as agency expenses, directors', consulting engineers' and auditors' fees, bank charges, etc., also interest on debentures (if any).

Note.—The individual items under (5) and (8) are liable at times to merge one into the other.

The Committee recommend that all statements as to the quantities and values of stores, ores and products on hand should be certified by the responsible officials, countersigned by the manager of the mine. An independent audit of stores, etc., is advisable from time to time.

The Committee append to this Report a supplementary memorandum amplifying their conclusions and explaining the grounds upon which these conclusions have been based.

(Sgd.) A. G. CHARLETON,
Chairman of Sectional Committee "E"—
Mine Accounts and Cost Sheets.

STANDARDIZATION.

Memorandum accompanying the Report of the Mine Accounts and Cost Sheets Committee.

The Sectional Committee have carefully considered the views elicited in reply to the circular issued by the Council on April 30th, 1908.

As a result they have come to the conclusion, after thoroughly considering the various aspects of the subject, that uniformity in all the details of Mine Accounts and Cost Sheets, so as to co-ordinate them on precisely the same lines in different districts, is impossible of attainment in practice. This is due to the fact that mines are frequently operated under entirely different conditions, and have, besides, to deal with dissimilar metals, sometimes alone, but frequently in association, necessitating different metallurgical treatment, which naturally involves keeping accounts and cost sheets adapted to meet special requirements of this kind, on somewhat different lines; hence it follows that methods that are applicable in some cases do not always suit others equally well.

They think, however, that a great deal might be done in the direction of standardizing mine accounts and forms by local committees or associations representing groups of mines on each field.

General Principles.

It must be recollected that mine accounts have to fill several different primary functions, and are not merely confined to one object; for instance, whilst serving as records for guidance in the distribution of expenditure and the collection of revenue, they must also show the profit and loss, or the financial condition of the undertaking; but this does not exhaust their aims, as they should be properly designed to supply the management with the statistical data necessary to check the efficiency of the administration, and to point out the direction in which useless expenses may be cut down, or revenue may be increased.

It should also be remembered that the presentation of Working Costs is of little service, unless given in a form that is useful for comparative purposes, and, if due care is not exercised in their preparation, "Cost Sheets" may in some cases be worse than useless, through being absolutely misleading. In fact, as a prominent mining engineer has well stated the case:—"The wide variations in physical and economic environment are so likely to vitiate conclusions from comparison of statistics from two mines, or from two detailed works on the same mine, or even from two different months on the same work, that the greatest care and discrimination are demanded in their application."

The Committee feel, however, that a recognized broad common basis of arrangement, and agreement of details in presenting accounts and cost sheets furnished by mines in different parts of the world, would be of great benefit to the mining profession, as well as to the public who are concerned in the advancement of the mining industry.

There are certain bounds, of course, beyond which segregation and division of working-costs and accounts cannot be carried with advantage in any case, and the value of working costs largely depends, (1) upon their being spread over a considerable length of time, so as to represent true average rates of expenditure; and (2) upon the interest and care taken by managers and heads of departments in securing as far as possible accurate data upon which to base such calculations. It is also of great importance that all items which recur regularly should appear in working costs and always under the same headings, and (3) that all items not clearly chargeable to Capital Account should be included in working costs.

(Continued Next Issue.)

TERRY SHOT DRILLS

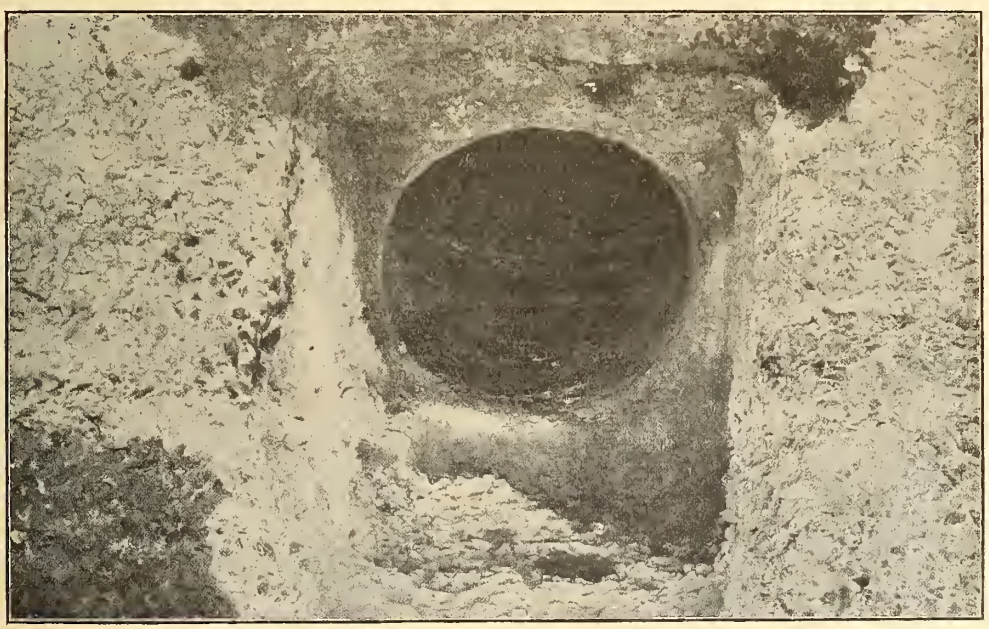
(By P. H. Moore, Consulting Engineer for the McKiernan-Terry Drill Company.)

It has been our experience in the core drill business o find but comparatively few mining, railroad, and ci- il engineers, contractors, and quarry men who realize he practical and numerous ways a core drill of the shot ariety can be used.

In mining exploratory work you can drill a hole to ractically any depth, and, depending on the size of machine used, can take out any size core from one inch to three feet. A hole can be put down at any angle less than 45 deg. from the vertical, and even a flatter angle can be bored providing the speed of the bit is sufficient so that the centrifugal force will keep the shot evenly distributed around the cutting edge. You can put a hole down through hard rock at a speed of twenty inches per hour and much faster in favourable formations. As the machines are entirely portable and self contained it is almost as quick to put down a dozen 100-foot holes as it is to put down one 1,200-foot hole.

Climatic conditions do not seriously hinder core-drill work when the drill is properly rigged. The ease, economy, and speed, with which a mining property can be thoroughly tested is surprising to the every-day miner. The core drill is particularly valuable to the tentative investor in mining properties, who may have obtained a short option on a promising property, but who would like to make sure of just what he is getting before making the final and heavier payments. Sixty and ninety days is long enough to prove up any pro-

Cores from a 29 inch bore hole. Note water-pipe and eye beam cut clean through.



A 29 inch bore hole drilled in the side of a trap rock concrete embankment.

perty if a prospective purchaser would put the proper number of core drills to work, depending, of course, upon the area to be tested, and get a perfect sample of the underlying formation.

The advantage of large cores in mining, say up to 20 or 30 inches, is that the cost of drilling the hole is but little more than a two or three-inch hole, and the core obtained gives a better horizontal sample of the formation.

Then in case the core from some particular hole is sufficiently interesting and the operators deem it wiser to put a working shaft at that point, the core hole of say 20 or 30 inches serves as a sump and a cut to blast to in sinking the shaft. The work thus carried on is in the nature of underhand stoping (always breaking the rock to the large core hole) instead of being obliged to take out sinks and cuts before breaking the bottom of the shaft out to its full size. The large core hole also acts as a sump, and no water can impede the progress of sinking.

For the bare purpose of proving up a prospect where the speed is essential, the Terry Class A drill is big enough, taking out a 1 3-4 inch core to depth of 500 feet. In coal mining the large cores are particularly advantageous as the cores do not break up so badly in friable rock and a more perfect sample is obtained.

The large core holes are also the cheapest way to ventilate a mine. At the Stella mine in Herman, N.Y., numerous 20-inch holes were bored with a Terry drill in place of winzes and raises. It was the experience at this mine also that using a small shot drill, a larger per cent. of perfect core was obtained with the shot drills than with the diamond drills—the shot drill cores being 1¾ inches in diameter, and the diamond drill core being 7-8 inch.

For railroad engineers the shot core drills are particularly useful in testing river and lake bottoms, or in seeking solid formation for piers and bridges, also to prospect for iron, coal, etc., on the railroad lands, or in prospecting to determine the mineral possibilities of different sections of any country through which it might pay to build a line.

The shot-drill is of the utmost benefit to the civil engineer in testing formations for foundations for heavy buildings. Many costly mistakes can be avoided by a perfect knowledge of the underlying formation upon which a building is going to rest.

Contractors and builders use the shot-drills in many ways—boring holes for blasting heavy rock, for elevator plungers, for artesian wells, for oil and gas. The quarry man can use this shot drill for boring deep holes for blasting, for testing the depth of their marketable formation, and last but not least it is perfectly feasable to use a large drill and take out marble or granite columns up to 36 inches in diameter, or even larger, in one solid piece and as long as the natural fractures in the formation will allow, providing the grain of the rock runs the right way.

Advantages Over Diamond Drills.

We perhaps owe more to the diamond drills (and to the intelligent class of men that have operated them) than to any other agents for the disclosure of the mineral wealth of the world. But the shot drill has several advantages over its honoured and rightly respected rival, namely:—

(1) Cost.—The whole shot drill outfit costing barely as much as a single diamond bit. Hence less installation cost. The cost for shot and the wear on bits per foot is about half the cost for wear on diamond.

(2) Speed.—The shot drill cuts a two-inch core at about the same speed as a diamond bit cuts a ⅞-inch core.

(3) Results.—The shot drill gives a larger per cent. of perfect core, of larger size, at less cost, at same speed.

A Class D Terry Drill was lately purchased by the United States Government, for drilling 30-inch holes in a diabase conerete embankment reinforced with steel I beams and drain pipes. The illustration shows how the shot bit bored cleanly through this peculiar formation

Part of 80 tons of Granite and Quartz taken from a 10-inch Bore Hole 2,000 feet deep by a Terry Class C. Drill. Some of the Cores are in solid pieces 18 feet long.

leaving the steel beams and pipe imbedded in the core.

In summing up the many practical ways a core drill can be used to great advantage, I would call attention to the fact that after their invaluable services to the prospector, their greatest value should be to the coal miner—in rescue work. A few 30-inch holes put down in strategic positions from the surface into the lower workings of coal mines, and equipped with ladders, would give ready egress and good ventilation at all times.

Reciprocity in Zinc and Lead Ores and Products.

The thirteenth annual convention of the Associated Boards of Trade of Eastern British Columbia was held at Creston, B.C., in January. It was attended by delegates from the respective Boards of Trade of the following towns: Nelson, Trail, Rossland, Kaslo, Creston, Moyie, and Fort Steele. Among many subjects affecting the commercial and industrial interests of the Kootenay district discussed was that of reciprocity between Canada and the United States in zinc ores and zinc in all its forms, the latter including zinc manufactures.

A resolution of the Kaslo Board of Trade, submitted by the delegates from that Board, H. Giegerich and J. W. Cockle, and adopted by the convention, was as follows:

"Resolved, That the Associated Boards of Trade hereby approve and endorse a certain memorial, a copy of which is attached and made a part of this resolution, dated November 28th, 1910, addressed by J. L. Retallack, on behalf of a majority of actual and potential producers of zinc ore in this province to the Hon. the Minister of Finance, Ottawa, requesting that 'in case of negotiations toward a measure of reciprocal trade between Canada and the United States being entered into in the near future, an attempt should be made to secure the free interchange of zinc ore and zinc in all its forms.'"

MEMORIAL TO MINISTER OF FINANCE.

The memorial thus endorsed was as follows:

"The Hon. W. S. Fielding, Minister of Finance, Ottawa:

"Sir,—After consultation with the majority of present and potential producers of zinc ore from these districts, I beg to respectfully submit that in case of negotiations toward a measure of reciprocal trade between Canada and the United States being entered into in the near future, an attempt should be made to secure the free interchange of zinc ore and zinc in all its forms.

"According to recent announcements, it would appear that the principle upon which the United States tariff has been to some extent framed in recent years, and upon which it will be framed, is the protection of American industries to an extent equal to the difference between the cost of American labour in the exporting countries, whose products compete.

"Under the Dingley tariff, zinc ore was admitted free into the United States, and, on the authority of the 'Mineral Industry,' the total imports of such ores from all sources were for the years hereunder stated as follows:

	1906. Tons.	1907. Tons.	1908. Tons.
Mexico	88,900	108,800	68,383
British Columbia	600	1,157	6,157

.."This in comparison with the domestic production in the United States of: .

1906	905,175	tons.
1907	902,923	tons.
1908	838,277	tons.

"At the hearing of the Ways and Means Committee at Washington in 1908, which resulted in the Payne-Aldrich tariff of 1909, considerable attention was given to zinc. Representatives of the producers of such ore from the mining districts of the west laid much stress upon the low wages paid in Mexico, stating that the peon miner received only 37½ to 50 cents per day (United States currency), whereas the United States miner was paid six or seven times that amount. Not a word, however, was said about low wages in British Columbia, for the sufficient reason, no doubt, that miners' wages here are generally higher than in the productive districts of the United States. They are certainly higher than in New Jersey or the Joplin district of Missouri, which jointly account for more than two-thirds of the production of zinc ore in the United States, or in Oklahoma, and are as high as Wisconsin, Colorado, Montana, Idaho, or any other productive state.

"It would appear, therefore, that the whole argument for the present high zinc duties in the United States was based upon the low wages in Mexico, and that the representations of the United States producers to the Ways and Means Committee in 1908 were that they could not compete with Mexico on even terms. Accordingly, the Payne-Aldrich tariff imposed a duty on zinc-bearing ore carrying 25 per cent. metallic zinc or over of one cent per pound on the zinc in the ore. Certain reductions were provided for ores carrying less than 25 per cent. zinc, but such low-grade ores cannot be handled from this province, and we are concerned, therefore, only with the aforesaid maximum rate.

"This tariff has proved a serious blow to the producers of British Columbia zinc ores and concentrates, and to the production of lead, which in our deposits is usually found associated with zinc. A falling off in the production of one consequently entails a similar condition as to the other.

"As there are no works for the reduction of zinc ores in operation in Canada, and as distance and consequent high freight rates prohibit exportation to Europe, British Columbia producers have now either to ship to the United States for smelting in bond (the granting of such privilege resting with and being dependent upon the arrangements of the American smelters), the resulting product being sold in cheap foreign markets, or to the United States with payment of said onerous duties.

"These duties have prohibited business, except from exceptionally high-grade properties and one or two where a high-grade zinc concentrate is produced as a by-product in the milling of zinc-lead ores.

"Meanwhile Canada imports a considerable quantity of zinc and its products from the United States, so that while the producer of zinc ore in British Columbia has to sell at an exceedingly low figure, the products of his ore are returned to Canada as finished articles at a high figure, an anomaly which it would seem can best be removed through reciprocity.

"The effect of a reciprocal arrangement in regard to zinc may well be that for the present the smelting of our zinc ores will be carried on in the United States. Following the stimulation of a profitable market to production and development, should come such assured increased production as will justify the construction and operation of works in Canada. With a free market for their products, the advantage of reducing existing high

freight rates on ore should provide an incentive for such works.

"Reference has already been made to the indirect benefit which will be conferred on the established lead industry by the increased production of zinc ores.

"I have the honour to be, sir, your obedient servant,

"(Signed) J. L. RETALLACK."

OPINIONS OF DELEGATES.

T. G. Proctor strongly urged the passage of the resolution, as of the utmost importance to the zinc resources of the Kootenay.

H. Giegerich said the Dominion Government, in negotiating a reciprocity treaty, would have in view all the facts thus far presented, and particularly the fact that it had appropriated $50,000 for experimentation in reducing zinc ores, and would safeguard Canada's zinc interests. But this might take three years, and was nothing to be done in the meantime?

G. O. Buchanan said the resolution named not zinc ore merely, but zinc products, and those behind it would insist on that. If the processes were successful, and reciprocity of this kind were obtained, the American market would be absolutely open to the zinc products of the Kootenay.

PRODUCERS OF ZINC ORES.

Mr. Buchanan read from a memo. of Mr. Retallack's as follows: "In addition to the companies and interests represented by J. L. Retallack, viz., the Deep Mine, Limited, Whitewater; John L. Retallack & Co., Whitewater, and the Washington Mine, McGuigan, the memorial had been submitted to and approved by the following: A. J. Becker, for the Lucky Jim Zinc Mines, Limited; the Van Roi Mining Co., per Ernest Levy; the Consolidated Mining & Smelting Company of Canada, Limited, W. H. Aldridge, managing director; the Aurora Mining & Milling Co., of Moyie, per its manager; S. S. Fowler, for the New Canadian Metal Co., Limited; the Enterprise Mine, Limited; the Whitewater Mines, Limited, and other interests; Byron N. White, for the Slocan Star, etc.; A. Fournier, for the Selkirk Mines, Limited; James Anderson, for the Ruth Mines, Limited; the Jackson Mines, Limited; the Ferguson Mines, Limited; Alex. Smith, for the Surprise mine; H. Giegerich, for the Province Mine, etc.; John A. Thomson, managing director of the Mount Stephen Mining Syndicate, Field; and George Aylard, for the Standard Mine, Silverton." Mr. Retallack had received the assurance of the Ministers that if reciprocal arrangements were made, zinc products would be included.

RECIPROCITY IN LEAD.

Reciprocity in lead ores and manufactures was also discussed, and the following resolution, which was submitted by R. Campbell and J. W. Fitch, of the Moyie Board of Trade, was unanimously adopted by the convention:

"Whereas any measure of reciprocal trade with the United States which would permit the free entry of lead ores into that country without also providing for the free admission of pig lead and lead bullion, would, because of the higher price of lead products in the United States, draw away British Columbia lead ores to that country, thereby extinguishing within Canada the industries of smelting, refining, and manufacturing lead, which the Government of Canada has done so much to encourage; and whereas the ultimate effect of this would be to leave our producers of lead ores wholly at the mercy of the American Lead Trust: Therefore, be it resolved that the Associated Boards of Trade of Eastern British Columbia petition the Dominion Government that should they grant reciprocity to lead ores, they will insist that this reciprocal arrangement shall be extended to cover the entire lead schedule."

RESOLUTIONS PASSED IN BRITISH COLUMBIA.

In addition to resolutions relating to reciprocity in lead and zinc ores and manufactures, information concerning which is given separately, discussed by the recently-held annual convention of the Associated Boards of Trade of Eastern British Columbia, the following were adopted:

(1)—"Whereas there are large bodies of complex ores in British Columbia and elsewhere in Canada that cannot be economically treated by any known method; and whereas there is no public establishment in Canada for experimenting with or testing the treatment of such ores; and whereas this convention considers such work to legitimately belong to the Dominion of Canada: Therefore, be it resolved that the Associated Boards of Trade petition the Dominion Government to establish in connection with its Department of Mines a well equipped metallurgical laboratory and testing works, to be properly officered by qualified men, for solving the problems presented by the discovery of various complex ores, which cannot be treated economically at the present time."

(2)—"Resolved, that the resolution regarding the establishment of a Government assay office for the purchase of gold and silver bullion, passed at previous conventions, be re-affirmed, as follows: 'Whereas the only refinery in Canada producing gold and silver is located at Trail, British Columbia; Therefore, be it resolved that, in order that Canadian gold and silver may be used for coining purposes, the Dominion Government be requested to purchase gold and silver at Trail, B.C., on the same basis as the United States purchases these metals through its assay offices situated at Seattle, Wash.; Helena, Mont., and other places, and thereby prevent the exportation of Canadian gold and silver to the United States."

(3)—"Resolved, that we, the Associated Boards of Trade of Eastern British Columbia, desire to record our appreciation of Mr. W. H. Aldridge, who for many years has been managing director of the Consolidated Mining and Smelting Company of Canada, Limited, operating within our territory. Ever since the inception of this association, Mr. Aldridge has been one of its active members. He has been present at nearly all of its meetings, and has always manifested a lively interest, not only in matters pertaining to the mining and smelting industries with which he was identified, but also in all other matters affecting the general welfare of the country. We recognize Mr. Aldridge as a man of extraordinary ability in mining and metallurgy, and we deeply regret his removal from the province. We wish him great prosperity in his new sphere of action." (The secretary was instructed to forward to Mr. Aldridge a copy of this resolution.)

A resolution, submitted by Nelson delegates, providing that the Associated Boards shall petition the Provincial Government "to establish the mining school to be attached to the new University of British Columbia, or a branch of said school, in the Kootenays, and that this school be well-equipped and properly officered by qualified men," was withdrawn upon its becoming evident that a majority of the delegates agreed with G. O. Buchanan, of Kaslo, who expressed the opinion that the "mining school should be at the university, near the city of Vancouver, the Government having a large enough task to get the university started, without having a separate mining school, and dividing the faculty, thus decreasing its effectiveness."

A letter was received from a mine operator, suggesting that the Dominion Government when negotiating a reciprocity treaty with the United States, shall endeavour to have placed on the free list various mine supplies. It was decided to reply to the effect that the Associated Boards did not feel that they could agree upon a resolution that would embody their correspondent's views on this subject.

It was decided that the next annual convention shall be held at Rossland, B.C.

RAMBLER-CARIBOO MINE, SLOCAN, BRITISH COLUMBIA.

An important development in the Slocan district, British Columbia, was the recent opening on the 1050-foot level of the Rambler-Cariboo mine of a shoot of high-grade galena ore four to five feet in thickness. This has renewed interest in this mine, concerning which the following information is believed to be dependable:

The company, incorporated on July 31, 1899, as the Rambler-Cariboo Mines, Limited, has its head office in Spokane, Washington, U.S.A., and its British Columbia office at Kaslo, the Kootenay Lake terminus of the Kaslo & Slocan Railway. Mr. W. E. Zwicky is manager. The company's property embraces five mineral claims having a total area of 175 acres, situated in McGuigan Basin, Slocan mining division, and distant about three miles from the K. & S. Railway at McGuigan.

EARLIER DEVELOPMENT OF THE MINE.

Prior to 1904 development work consisted chiefly of a shaft with levels opened from it. This shaft was sunk from what is known as the 300-foot level, the original workings down to 300 feet having been adits driven in the mountain-side above. The shaft was sunk 500 feet and levels were opened at 100-foot intervals down to what is called the 800-foot level, below which depth it was not practicable to work the mine with the power plant then possessed, for in the spring of each year pumping, especially, would have been too heavy for the available power. By that time much ore had been extracted and from the profits earned $230,000 in dividends had been paid to stockholders. At the beginning of 1904 the directors found themselves in this position: they had to choose between (1) buying and putting in a larger power plant, (2) driving a long adit to cut the vein at a deeper level and at the same time provide for the drainage of the mine at little or no cost after the vein should have been intersected by such deep-level working, or (3) abandoning the mine. Another serious consideration was the altitude of the surface works—concentrating mill, mine buildings, etc.—situated at about 6,000 feet above sea-level, at which height snowslides were troublesome.

A DEEP-LEVEL ADIT.

In the foregoing circumstances Mr. Zwicky strongly recommended that a deep-level adit be driven. Eventually he was authorized by the directors to proceed with this important work, which was commenced on July 9, 1904, and completed on April 16, 1906. The portal of the adit is at an altitude 1,450 feet lower than that of the lowest outcrop of the vein, 2,400 feet below the apex outcrop on the summit of the mountain, and 650 feet lower than the eighth or former bottom level of the mine. At 4,523 feet from the portal of this adit driving was discontinued. The requisite grade having been maintained for draining off the water, the face of the adit is about 1,425 feet below the lowest outcrop of the vein. The writer has stood at the face of the adit and from there seen daylight at the portal distant nearly seven-eighths of a mile. The excellence of the engineering and workmanship in driving this adit, which is 7 feet by 7 feet 6 inches in the clear, was therefore plainly evident.

AN OFFICIAL DESCRIPTION.

Writing of conditions as he found them about the close of 1907, Mr. Robert R. Hedley, in his description for the Dominion Department of Mines' "Report on the Mining and Metallurgical Industries of Canada, 1907-8," observed: "The manager of the Rambler-Cariboo mine states that owing to some disturbance, or fault, at or about the point to which the vein had been projected on this level, the vein was not found, though the tunnel was driven some 90 feet beyond that point. He, consequently, decided to cut the vein at the nearest possible point under the main shaft. A diagonal drift was then run, and from this a raise was made to connect with the upper workings. In about 200 feet of raise the 1,250-foot level was reached and a cross-cut started. At 47 feet from the raise the vein was cut; it was found to be 8 feet wide and contained several streaks of clean galena. Raising was continued, and some driving done at the 1,150-foot level. Stations were established at the 9 and 10 levels. After connection had been made with the old workings some stoping was done in the upper levels, and the work of connecting with the tunnel by a suitable shaft was proceeded with. The necessary equipment was installed at the portal of the tunnel, and suitable cottages, bunkhouse, etc., for the new camp were erected near this lower entrance to the mine."

LATER DEVELOPMENTS.

The further exploration of the mine has been in continuous progress ever since the completion of the above-described development and equipment, except for a few weeks following a fire last summer. Old levels were extended and new levels driven, with the satisfactory result that orebodies were found on these down to the 1,050-foot level. By last summer everything was in readiness for regularly making comparatively large shipments of ore; but the fire came, destroyed mine buildings and all accessories to the compressor plant (though the compressor itself was not much damaged), took away transportation facilities by burning trestles and bridges along five or six miles of the railway, and left the undertaking temporarily at a standstill just when the outlook for large production and a return for years of plucky enterprise seemed within reach. However, the best was made of the position, and steps were promptly taken to overcome the fresh difficulties that had so unexpectedly beset the company. New buildings were erected at the mine, the compressor plant was restored to working order, wagon road communication was (with the assistance of the Provincial Government and the Lucky Jim Zinc Mines, Limited,) established with the C.P.R. Company's Sandon-Nakusp railway at Three Forks, distant about seven miles from the mine, and teams and sleighs were purchased for winter hauling. Snow was late in coming this winter, consequently it was not for some time practicable to haul ore all the way to Three Forks, but by the middle of December 4,000 sacks of ore and concentrate (for the mill was not destroyed by the fire) were hauled half-way to Three Forks, and later it was taken to the railway and shipped thence to the smeltery. It was estimated that while the sleighing should continue good shipments would total about 200 tons a month. The year's shipments prior to July 16, the date of the fire, totalled 601 tons of crude ore and 63 tons of concentrate. The smeltery returns for 1910 show a total of 802 tons received from this mine. Shipments in 1909 aggregated about 1,020 tons, this quantity including 340 tons of concentrate. No information is possessed relative to 1907 and 1908, but it is known that during the period 1893-1906, inclusive, the aggregate output was about 14,500 tons of ore and concentrate, with the following average metal contents: Lead, 37 per

cent.; zinc, 14 per cent., and silver, 127 oz. per ton. It would appear, therefore, that to date between 16,000 and 17,000 tons of ore has been shipped from this mine, which now has an excellent prospect of adding substantially to this comparatively large output tonnage.

A BRIGHT OUTLOOK.

The following comment, written last year, may be quoted as an appropriate conclusion to the foregoing information concerning the Rambler-Cariboo mine: "There is no doubt that the Rambler-Cariboo is now in better condition to return substantial profits above operating costs than at any other time for years. The successful outcome of the enterprise planned six years ago by Mr. Zwicky, whose wise foresight was not at that time generally recognized, is of much moment to the Sloean district as a whole. Recognition of the pluck of the directors of the Rambler-Cariboo company, themselves large stockholders, in financing what at first seemed a somewhat hazardous as well as costly undertaking, is also merited. They had faith, though, in their manager's skill and good judgment, and the sequel has proved that it was well grounded."

It may be added that there are now eight or ten mines in the Sloean district at which development in the deep has been carried out, and in most of them is being continued. The results are generally satisfactory, so that there seems to be good reason to think mining in the Sloean will be productive and profitable for years, and particularly so if it shall be found practicable to turn to profitable account the zinc contents of the ores as well as the silver and lead.

An English Compressed Air Mine Haulage Engine

BY FRANK C. PERKINS.

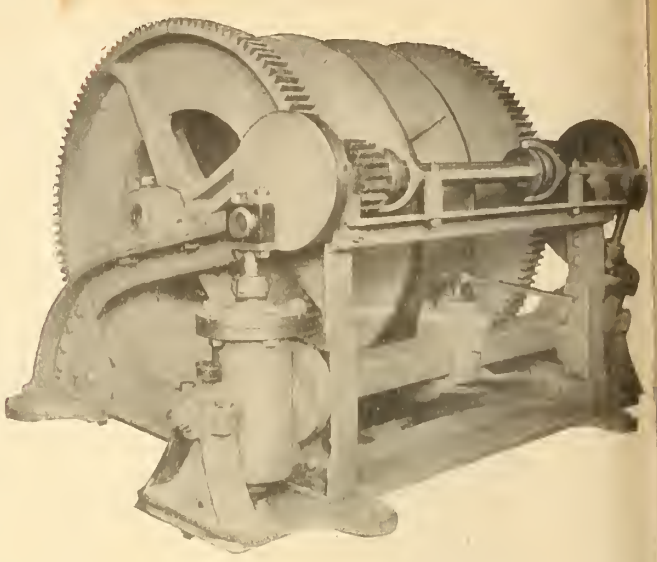
An English compressed air haulage engine of unique design is shown in the accompanying illustration, designed and built at Park Sheffield, England. It will be noted that the machine is constructed for lightness, combined with strength, and is portable, being quickly dismantled and installed in another part of the mine.

It will be seen that the drums, of which there are two, are easily rolled into their places, no lifting being necessary, and each drum is capable of containing 500 yards of ½-inch wire rope, which lead off in either direction, top or bottom. The gear is cast, the pinion being of cast steel, with double keys solid with the shaft, sliding in or out of gear as desired.

It is stated that the cylinders, although oscillating, give no trouble, as they are well supported on large trunnions and not fitted with glands, as the air does not pass through them, but through separately arranged ports upon a flat face. The faces are held together by a spring saucer washer, and a ball thrust ring, so that friction is reduced to a minimum, whilst the faces are light, so that no dust can get in.

It is claimed that the piston rods are the only working parts exposed to dust, and they are fitted with metallic packing, a white metal bush filling the stuffing box and the cylinders are placed behind the drums on the hoists of large size.

In this English air hoist the controlling valve is the leading feature. It is said to start, stop, reverse and regulate the speed to the greatest nicety with one lever, dispensing with all link motions, eccentrics, sliding valves and rod pins, which are liable to come loose and cause trouble.



It is maintained that freezing is impossible as th inlet and outlet passages are close together and th temperature is equalized. Powerful brakes are fitted t each drum, and the machines are so simple and access ible that they can be taken to pieces in 20 minutes an put together again in 40 minutes by two men withou difficulty.

In some mines where there are dangerous gases ther is a desire to dispense with ponies and at the same tim avoid the dangerous use of electricity in the mines This has led to the introduction of this new and ex ceedingly simple form of haulage gear and engin driven by compressed air.

Personal and General

Mr. P. Kirkegaard, managing director The Deloro Min ing & Reduction Co., Ltd., has resigned that position i order to devote his whole time to his other interests. Mr Kirkegaard and his associates, Messrs. MacKechnie and Hughes, recently bought the Belmont gold mine at Cordova, and it is their intention to start active work in the spring. Mr. Kirkegaard will act as managing director. His duties in this capacity will occupy only a part of his time, and he will be able to direct operations on various properties in Cobalt, Gowganda, Porcupine, and elsewhere. Mr. S. B. Wright has been appointed manager at Deloro, and Mr. T. Melvar, chief chemist, assumes the added duties of superintendent.

Mr. R. B. Lamb, mining engineer, Toronto, is in Porcupine on professional business.

Mr. Alexander Grant, manager of the Marble Bay gold-copper mine, near Van Anda, Texada Island, B.C., is convalescent and has resumed his duties at the mine after having been ill at Victoria nearly all the winter.

Mr. W. H. Trewartha-James, of Victoria, B.C., general manager of the Tyee Copper Company, Limited, was in New York early in February. He contemplated going thence to England on a business visit, before returning to British Columbia.

Among the Cariboo district hydraulic placer-gold mining men who have been spending the winter in one or other of the Coast cities, are Mr. John B. Hobson, who has been at his home in Victoria; Mr. John Hopp, whose Coast home is in Seattle, Washington, and Mr. Mel-

bourne Bailey, whose family residence is in Tacoma, Washington.

Mr. Thomas Kiddie, of Vancouver, B.C., has again been superintending trials of oil as fuel for smelting copper ores, at the Van Anda smeltery, Texada Island, B.C. The demonstrations made at those works during recent months have attracted the attention of several other metallurgists, who are also much interested in the considerable measure of success that has been achieved.

Late movements of British Columbia mining engineers or managers include the following: Mr. J. W. Bryant, the Tyee Copper Company's senior field mining engineer, is in charge of the development work that company is engaged in at the Cornell gold-copper mine on Texada Island; Mr. Lewis Hind, of Hind & Cane, mining engineers, Victoria, has returned from a professional visit to Mexico and southern California; Mr. Louis Pratt, formerly manager of silver-lead mines in the Slocan district, has again gone to England in connection with Messrs. P. Burns & Company's mining business.

Arrangements were made during the early part of February by a number of men prominently associated with the industrial, commercial, and financial interests of the Kootenay district of British Columbia, to entertain at a valedictory banquet, Mr. W. H. Aldridge, late managing director of the Consolidated Mining & Smelting Company of Canada, Limited, who recently retired from the general management of the company's big mining and smelting business. The date of the banquet was to be dependent on Mr. Aldridge's convenience—probably late in February, when he was expected to return to Trail, B.C., on a brief visit.

There have been several recent changes in connection with western coal mines; among them the following: Mr. F. W. Guernsey, formerly of Trail, B.C., is now manager of the Bankhead colliery, Alberta; Mr. J. Robertson has been appointed manager for the Head Syndicate, Ltd., which is developing a valuable coal property adjoining on the south that of the International Coal & Coke Co., Ltd., in southwestern Alberta; Mr. Jas. Holden has succeeded Mr. Chas. Graham as superintendent of the Princeton Coal & Land Company's colliery at Princeton, Similkameen, B.C.; Mr. Andrew Bryden, for years manager of the Dunsmuirs' Extension colliery, Vancouver Island, is superintending the development of the Coal Hill Syndicate's property in Nicola Valley; Mr. Edward Hodgson, of Victoria, and associate capitalists resident in New York, are stated to have obtained control of the Pacific Coast Coal Company, operating on Vancouver Island, and will shortly assume full charge of the company's mines and offices. It is reported that Mr. W. R. Wilson, who some years ago was with the Crow's Nest Pass Coal Company, is expected to again become connected with the operation of that company's coal mines in southeast Kootenay.

SPECIAL CORRESPONDENCE

ONTARIO.

Cobalt and Other Silver Areas.

The pressure from the Hydraulic power plant is still low though the plant at Ragged Chutes has now been completely repaired. There is a shortage of water but the tributary dams on the Montreal should give all the pressure desired in a few days.

The Nova Scotia ran into a very rich but short ore shoot on the 79-foot level. For ten to twelve feet the vein was extremely rich and about five inches wide. Some beautiful leaf silver was also taken out of the diabase wall rock.

On the T. & H. B. claims in the Hangingstone section of Gowganda three shafts have been put down on separate veins. One, down 80 feet, still shows excellent high grade silver ore and another at 50 feet is also rich, while in the third shaft there is heavy smaltite. A bigger plant is being taken in.

The thawing house at the Beaver mine was destroyed, and an Austrian, George Ranik, killed instantly, by the explosion of 300 pounds of dynamite in the early part of last week. Some of the camp buildings were wrecked.

In the Gowganda section the Bartlett and Reeves Dobie have both shipped high grade ore. The Reeves Dobie has sent out about four tons of concentrates from its mill, which at the present time is not operating. The Bartlett despatched five tons from an open cut.

The Welsh property, in which the Farmers Bank is stated to have an interest, is to open up operations very shortly with power from the Bartlett. A very considerable amount of development work has been done to date.

The Wettlaufer has just shipped another 30-ton car of high grade ore which will run between 3,000 and 4,000 ounces to the ton. The shaft at this South Lorrain property is down 240 feet, with a winze 60 feet deeper and still in ore.

In the Gowganda district the Miller Lake O'Brien to date has shipped 54 tons of ore, containing 150,000 ounces of silver, and it is now producing at the rate of $15,000 per month. There is an ore body 275 feet long at the 90-foot level and 80 feet long at the 140-foot level, with excellent high grade in the heading of the south drift. It is stated that there are two years' reserves now in sight.

In the Lost Lake section of the Montreal River Company the Calcite Lake Mining Company has recently run into a vein of good ore at the 125-foot level. It has been opened up for twelve feet from two to three inches wide and will run about two thousand ounces.

The Nipissing report for January shows that the company mined ore of an estimated value of $200,821 net, and shipped ore worth $165,768. The principal development was at shaft 64, where an ore body 40 feet long has been extended for another 54 feet, and for that distance is eight inches wide of very rich ore. The drift of 54 feet yielded at the rate of $960 per foot.

At the present time the Beaver has in its No. 5 vein at the 300-foot level one of the most spectacular showings in the camp. At the top of a small stope there is 21 inches of 6,000 or 7,000 ounce ore and the average for ten to fifteen feet will be 18 inches. The Beaver has two exposures of high grade ore on No. 5 vein at the 300-foot and is still stoping on ore at the 200-foot level. No. 3 vein is also showing up well.

The revelation of over-issue of capital at Little Nipissing has temporarily closed down the mine till after the meeting when the financial matters have been straightened out. The Little Nipissing has had some rich pockets of ore, but they were very short. There is still some high grade unstoped in the mine.

Porcupine and Other Gold Areas.

A drift has now been opened on one vein of the Hollinger at the 100-foot level for 1,200 feet. A winze has been sunk another 100 feet, and is still in ore. All the stamps and mortars for the 30-stamp customs mill have arrived and it is believed will be in operation by July at latest.

A diamond drill core from the 200-foot level of the Rea Mines, the Goldfields Consolidated holding in Porcupine, shows considerable values in free gold. Thus another property has proven values at depth.

Since it is believed that there will be an early break-up many properties are rushing in small plants. The Preston East Dome,

the Tisdale, and the Armstrong Booth have all ordered small plants to be delivered at once.

After working for almost three years the Swastika mine in Otto township has now got excellent gold values in a winze 25 feet below the 100-foot level. The little mill has produced 50 ounces. A new stamp mill has been erected and will be running in a few days. The property is located in a section that has generally been discredited as a mining area.

The first gold brick from the little Nissen mill at the Vipond property has just been sent to the company's offices in New York. The brick weighs 92 ounces and is stated to be worth $1,700.

The English house of Bewick, Moreing & Co. is stated to have taken up on option the 50 undeveloped claims of the Timmins McMartin Dunlap syndicate and an immediate expenditure of half a million dollars to open them up is guaranteed.

Mr. F. Augustus Heinze, who has had an option on the Foster property, is going to test the formation at depth with two shot drills. Mr. Bob Weiss is in charge of the property.

W. S. Edwards, one of the stakers of the Dome property, has taken an option on the Smith veteran, upon which a good find was made recently. He has sampled and examined it thoroughly.

An extremely good find in the Cripple Creek district is recorded on the Carleton claims. Free gold in the blue quartz was discovered at the bottom of a 12-foot shaft. The assays are uniform, but specimens are not as spectacular as in Porcupine itself.

The discovery of excellent free gold values at the Swastika mine in Otto township may put new life into the Larder Lake field. The values first became good at the 100-foot level and spectacular in the winze 25 feet below. The persistence of values to depth has caused a rush of prospectors to take up expired claims. The property has been operated by a Tavistock, Ont., syndicate for almost three years now. A small three-stamp mill will be replaced shortly by a new five-stamp mill. The little property has already produced 50 ounces of gold.

Many properties are now ordering small plants before the break up and the consequent demoralization of the roads. Among these are the Tisdale Mining Company, the Booth Armstrong, and the Imperial Porcupine.

The Standard Gold Mines in Deloro township will let a contract for a thousand feet of diamond drilling on its claims. A small plant will also be shipped directly the railroad reaches Porcupine. The company owns what are known as the Silver properties.

The magic word "tellurides" has again precipitated a rush directly south to the Bartlett township and the Sudbury division directly south of it. So far the statement of the prospectors, who declare they found telluride ore down there, has not been corroborated. A Cobalt firm of assayers made the declaration of gold in the ore.

GENERAL MINING NEWS.

NOVA SCOTIA.

GLACE BAY.—All of the collieries of the Dominion Coal Company are working actively and an exceptionally large tonnage is being banked in preparation for the present year's expected record output and shipments. About 12,000 tons a day is now being hoisted.

SYDNEY.—Malcolm Beaton, former manager of the Inverness and Richmond Coal Company, has taken a position with the Dominion Coal Company, and has entered on his duties as manager of No. 16 colliery.

NEW BRUNSWICK.

ST. JOHN, N.B., Feb. 13.—What is declared to be probably the most valuable cargo ever sent from a Canadian port is on board the C.P.R. liner Empress of Ireland, sailing from this port Friday for Liverpool. The value is $393,000. Included are two tons of Cobalt bar silver and 250 tons of nickel copper matte, the latter for British navy armour plate.

QUEBEC.

MONTREAL.—Following is an abstract of the report of Mr. Edward Slade, managing director of the Black Lake Consolidated Asbestos Company:

The mill is designed to operate as two independent units, each unit producing identically the same grades.

It will be interesting to know that the mill will handle, without crowding, one thousand tons of rock per day of 20 hours, an actual run of over 600 tons having been made with one-half the mill on several occasions.

With a view to testing out thoroughly the new process of treatment adopted in order to produce the most marketable grades, the work during a considerable portion of last season was largely experimental and we purposely delayed the completion of the second unit until the end of the year.

The mill is now complete in every detail and the grades thoroughly established so that now the mill is ready to operate at full capacity as soon as weather conditions permit. During this period the company produced 3,046 tons of asbestos of various grades. Of this, 837 tons have been shipped. Owing to the satisfactory character of our grading, contracts have already been closed for 2,400 tons additional and negotiations are pending for over 3,000 tons more, so that the sale of our entire output is now fairly well assured.

It is gratifying to be able to state that the pits, which have been developed to date, have more than realized our expectations. The quantities of high grade asbestos are steadily increasing as the pits are enlarged, so that with the addition of the extra hoists referred to above we can be assured of a continuous supply of mill rock, the quantities of which in sight and proven are practically inexhaustible.

I can safely state that the property is now in a position to earn all its fixed charges, and a substantial surplus.

ONTARIO.

COBALT, Feb. 18.—The Wettlaufer mine of South Lorrain is making a shipment of high-grade ore through Haileybury.

SAULT STE. MARIE, Feb. 23.—J. J. Byrne, who has been interested in gold and silver discoveries at Cobalt, Porcupine, and Gowganda, returned to the Soo yesterday afternoon from Hobon, the new gold field discovered by Wm. Noquist, of the Soo, last November. Mr. Byrne, with Mr. J. Hollinger, have staked 16 claims at Hobon, adjoining the Noquist claims, and all show rich values. Assays made on ore run from $6.60 to $400 to the ton. It is expected that with the advent of spring a rush will bo made to Hobon.

COPPER CLIFF.—Mr. A. P. Turner, president of the Canadian Copper Company, has gone south on account of his health, and expects to remain in Florida for a couple of months. He has always been a vigorous worker and has well earned a rest. Mr. John Lawson, who has been his right hand man, is also unfortunately ill, and is on a course among the islands of the West Indies. He is rapidly recovering and is expected in Copper Cliff again early next month. Meantime, Mr. D. H. Browne, Chief Metallurgist, has charge of operations.

PORCUPINE CITY, Feb. 13.—Messrs. Pope and Kuehn, in the employ of Bewick-Moreing, have been here three weeks sampling veins on the Feldon properties which were sold to P. Kirkegaard, of Deloro, Ont., and the John Gray properties in Ogden.

To date, a total of 72 claims in the townships of Whitney, Tisdale, Deloro, Shaw, Carman, Munro, and Langmuir, have been placed in the hands of Mr. McConnell, of Montreal.

BRITISH COLUMBIA.

NELSON.—The Molly Gibson mine has again commenced to ship ore to the smelter, a number of sleigh loads having been brought from the end of the tramway to the landing at Kokanee during the past few days. The ore is being left at the landing pending the arrival of a barge when it will be shipped to the smelter at Trail.

The new tramway, which contains one of the longest spans in the province, is working smoothly. It is a trifle over four and a half miles in length and the long span is over a mile long. The successful building of this tramway, which was for the purpose of carrying the ore from the mine over the portion of the road frequently impassable in the winter and spring owing to snowslides, is considered a fine piece of engineering work, the construction of the long span having presented exceptional difficulties.

With the new tramway in working order and with a large supply of ore on hand in the mine, the Molly Gibson is expected to be a regular shipper from now onwards.

NEW DENVER, Feb. 16.—The Sweet Grass lessees have struck a good vein of high grade ore in their No. 2 tunnel.

Three carloads of machinery for the Van Roi mine at Silverton, arrived last week.

With the opening of the Van Roi new mill and a large staff of men at the mine, the working of the Standard mine on a larger scale, whether Patsy Clarke takes up his option or not, the operating of the Enterprise, Slocan Star, Ruth, Hope, Evening, McAllister, Reco, Richmond-Eureka, Sweet Grass, Molly Hughes, Neglected, Jo-Jo, etc., the spring outlook for mining in the Slocan district and New Denver and Silverton is of the brightest.

The Noble Five mine at Cody shipped a car of high grade silver galena ore this week, the first in ten years. Development work will be kept up all winter. T. L. McAllister, of Cody, is in charge.

New Denver merchants complain bitterly of Nelson and coast wholesalers selling to the mines in this vicinity at wholesale prices.

NELSON, Feb. 18.—The Phoenix Amalgamated, Ottawa, Knob Mill, and Noble Five mines joined the shipping list the past week. The Phoenix Amalgamated is the property of the Consolidated Mining & Smelting Company, on which work was recently resumed. The Ottawa is a silver-lead mine at Slocan City, and was a shipper last year. The Noble Five is a silver-lead property that has long been off the shipping list, and is one of the Cody mines. The Knob Hill is in the Republic camp in Washington.

MINING NEWS OF THE WORLD.

UNITED STATES.

BAKERSFIELD, CAL., Feb. 21.—During January there was a decline of 119,497 barrels in the production of oil in California, compared with the production of December. The January output amounted to 5,993,300 barrels, and that of December to 6,111,807. The daily average of January production was 193,300 barrels and that of December 197,155.

CRIPPLE CREEK, COLO., Feb. 20.—The project for a third deep drainage tunnel is still to be considered after Engineer T. R. Counryman has made his report, according to President Frank G. Peck, of the Cripple Creek Drainage & Tunnel Company, who was one of the committee to visit the district and inspected the Roosevelt tunnel.

BUTTE, MONT., Feb. 14.—A company with a capital of $1,500,000 is being organized by capitalists of this city and the East for the purpose of constructing an electric railway for the hauling of ore from the Silver Lake district to Anaconda. In this district is located the celebrated Southern Cross mine, which eastern men inspected about one year ago and on which they had an option and afterwards relinquished. That property has now 75 men at work and is shipping its ore to the Washoe smelter, necessitating a waggon haul of 12 miles.

SPOKANE, WASH., Feb. 18.—Bunker Hill and Sullivan Mining & Concentrating Company, operating at Kellogg, Idaho, brought its total disbursements to date to $12,456,000 by the payment of dividend No. 161, amounting to $81,750, a few days ago. One hundred and sixty-three thousand five hundred dollars has been paid so far this year. The Bunker Hill property is declared by experts to be the greatest dividend-paying silver-lead property in the United States, if not in the world.

MEXICO.

PARRAL, Feb. 21.—Another big strike has been made at the Santa Ines property of silver ore running 20 kilos. The engineer advises that values are increasing with depth. The depth reached so far is 125 metres.

CANANEA, SONORA, Feb. 21.—While there is nothing of the sensationalism in development among the mines of the State of Sonora, there is, however, a widespread development of old and new properties unattended by excitement that is accomplishing more substantial good than has yet been vouchsafed the industry. All work is systematic and is being conducted by strong financial interests.

SOUTH AFRICA.

JOHANNESBURG, Feb. 7th.—Three hundred out of the Randfontein Central's full mill of 600 stamps are to be dropped on Wednesday.

At the meeting of the Randfontein Estates the chairman announced that henceforward profits would be devoted to dividends.

The Langlaagte Estates has acquired mining rights on a bewaarplaatsen area.

COMPANY NOTES

CROWN RESERVE.

The Crown Reserve directors met Feb. 13th and declared the second of the monthly dividends of 5 per cent. It is payable March 15 to shareholders of February 28. The finances are still in fine shape, and after paying the dividend and all other charges $20,000 will be added to the reserve.

RIGHT OF WAY.

The report of the Right of Way Mines, Limited, for 1910, shows that the ore sales amounted to $233,838. Four quarterly dividends of two per cent., at the rate of eight per cent. per annum, were paid, amounting to $134,840. A balance of $45,027 remains to the credit of profit and loss account. At the end of the year the company had cash on hand and due from smelters, $76,361. The total assets of the company, including mine property, plant, etc., amount to $1,784,388, and the issued capital stock is $1,685,500. The old board of directors was re-elected.

BAILEY.

At the annual meeting of the Bailey Cobalt is was shown that the company had a surplus of $26,529 in addition to 413 pounds of bullion and seven bars of silver, as well as a car of ore about ready to ship, expected to return about $20,000.

N. S. STEEL & COAL CO.

The Nova Scotia Steel & Coal financial report for year ending December 31, 1910, shows profits of $1,140,504.37, which, with reductions in fixed charges, enabled the directors to declare an increase in dividend to 6 per cent. President Harris says the dividend has not been increased without careful consideration.

In 1909 profits were $907,949, and at that time were about $200,000 in excess of 1908.

The following is taken from the president's report:

The balance carried forward to credit of Profit and Loss, January 1st, 1910, was $336,807.38, which, added to the profits for the year, gives a sum of $1,477,311.75, at the credit of this account.

The sum of $79,371 has been transferred to Reserve Fund, and $6,344 to Fire Insurance Fund; $218,104.80 written off, which includes the entire amount paid for discount and expense on the new bonds issued during the year, as well as a considerable sum paid for improvements and betterments.

After fixed charges and dividends there remains a balance to the credit of profit and loss account of $500,602.95. The sum of $908,362.63 has been expended during the year on capital account.

TEMISKAMING.

At the annual meeting of shareholders on Feb. 18th, the statement for the eleven months to Dec. 31, 1910, was presented. Formerly the company's year ended Jan. 31, but last year it was changed to the calendar year so that the period covered is for only eleven months.

The income for the eleven months amounted in all to $1,022,390.52 and the expenditure to $308,071.01, leaving a profit of $714,319.51, which amounts to some 35 per cent. of the capitalization. The income of the previous year amounted to $345,306.60.

"It is gratifying to be able to report that high-grade ore is now being encountered at a depth of 540 feet from the surface," said President Cartwright in his address. "The formation is here found to be unchanged."

"Our ore still maintains its high silver values. The average of the 1,029 tons of all grades produced during the year was 1,819 ounces to the ton, and that of the 359 tons produced from the sorting tables and shipped was 3,715 ounces to the ton. We believe these to be the highest averages in the camp, which is interesting from the fact that it is won from Cobalt's deepest workings."

WESTERN COKE & COAL.

Tho Western Coke & Coal Company, at its annual meeting at Montreal, heard the reports of the various officers who told that by August of this year it is expected that the company will be able to produce from its coal fields about 1,000 tons of coal per day. The company has a paid-up capital of $2,300,000, and is engaged in coal mining thirteen miles from Pincher Creek, near the Crow's Nest Pass. The directors re-elected are: Messrs. E. B. Greenshields, Hon. Robert Mackay, J. W. McConnell, H. A. Lovett, K.C., Charles Fergie, and Nathaniel Curry.

AMALGAMATED ASBESTOS.

The annual general meeting of the Amalgamated Asbestos Corporation will be held on March 8. It is understood that the shareholders will be told of the greatly improved circumstances financial and physical.

STATISTICS AND RETURNS

TORONTO MARKETS.

Feb. 24. (Quotations from Canada Metal Co., Toronto):
Spelter, 5.60 cents per lb.
Lead, 3.65 cents per lb.
Antimony, 8 to 8½ cents per lb.
Tin, 44 cents per lb.
Copper, casting, 13.25 cents per lb.
Electrolytic, 13.25 cents per lb.
Ingot brass, 8 to 12½ cents per lb.

Feb. 24—Pig Iron.—(Quotations from Drummond, McCall Co., Toronto):
Summerlee No. 1, $23.00 (f.o.b. Toronto).
Summerlee No. 2, $22.50 (f.o.b. Toronto).
Midland No. 1, $20.00 (f.o.b. Toronto).
Midland No. 2, $19.50 (f.o.b. Toronto).
Hamilton No. 1, $18.50 (f.o.b. Hamilton).
Hamilton No. 2, $18.00 (f.o.b. Hamilton).
Clarence, $20,00 (f.o.b. Toronto).
Cleveland, $20.00 (f.o.b. Toronto).

GENERAL MARKETS.

Coal, anthracite, $5.50 to $6.75.
Coal, bituminous, $3.50 to $4.50 for 1¼-inch lump.

COKE.

Feb. 21.—Connellsville Coke (f.o.b. ovens).
Furnace Coke, prompt, $1.50 to $1.60 per ton.
Foundry Coke, prompt, $2.00 to $2.15 per ton.

Feb. 21.—Tin (Straits), 44.25 cents.
Copper, Prime Lake, 12.75 cents.
Electrolytic copper, 12.50 cents.
Copper wire, 14.00 cents.
Lead, 4.50 cents.
Spelter, 5.75 cents.
Sheet zinc (f.o.b. smelter), 7.50 cents.
Antimony, Cookson's, 8.50 cents.
Aluminium, 21.00 to 21.50 cents.
Nickel, 40.00 to 45.00 cents.
Platinum, ordinary, $38.50 per ounce.
Platinum, hard, $41.00 per ounce.
Bismuth, $2.00 to $2.10 per lb.
Quicksilver, $48.00 per 75-lb. flask.

COBALT ORE SHIPMENTS.

Following are the shipments from the Cobalt camp for the week ending Feb. 17, and those from Jan. 1, 1911, to date:

	Feb. 17 Ore in lbs.	Since Jan. 1 Ore in lbs.
Beaver	53,060	310,520
Buffalo	60,110	368,130
Chambers-Ferland	.....	128,900
City of Cobalt	.....	126,280
Cobalt Lake	60,000	380,540
Cobalt Townsite	.....	249,740
Coniagas	.....	504,450
Crown Reserve	56,800	276,540
Hudson Bay	61,110	122,350
La Rose	226,090	807,420
Kerr Lake	60,040	661,419
King Edward	40,000	40,000
McKinley-Dar-Savage	59,800	753,070
Nipissing	186,890	1,323,120
O'Brien	60,000	205,210
Peterson Lake (Little Nip.)	.....	58,430
Right of Way	.....	193,550
Silver Cliff	.....	47,920
Temiskaming	.....	283,195
Trethewey	.....	139,250

The shipments for the week were 933,960 pounds, or 466 tons.

The shipments from Jan. 1 to Feb. 17 were 6,980,034 pounds, or 3,490 tons.

BRITISH COLUMBIA ORE SHIPMENTS.

The following are the returns of the ore production and movement for the week ending February 11th:

Boundary Shipments.

Granby	25,507	137,172

Prompt and Satisfactory Returns

The North American Life is continually receiving from policyholders unsolicited letters like the following, expressive of their appreciation of the treatment accorded them and results attained:

The holder of Policy No 8192 wrote:—
"I appreciate the promptness with which you have remitted the amount due me. I may say that I have nothing but praise for your company for the very satisfactory way in which I have always been treated. Our business relations have been very pleasant and I wish the North American Life the future success it so well merits."

The holder of Policy No. 9205 said:—
"I cannot close matters with the company without expressing my great appreciation of its methods and the very fine manner in which I have been treated by its representatives. In the 20 years of dealing I can recall no single instance in which I have received anything but courtesy and business promptness. I hope to renew relations with the North American soon in respect to my children's insurance."

The Financial Position of the Company is Unexcelled.

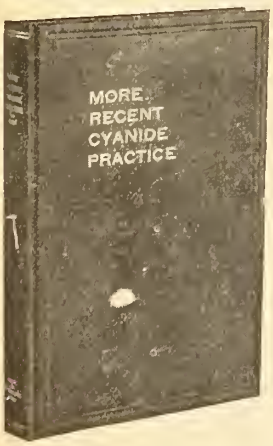
THE EXPERIENCE OF EXPERTS



More Recent Cyanide Practice

EDITED BY

H. FOSTER BAIN

424 Pages Indexed Illustrated

$2 POSTPAID

There is no information so valuable as the experience of the men who have designed, built, and operated notable mills, or the chemists and metallurgists who have solved difficult problems as they arose. This book contains articles by 82 men, among whom are the leaders in the cyanide industry. It is valuable as a handbook and together with the companion volume, 'Recent Cyanide Practice', makes an interesting compendium of the cyanide process.

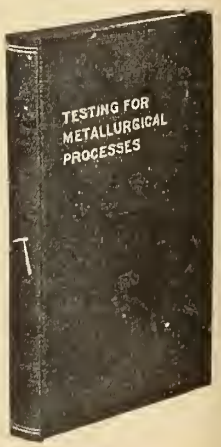
Testing for Metallurgical Processes



By JAMES A. BARR

216 pages
Illustrated
Indexed

$2 POSTPAID

This book is designed to assist in the selection of the process of treatment for any ore. The author describes the apparatus employed in making laboratory and small-lot tests. It is founded upon experimental work at the Michigan College of Mines, and the methods recommended have been tested in practice. It is brief and practical, equally valuable to the student and the practicing engineer.

Canadian Mining Journal, Toronto

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining ngineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show gns of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a orough knowledge of Mining Law, should be very careful with whom they place their business.

DEPARTMENT OF MINES. GEOLOGICAL SURVEY.

PUBLICATIONS

The Geological Survey has published maps and reports dealing with a large part of Canada, with many local areas and special subjects.

A single copy of a map or report that is specially desired will be sent to Canadian applicants free of cost and to others at a nominal price.

Most of the older reports are out of print, but they may usually be found in public libraries, libraries of the Canadian Mining Institute, etc.

A catalogue of publications will be sent free to any applicant. Reports that are out of print are indicated in the catalogue by a dagger.

Applications for publications should be addressed to the Director, Geological Survey, Ottawa, and should state definitely the precise area concerning which information is desired. It is often of assistance in satisfactorily filling an order for a map or report, if the applicant states the use for which it is intended. Letters and samples that are of a Departmental nature, addressed to the Director may be mailed O.H.M.S. free of postage.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.

The Michaelsen Ore Crusher and Pulverizer

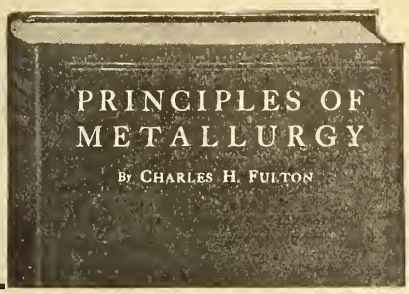
CHARLES O. MICHAELSEN, owner of Pat. No. 113991 is now prepared to furnish to the mining trade a new device in the line of an **Ore Crusher and Pulverizer.** This Crusher and Pulverizer is unexcelled in capacity, economy of power, economy of labor and repairs, and most essential of all, it accomplishes even pulverization.

MANUFACTURED BY

Northern Foundry & Machine Co., Ltd.

SAULT STE. MARIE, ONTARIO, CANADA

For further particulars address CHAS. O. MICHAELSEN, care of Northern Foundry and Machine Co.



THE standard treatise in English on general metallurgy. It is of the highest value and greatest practical use to every metallurgist. The sections on Alloys, Measurements of High Temperatures, Slags and Mattes are very important.

The author is President and Professor of Metallurgy, at the South Dakota School of Mines.

The Main Chapter Headings Are:

I.—The Metals and Metallurgy from the Historic Point of View. II.—Physical Mixtures and Thermal Analysis. III.—Physical Properties of Metals. IV.—Alloys. V.—The Physical Properties of Alloys. VI.—The Measurement of High Temperature. VII.—Typical Metallurgical Operations. VIII.—Slags. IX.—Matte, Bullion and Speiss. X.—Refractory Material for Furnaces. XI.—Fuels. XII.—Combustion. XIII.—The Production and Heating of Blast Furnaces. XIV.—An Example Illustrating the Physics and Chemistry of a Melting Operation. The Blast Furnace for Copper.

536 pages, 6x9, 188 illustrations, $5.00 (21s) net, postpaid.

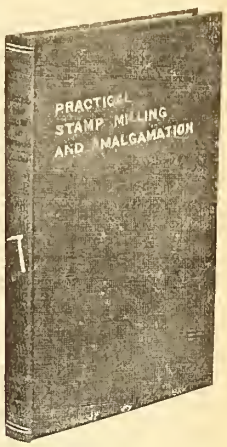
FOR THE MILLMAN

Practical Stamp Milling and Amalgamation



By H. W. MacFARREN

166 PAGES INDEXED

$2 POSTPAID

Written primarily for the millman himself, this book will prove of value to all those having to do with the milling of gold ores. Gives details needed in everyday work. The stamp mill, its location, and design; the mortar, die, shoes, tappet, and cam; adjustment of height, order of drop, feeder, and screens; water supply and power; principles of amalgamation and treatment of plates; retorting; loss of gold, mill tests, and mill management; all these are treated in an illuminating manner by one who has himself solved the problems.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals, extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The silver mines of the Cobalt district have astonished the world by their richness, and promising gold discoveries have recently been made in Porcupine Lake.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are: Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows:

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unsurveyed territory, is open to prospecting.

Miners' Certificates good for a calendar year may be obtained by sending $10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minimum being 40 acres in unsurveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of $10.00 plus a yearly rental of $1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed territory may be purchased as a mining concession at the price of $20.00 per acre if within 20 miles of a railway in a straight line, or $10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

The Hon. Minister of Colonization, Mines and Fisheries.
Quebec.

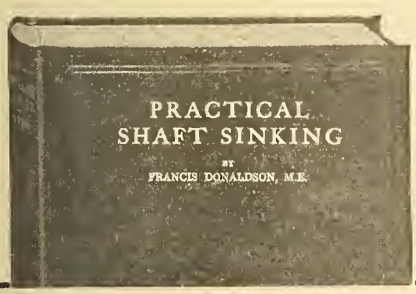
A. T. LAING.



143 pages, 6x9, illustrated, $2.00 (8/6) net, postpaid.

A book treating in a practical way all the problems of shaft sinking under diverse conditions.

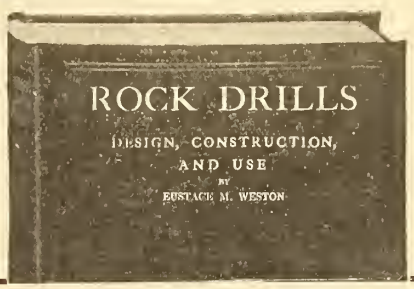
It has much material on the plant required, various methods of sinking, types and requirements of pumps, cementation, concrete linings, etc.

It is especially valuable *for its data on costs.*

Mr. Donaldson is chief engineer of the Dravo Contracting Co.

CONTENTS

Chapter I.—Some Deep Shafts—Features of Contracts for Sinking—Form of Contract. II.—Plant Required—Boilers, Hoisting Engines, Head-Frame and Bucket Air Compressors. III.—Sinking through Surface—Soft Ground—Wooden Sheeting—Steel Sheeting—Caissons of Steel, Wood or Concrete. IV.—Sinking through Soft Ground—Pneumatic Process—Shield Method. V.—Sinking in Rock—Arrangement of Holes—Tools and Methods used in Drilling—Costs and Speed. VI.—The Sinking-Drum Process—Mammoth Pump—The Freezing Process. VII.—The Kind-Chaudron Boring Process—Cementation of Water-Bearing Fissures. VIII.—Lifting Water—Horizontal vs. Vertical Pumps—Handling Pumps in Shaft—Cornish Pumps. IX.—Shaft Linings. X.—Concrete Linings—Costs per Linear Foot for Rectangular, Elliptical and Quadrilateral Shafts.



370 pages, 6x9, illustrated, $4.00 (17s) net, postpaid.

A treatise for engineers who have to select and use rock drills. It will prove a valuable handbook for all with problems in rock excavation.

Describes first the various types of rock drills in established use, their design and efficiency. It covers further the operation on the surface and underground with valuable chapters on practice in America, Australia and Africa. *It has important data on costs.*

CONTENTS

Preface. I.—Historical Sketch. II.—Standard Piston Drills. III.—Hammer Drills. IV.—Electric Drills. V.—Operating Rock Drills on the Surface and Underground. VI.—Piston Drills Designed to Use Air Expansively. VII.—Philosophy of the Process of Drilling Rock. VIII.—Repair and Maintenance of Rock Drills. IX.—Drill Steel and Drill Bits. X.—Explosives and Their Use. XI.—Theory of Blasting With High Explosives. XII.—Examples of Rock Drill Practice, Africa and Australia. XIII.—Examples of Rock Drill Practice, America. XIV.—Rock Drill Tests and Contests. XV.—Dusts and Its Prevention. XVI.—Notes on the Use of Compressed Air.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silv $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minera or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,(the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land h been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in t Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

MONCTON, N.B.

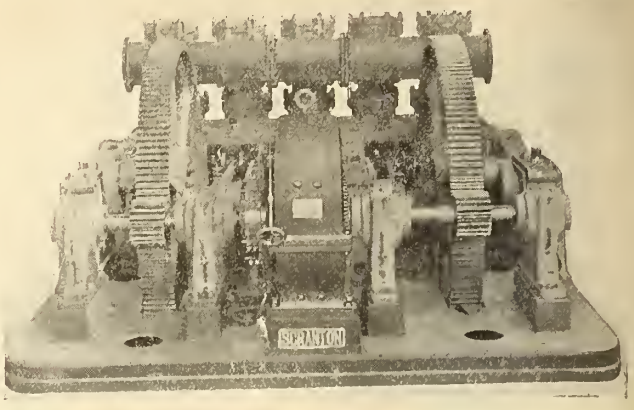
Westinghouse Motors

are driving Mine Pumps in every corner of the Globe.

Reliability is a strong feature of these motors. The mine operator knows that, once installed the motor will do the rest.

It may be made to stop and start automatically. The only necessary supervision being periodical filling of the oil chambers.

A Westinghouse Motor is very much simpler than any steam engine. It has no reciprocating parts; no pistons to wear and require packing: causes no dirt, exhaust steam or vibration, and is always instantly ready for service. The bearings are self-oiling, requiring only occasional inspection.



Westinghouse 200 H.P., 500 Volt Type, "E M" Motor Driving 11 x 18 Quintuplex Pump, 2,000 gal. Capacity, 250-ft. Head.

Send for a copy of Circular No. 1512, it shows Westinghouse Motors driving all kinds of pumps.

Three Post Magneto Electric Blasting Machine

NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

"WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. **It does not freeze,** or rather, explodes with perfect efficiency when frozen **and needs no thawing.**

"AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appear ance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

PERMITTED EXPLOSIVES for Coal Mines

Amatite ROOFING

Amatite is inexpensive, easy to put on, requires no care or attention or expense afterwards, and gives excellent durability.

Ordinary smooth roofing requires painting every year or two at considerable expense and trouble. Amatite, however, has a mineral surface which *requires no painting.*

Use Amatite for every roof where you want to save expense. It is the most economical solution of the whole roofing problem.

Amatite Roofing requires no skilled labor to apply; it costs no more, (in fact much less) than other roofings; and the fact that it requires no painting makes the total expense far below that of any other type of roof covering.

You can use Amatite for every kind of steep roofed building. We supply galvanized nails and liquid cement for the laps free of charge.

Send for free sample and booklet. Address our nearest office.

The Paterson Manufacturing Company, Limited, Montreal, Toronto, Winnipeg, Vancouver, St. John, N.B., Halifax, N.S.

REAL ROCK DRILL ECONOMY

Logically the true Standard of Rock Drill economy is based on the footage of holes drilled: not on a basis of time—regardless of work done.

It is obvious that the most economical drill is the one which will drill the greatest footage, per shift, the cheapest. Not the drill that runs the cheapest and does the least work.

Rand "Little Giant" Drills strike a powerful swinging blow, which has a most effective penetrating force.

The design of "Little Giant" Drills has remained practically unchanged for years, but improvements in construction have followed one another in rapid succession, always increasing the sturdiness of the drill, and keeping it to the front.

"Little Giants" insure the cheapest footage!

The Matter of Price

In buying mining equipment is one of the many reasons why we sell so much Screenings, Wire Rope, etc., in the various mining regions of Canada. Quality considered, you cannot secure prices any lower than are quoted by us on all

Greening's Mining Screens

We are operating the oldest Wire Drawing, Wire Weaving, Wire Rope making and Metal Perforating plant in Canada. Our equipment is so complete, our facilities so well organized, our output so large that we can quote prices on quality goods that mean a real saving both on the purchase price and on the length of service our goods give to their buyers. Let us quote you.

Why the C.P.R. North Toronto Route to Ottawa and Montreal is the Logical One

The train leaves as follows:

Leave North Parkdale - - -	9.15 p.m.	Leave West Toronto - - - -	9.30 p.m.
Arrive North Toronto - - -	9.40 p.m.	Leave North Toronto - - -	10.00 p.m.
Arrive Ottawa, 6.50 a.m.		Arrive Montreal, 7.00 a.m.	

Daily except Sunday.

¶ The residents of Toronto are adjacent to either North Parkdale, West Toronto or North Toronto stations, same being easily accessible and closer to residential districts.

¶ The North Toronto route is over an hour faster and overcomes a long hill climb for the train obviating any inconvenience and ensuring early arrival at Montreal and Ottawa.

¶ The roadbed has been improved till it is unexcelled in Canada. Practically half the line is double tracked.

¶ The equipment is "Canadian Pacific Standard," a synonym for the "best" and attentive porters, non-obsequious, ensure efficient service.

138 Washington Street, Chicago, U.S.A.

MILLING AND MINING MACHINERY

Shafting, Pulleys, Gearing, Hangers, Boilers, Engines, and Steam Pumps, Chilled Car Wheels and Car Castings, Brass and Iron Castings of every description, Light and Heavy Forgings.

Alex. Fleck Ltd. - Ottawa

Genuine Satisfaction

If you have anything to do with Rock Drills, you have, probably, been disgusted with them many times and wished you were running by hand. You are striving for fewer delays, lower mining costs, increased tonnage, and increased profits, and cannot afford to leave anything untried which would aid in the attainment of the above.

Can you afford therefore to pass by

THE

"Cleveland" Stope Drill

and not give it a trial when we can guarantee that it will relieve you of this part of your troubles.

There are so many reasons "why" that we haven't space enough here to enumerate them, but will you please

THE MINERAL PRODUCTION OF CANADA.

Most gratifying are the official statistics of Canada's mineral production for 1910. The Preliminary Report, prepared by Mr. John McLeish, Statistician of the Mines Branch, Ottawa, appeared early in March. The revised figures for the year 1909 show a total value of $91,831,441, or $12.82 per capita. The total for 1910 is $105,040,958, or $14.02 per capita. An increase of $13,209,517, or more than 14 per cent., is certainly substantial.

Accepting Mr. McLeish's basis of valuation, we find that Ontario now produces 40.95 per cent. in value of the entire mineral output of the Dominion. British Columbia comes second with 23.37 per cent., and Nova Scotia third with 13.38 per cent. Each of the other provinces contributes less than 10 per cent.

In the list of mineral products, coal shows by far the greatest expansion during 1910, the output for the year being valued at $29,811,750, which is greater by $5,030,514 than the figures reported for the previous year. The next largest leap is in silver. Of this metal $17,106,604 worth was produced in 1910, which exceeds the returns for 1909 by $2,928,100. Nickel production has been augmented by $1,719,433; pig iron, $1,663,766; clay products, $1,149,190; cement, $1,068,513; and gold, $842,680. For products, such as copper, asbestos, stone, gypsum, etc., increases of less than half-a-million dollars are recorded.

The most marked falling off is in the subsidized lead industry. Here a drop of $455,107 is announced. As British Columbia produces all the lead credited to the Dominion, the direct cause of the curtailment was the destructive Slocan forest fires. The only other serious recession was in the output of petroleum. Here again the causes were beyond human control. The oil-fields of Ontario are gradually being exhausted. The 1910 production was less in value by $171,054 than that of 1909. Two other commodities, salt and lime, show very slight drops in value. With these exceptions every mineral product shows gains for 1910. And every province, with the exception of New Brunswick, has augmented its annual production. In fact, nearly every province has had a "record" year.

It is hardly necessary to state that the outlook for the current year is even more cheerful. British Columbia's smelters, mines, and collieries are in better condition than ever. Her smelters are being enlarged, and there is good reason to believe that large iron and steel industries will soon be established on the Pacific coast. Few countries possess such a superabundance of iron ore, fuel, and flux on or near tide-water. All the essentials are there except the initiative of the organizer.

The collieries of Alberta and, in less degree, those of Saskatchewan, will be more active this summer. Manitoba is taking her clay industries more seriously. Ontario expects the first fruits of Porcupine. Gold bars should be not infrequent exports from that camp. Quebec's asbestos industry is shaping up better than could have been hoped a year ago. Her copper industry, also, has been revived. New Brunswick is cheered by the development of an encouraging gas- and oil-field. Nova Scotia's coal outputs are growing steadily. Soon tungsten-ore will be on her regular list of mineral products. Her gypsum trade is waxing. Lastly, there is every prospect of a marked increase in the gold yield of the Yukon.

From almost all aspects, the year 1911 should exceed 1910 by more than 1910 exceeded the preceding year.

THE THIRTEENTH ANNUAL MEETING OF THE CANADIAN MINING INSTITUTE.

The Annual Meeting of the Institute on March 1st, 2nd, and 3rd, at the Chateau Frontenac, Quebec, was undoubtedly pleasant and profitable. It is true that the sessions lacked the piquancy of some previous occasions when the results of hard-fought elections were about to be announced. But ploughshares are more to be desired than poniards. Yet a row is an excellent vent for our spleen. Lacking this vent, we must fall foul of somebody. Hence we have resolved to give some good advice to those who guide the affairs of the Institute.

First, however, we must express our keen sense of the hospitality extended to the delegates by Quebec. Not only was the street-car service placed at our disposal, but all delegates were given the freedom of the Garrison Club. These, and other courtesies, helped decidedly to make every one feel thoroughly at home. But best of all, was the warm greeting vouchsafed by the Quebec Government through the Hon. Mr. C. R. Devlin. That gentleman warmed the cockles of our heart by the unmistakeable glow that marked his welcoming speech. We shall not easily forget either his Celtic exuberance, his Gallic vivacity, or his Canadian shrewdness.

One fact, which should be appreciated by all members, is that we owe a debt of gratitude to the United States visitors who so regularly attend the meetings. To these gentlemen much of the success of every annual convention is to be credited. Not only would their absence rob the regular sessions of a great deal of interest, but the smoker and the dinner would suffer immeasurably. To them, then, we tender our sincere thanks.

We return now to our self-assumed task of offensive criticism. In the first place, a well-organized reception committee is an absolute necessity. At present far too much falls upon the shoulders of the Secretary. It is, naturally, impossible for one person to see that everybody is properly bestowed. Hence arise many annoyances. An active committee of half-a-dozen members could readily smooth the troubled waters. Moreover, there is little effort made to welcome the younger members and to introduce them to their seniors. This is a serious omission, an omission that should not be apparent next year. The suggested committee could best undertake this duty. If this is to be overlooked in the future, there will be grave danger of losing the interest of the younger generation.

Another point, one that hardly assumes the dimensions of a grievance, but one that is a source of some discontent, is the arrangement of the papers. Here, of course, the Secretary has our sympathy. The list of papers is always impossibly long. Until the actual time for reading arrives it is not possible to know of a certainty if the author is or is not to be present. Often also, the person presenting a paper takes up an indecent amount of time, and so dislocates the programme. But these are not insuperable obstacles. We believe that in the main, the programme can be so arranged as to make almost literal adherence to it quite feasible. Long papers are anathema. They should be read by title or, at worst, presented synoptically. The salient and debatable points of any paper can be outlined in a very short time. No one speaker should be permitted to occupy the floor for more than half-an-hour. Discussions should be pointed, apposite, and brief. The chairman should be able to call anyone to order without giving offence. In fact, he might well seize such opportunities as occasions for adding to the humour of the meeting. In any case, we need far better control of our meetings. Energy, time, and patience are wasted as matters now stand.

Again, there is room for criticism of the nature of the papers read. The greater number of these treat of pure geology, or are entirely academic. The fault here lies with the mining men themselves primarily, and secondarily, with the officials of the Institute. But apart from distributing the blame, it is to be remembered that the mining man, per se, is not interested in remote geological problems. He is keenly interested in practical work. And his attention can be held only by papers and discussions that overlap his own experience. Even if stated papers on practical mining are not presented, time should be reserved for dealing with professional mining topics.

These philippics are sufficient to indicate the view of the submerged three-quarters of the Institute. We all hope to make our society mean more and more. We are justly proud of its prominence and activity. But the time has come when younger members should be given a larger share in the proceedings.

One final suggestion remains. There is no adequate reason for holding the annual meetings in March. The summer months would be much more suitable. Short excursions before and after the sessions would thus be made possible. Travelling would be easier, and the attendance larger. In fact, a change of this kind would be most acceptable. One incidental advantage would be the facility with which torrid geological disputes could be settled out of doors.

NOVA SCOTIA'S MINERAL PRODUCTION.

The Report of the Nova Scotia Department of Mines or the year ended September 30, 1910, has reached s just as we are going to press. In our April 1st is- ue we shall give this report the usual extended notice. ust now we can notice only the leading features.

The number of tons (gross) of coal raised was 5,- 77,146. Shipments amounted to 4,896,896 tons, of hich amount the St. Lawrence trade took 1,786,948 ns, and Nova Scotia itself, 1,806,999 tons. Of this st amount, 442,764 tons were consumed at the col- eries. We note that the output per man employed as gone up to 500 tons per year, as against 430 tons uring the previous year.

Gold mining did not hold its own during 1910. The roduction amounted to 10,675 ounces, a slight falling ff as compared with 1909. The average yield per n of ore was $4.09. This figure is, of course, a very ough approximation. The decline in gold mining is fficially attributed to "insufficient capital, scarcity of ood labour, past wildcatting, unintelligent direction f operations, [high] cost of fuel, and lack of pros- ecting." It is to be noted that, whilst this diagnosis sufficiently comprehensive, each and every ailment entioned is remediable.

The only locality at which iron ore is being pro- uced is Torbrook. Here the Canada Iron Corporation ined 52,640 short tons during 1910. Of this quantity out 11,000 tons were shipped to the United States nd to Scotland. Large shipments are to be made this ear. It is possible, also, that ore may be produced at risaig, Antigonish County.

Manganese and tin have not yet emerged from the rospect stage. The mining of scheelite, however, is eing actively pushed at Moose River, Halifax County. shipment of 75 tons of high grade ore was made dur- g the year, and much larger quantities will be sold uring the current year.

Although the Province's gypsum quarries yielded 2,974 tons of that mineral, only 10,50 tons were util- ed by local manufacturers. The remainder was ipped crude to the United States. We believe that the preparation and marketing of finished gypsum oducts, on a suitable scale, there should be consider- le profit. The report draws attention specifically this.

The brick and clay industries have not expanded, nd the building stone trade has diminished to a few ousand tons.

The total impression that remains after glancing rough the report is that Nova Scotia is about as adly in need of prospecting and exploitation as any untry can be.

A BREEZE FROM THE NORTH.

About five hundred men interested in the Elk Lake- owganda districts, which are situated in the Montreal iver Mining Division of Ontario, recently waited on the Government asking that the Charlton Branch of the Temiskaming & Northern Ontario Railway be extended to Elk Lake and Gowganda in order to provide economical transportation to facilitate development work and mining operation in the districts mentioned.

An organization meeting was held on the 14th instant at which a good deal of steam was let off and speakers chosen to present the case to the Government. The deputation was introduced by Mr. R. Shillington, M.L.A., and received by the Honourable Frank Cochrane, Minister of Mines and Forests, and a number of his colleagues.

Many arguments were put forward to prove that the extension of the Government railroad should be made in the interests of mining, lumbering, and farming, and there was evidence of earnestness and feeling in the language of the speakers.

During the progress of the meeting, Premier Sir James P. Whitney honoured it with his presence for a few minutes, repeated the platitudes with which delegations are so familiar, and retired.

The Minister of Mines candidly told the delegation that the policy of the Government was to protect its timber resources in the Temagami Forest Reserve rather than to encourage further encroachment by prospectors, miners, or railroads. He deplored the serious losses that the forest reserve had suffered through fire during the past few years, implying that those engaged in prospecting and mining were responsible. This is a matter of opinion, but no effort was made to controvert it at the meeting. Whilst the Minister's attitude may be commendable, at this late day it is hardly fair to men engaged in the mining industry, when they are seeking to redeem investments already made.

Whether the Province has benefitted financially or not by the sale of mining locations in the sections referred to, the men who have paid the Government for mining locations should meet with its fullest support in their efforts to reap where they have sown. Had the Government closed the Temagami Forest Reserve against prospecting and mining, as they did the Gillies Timber Limit, the present unfortunate situation would not have arisen. It is useless to talk of locking the stable door when the key has been lost.

After reviewing the arguments which had been made by the various speakers, Mr. Cochrane took the position that the claims put forward as to the probable tonnage of ore, pulpwood, and other products that might be produced and shipped from the district, should be investigated and reported upon to the Government before a decision could be reached.

A committee was thereupon appointed at his suggestion, representing the Government, the Temiskaming & Northern Ontario Railroad, and the miners, to carry out the investigation, and the Minister promised that an immediate decision would be given on receipt of its report.

If, as Mr. Cochrane, stated, the Government's answer depends on a question of tonnage, the miners should carry the day. All other considerations being equal (and there is no doubt that there will be more pulpwood and other timber products brought out from the Temagami Forest Reserve than from the Porcupine district) the tonnage of silver-bearing ores which is already being mined and shipped, even under the existing adverse conditions, is infinitely greater than any tonnage of ore that can ever be expected to come out over the new branch line being built by the Government into the Porcupine district. The Porcupine gold ores will be treated in stamp-mills and cyanide plants on the ground, only the resultant product being shipped in the form of gold bars. These will be taken care of through the banks, or brought out in smug suitcases when the successful operators desire reasonable excuses for making periodical trips to civilization. But the receipts of the T. & N. O. will not be greatly enhanced thereby.

EDITORIAL NOTES.

The Hon. Christopher Chisholm, Commissioner of Works and Mines, recently introduced a bill in the Provincial Legislature of Nova Scotia, providing for the compulsory use of locked safety lamps in all the collieries of the province. Certain clauses are added permitting the use of electric lights when approved by the proper authorities. An expression of opinion is to be obtained from the miners of the province.

Diamond drilling was conducted under the auspices of the Nova Scotia Department of Mines, during 1910, at an average cost of $0.93 per foot. Boring by Calyx drill cost on an average $1.44 per foot. The Calyx cores were of 6-inch diameter, the diamond cores from 15-16-inch to 2-inch.

Supplementing our editorial notice of the three lea ing corporations that have invested in Porcupine, may be noted that the firm of Bewick, Moreing & Co pany, which has undertaken the development of ce tain claims in Porcupine, has offices in London, Me bourne, and Kalgoorlie. The firm manages the affai of thirty Australasian and African mining companie

There appears to be no immediate prospect of re dering uniform the statistical methods employed by th Dominion Mines Branch and by the various Provinci Bureaus. Until uniformity is secured there will be en less confusion and duplication.

The Canadian correspondent of the Mining Journ (London, Eng.), in a letter that appears in the Febr ary 11th issue of our contemporary, makes a seriou blunder. In writing of the New Brunswick gas- an oil-fields, which are being developed privately by D J. A. L. Henderson, of London, the correspondent co founds these operations with those of the Maritim Gas and Oil Company, a Nova Scotian concern cap talized at $5,000,000. Dr. Henderson's company is Mar time Oilfields, Ltd., and is, as stated above, compose entirely of private subscribers, who have no intentio of asking anybody for money until the field is prove

The Consolidated Gold Fields of South Africa, Ltd is the corporation that has acquired a large interest i the Rae mine, Porcupine. At a shareholders' meetin in London, on February 22nd, Lord Harris, the chai man, explained the need of the proposed new issue second preference shares. In addition to the Porcupi venture, new enterprises are being undertaken in th United States, Mexico, and Rhodesia. Although th new issue has not found favour with all the shareho ers, the majority have raised no objections.

CANADIAN MINING INSTITUTE, THIRTEENTH ANNUAL MEETING — Held at the Chateau Frontenac, Quebec, Que., March 1st, 2nd and 3rd, 1911.

Early on Tuesday, Feb. 28th, there were signs of activity in the Chateau Frontenac. Several of the councillors, and a sprinkling of other members, had already arrived. But the bulk of the delegates drifted in on Wednesday and Thursday.

The total attendance was large, aggregating about 200. Cobalt, Toronto, Montreal, and Eastern Quebec were heavily represented. The delegation from the United States was exceptionally large. But only one Nova Scotian, and not one Albertan or British Columbian appeared on the scene. Distance is, of course, an adequate excuse for the Westerners; but the lack of maritime mining men is regrettable. More especially is this the case in view of the fact that Ontario and the Dominion are always represented at the meetings of the Mining Society of Nova Scotia.

Wednesday Morning Session.

In the unavoidable absence of the Premier, S Lomer Gouin, the convention was formally opened b the Hon. C. R. Devlin, Minister of Mines, Quebec. M Devlin, in the course of an exceedingly witty and chee ful speech, referred to the good work done by the Ch bougamou Commission. He announced that three ne expeditions would be sent out during the coming sun mer. Another interesting announcement was to th effect that the Quebec grant to the Institute is soon t be increased. Mr. Devlin's speech was received wit hearty applause.

The President, Dr. F. D. Adams, now followed wit a survey of progress made during the past year. H predicted great things for the Province of Quebec, an warmly congratulated the local Government on posses

ng two such officials as the Hon. Mr. Devlin and Mr. Theo. Denis, the present Superintendent of Mines. Alluding to the proposed Canadian meeting of the International Geological Congress in 1913, Dr. Adams urged that all mining men do their utmost to help in making that convention a monumental success.

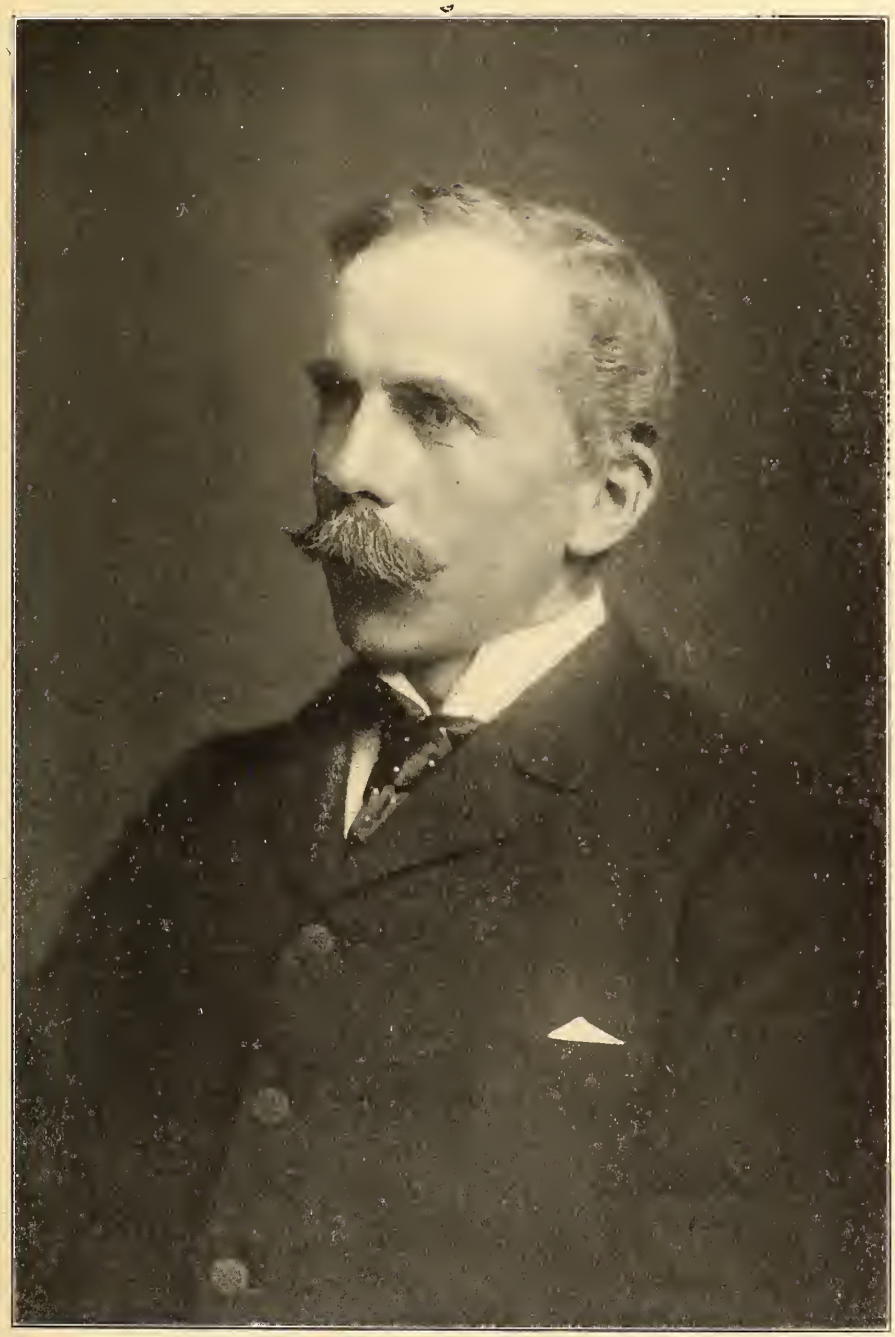
Mr. J. McLeish, Statistician of the Mines Branch, Ottawa, then presented the official figures of mineral production for the Dominion for 1910. These will be found on another page of this issue. Mr. Theo. Denis followed with the 1910 statistics for Quebec, and Mr. T. W. Gibson with those for Ontario. In the absence of Mr. Hiram Donkin, Deputy Commissioner of Mines for Nova Scotia, Mr. H Mortimer-Lamb read a brief statement of the mineral output of Nova Scotia. Mr. Lamb also referred to the mineral statistics of British Columbia, Alberta, Saskatchewan, and New Brunswick, which appear in the last bulletin of the Institute, copies of which were distributed amongst the audience.

Announcement was then made of the results of the election of officers. They are as follows

President, Dr. F. D. Adams.

Vice-Presidents, Dr. A E. Barlow, Mr. Thos. Cantley.

Councillors:—Dr. J. Austen Bancroft, Mr. R. W. Brock, Mr. A. A. Cole, Mr. E. T. Corkill, Mr. Theo. Denis, Mr. John Donnelly, Mr. E. Dulieux, Mr. F. W. Gray, Mr. G. F. Silvester, Mr. J. B. Tyrrell.



President, F. D. Adams,

At this point Col. A. M. Hay rose to move a resolution expressing the Institute's approval of the work of the Conservation Commission. He was seconded by Mr. J. B. Tyrrell. The motion was unanimously carried, and the Secretary was instructed to send a copy of the resolution to the Hon. Mr. Sifton, Chairman of the Commission.

The reading of papers by Mr. Denis, Mr. L. Reinecke, and Mr. H. Mortimer-Lamb, brought the morning

session to a close. These papers were, respectively, "Mining Rights on Quebec Seignories," "The Ore Deposits of the Beaverdell, West Fork of Kettle River, B.C., and "Photography for Mining Engineers and Geologists." The last paper aroused an animated discussion. Certain facts were brought out that would have provided fine material for a representative of the Lord's Day Alliance. After the smoke had cleared away, the situation resolved itself into a battle between the advocates of films and the supporters of plates. Victory perched on the banners of the latter, until the Duke of Abruzzi was called in as a special "film" reserve. It was "lunch or Abruzzi." "Films" had the last word.

Wednesday Afternoon.

No regular session was held on Wednesday afternoon. Many of the members availed themselves of the kindness of the Quebec Electric Railway Company, and visited Montmorency Falls.

Wednesday Evening Session.

The evening was opened by the presentation of one of the most instructive papers ever read before the Institute: "The Engineering Problems of Geological Nature Afforded by the New Catskill Aqueduct of New York City," by Dr. J. F Kemp, Columbia University, New York. Dr. Kemp traced the position of New York's present inadequate water supply from the Croton reservoir, and showed, by means of lantern slides, how the new supply is to be brought from the Catskill Mountains. The enterprise involves the expenditure of many million dollars. From Dr. Kemp's lucid explanations it was evident that he and his staff had been able to save the contractors a considerable percentage in advising through what formations to carry the aqueduct. This successful application of geology to a huge engineering problem is unique. It carries a lesson that may well be taken to heart by Canadian cities. New York not only has saved money, but has very considerably hastened the completion of the tremendous Catskill aqueduct by acting on the advice of qualified geologists.

The second paper of the evening was read by Dr. Barlow. It was entitled "The Economic Geology of the Chibongamou region. Numerous lantern slides illustrative account of his last summer's exploration of the Chibougamou region. Numerous lantern slides lilustrated the lecture. The speaker emphasized strongly the fact that the Commission, of which he was chairman, did NOT damn Chibougamou. The region has possibilities. But these possibilities are yet unproved. There is little ground for the exaggerated reports that heretofore have been circulated. At one point the audience was electrified by the speaker's statement that he lacked the damnatory language anyway. This assertion was modified later.

Thursday Morning Session.

The first paper read at this session was Prof. C. H. Richardson's "Asbestos Desposits of the New England States." This was interestingly discussed by Messrs. Cirkel, Barlow, Dresser, Nason, and Penhale. The last speaker referred to the fact that in manufacturing Russian asbestos fully two-thirds the quantity of Canadian asbestos was mixed with it to bring it up to the desired quality.

Other papers on asbestos were read by Dr. J. A. Dresser, and by Mr. Edward Torrey.

Thursday Afternoon Session.

Dr. A. C. Lane's paper, "The Copper Deposits of the Keeweenaw Peninsula, compared with Similar Canadian Deposits." Then followed papers by Dr. Davi T. Day and Mr. Eugene Coste on the subject of petrole um. These led to a picturesque encounter between th two doughty champions. Had time permitted, ther might have ensued a struggle that would have effaced both. But the President intervened. A paper by Mr D. B. Dowling, "The Undeveloped Coal Resources o Canada," was the last read.

Thursday Evening—The Smoker.

At 9 p.m. most of the visitors had gathered in th capacious tea-room of the Chateau. The usual songs geological and mining vaudeville, and impromptus were rendered. But the event of the even ing was the sensational arrest, trial, an conviction of a prominent Ontario geologis for unconventional behaviour in Sweden. So over whelming was the evidence adduced by the prosecu tion that the accused never stood the remotest chanc of clearing his skirts. One of these latter was on th scene. The tragic tale unfolded by Prosecuting-Attor ney LeRoy brought tears to the eyes of the case-hard ened jury, and perceptiby heightened the colour i Justice Penhale's super-dignified countenance. Twic or thrice in attempting to defend his client's conduc the Attorney for the Defence, Dr. A. R. Ledoux, brok down completely. Indeed the whole audience gave fre vent to wave after wave of emotion throughout th trial. The consistent narrative of Dr. Kemp-Coo carried much weight in convicting the prisoner. contributory cause was the sullen silence of the a cused. The sentenee, though heavy, was just. Som little confusion arose as to the allocation of the fin But this was amicably settled when Justice Penha generously consented to accept a large share of it hin self.

Friday Sessions.

During these sessions, several papers were presente Amongst them were the following: "Quebec Eartl quakes," by Dr. James Douglas; "The Porcupir Gold Area," by Mr. A. G. Burrows; "The Iron O Resources of the World," by Dr. Frank D. Adam "The Wabana Iron Mines of the Nova Scotia Steel Coal Company, Limited," by Thos. Cantley; "Th Clays of Western Canada," by Dr. Heinrich Ries "Some Suggestive Phases of the Iron Mining Indu try of Eastern North America," by Mr. Frank Nason; and "Recent Underground Development Wor at Cobalt," by Mr. C. W. Knight, and "Notes on th Iron Ores of the Metagami River," by Prof. M. Baker.

Mr. Knight's paper was illustrated by slides of u derground photographs taken by Mr. A. A. Cole.

During the afternoon session Mr. Rice, of the Unite States Bureau of Mines, gave a very interesting talk c the work of the Pittsburgh Testing Station. Mr. W. Ingalls led the discussion that followed.

The Dinner—Friday Evening.

The attendance at the annual banquet was larg than usual. Dr. F. D. Adams was chairman. Amon the speakers were the Hon. C. R. Devlin, Mr. F. Con don, M.P., Dr. James Douglas, Dr. A. C. Lane, Dr. F. Kemp, Col. A. M. Hay, Col. Turnbull, Prof. C. Richardson, Dr. W. G. Miller, Mr. F. L. Garrison, M Eugene B. Wilson, and Mr. J. C. Murray.

The menu card, presented by the Asbestos Manufa turing Company, was a tablet of prepared asbestos.

The toast list was commendably short. It was r grettable, however, that several of the United Stat visitors, including Dr. A. R. Ledoux and Mr. W.

Ingalls, were forced to leave on an early train before the dinner was nearly over.

In a broad sense the Quebec meeting was a success. In our editorial columns we draw attention to some details that need attention. But we must not close this correspondence without alluding to the splendid spirit in which the Quebec officials welcomed the delegates.

SOCIETY OF CHEMICAL INDUSTRY.

(Special Correspondence.)

The first joint meeting of the Canadian sections of the above society was held on Friday, Feb. 24th, in the School of Mining, Kingston. The members of the Toronto section travelled in a chartered Pullman to Kingston, where they were joined by representatives from Ottawa and Montreal.

The visiting members were the guests of the School of Mining, and, during the afternoon preceding the meeting, were entertained by the professors of the School. Visits were paid to old Fort Henry, Royal Military College and other points of interest in and about the historic city.

At 6.30 dinner was served in the Red Room of the new Arts Building, at the conclusion of which Dr. Goodwin, on behalf of the School of Mining and the Kingston members of the Society, welcomed the visitors in a felicitous speech. He expressed the desire that this first joint meeting in Kingston would prove to be but the beginning of many similar gatherings. Prof. Lash Miller replied for the different sections represented, and thanked the hosts of the evening for the excellent entertainment provided.

Mr. Alfred Burton, honorary secretary of the Toronto section, read the minutes of the last meetings held in Toronto and Montreal, and letters were read from Messrs. Joel B. Saxe, Wm. Lowrie, Brainerd, and Murray Wilson, regretting their inability to be present.

The paper on "The Use of Permitted Explosives," by Mr. C. J. Coll, Stellarton, N.S., was read in his absence by Dr. Goodwin. As all papers read before the different sections are the property of the parent society until published in their journal, it is not permissible here to report the papers in full.

Mr. Coll, who has had many years' experience in the coal regions of Nova Scotia, traced the change in sentiment of the mine managers regarding explosives from the year 1841, when the use of black powder was universal, to the present day. At present none but explosives on the permitted list in Great Britain are used. Mr. Coll's experience went to prove that explosives, the permitted list in Great Britain, but manufactured in Canada, were not so satisfactory. The reason for this is not apparent; nevertheless the imported article is best. A table was submitted comparing black powder and permitted explosives as to cost and amount used per ton of coal broken, an average for four years being taken for the comparison.

It was found that 28 per cent. more pounds of black powder were used to break a ton of coal, at one and one-half times the cost. The miner working on contract and purchasing his explosives from the company saves 6 cents per day by using the permitted explosive.

Mr. Coll's paper closed with an earnest appeal for better and safer systems of manufacturing, and a closer conformity to the standards required in Great Britain.

Dr. Guttman, Associate Professor of Chemistry at the School of Mining, read a paper on the "Manufacture of Explosives." Dr. Guttman has had a long connection in different countries with the explosives industry, and is thoroughly conversant with every branch of the business, from the designing of the plants for its manufacture to the proper distribution and use of the finished product. In this industry he had the decided advantage of his father's tuition, during his life a leading authority on the Continent on all branches of the explosives industry. Dr. Guttman's paper was largely descriptive of the latest devices and methods used in different places for nitrating the glycerine and testing the product.

His remarks were illustrated by lantern slides of the various plants and machinery in use. Several slides depicted graphically the disastrous results of the frequent explosions which take place in the factories. Dr. Guttman mentioned the fact that on the Continent, gelignite and explosives of that nature were used almost exclusively. In Canada and the United States, dynamite has the largest use, but the increasing cost and scarcity of glycerine will ultimately necessitate the use of more ammonium nitrate compounds. The world's total visible supply of glycerine for the next two years is already under contract for purchase. A comparison was made between dynamite and the ammonium nitrate and starch compounds, as to cost and effectiveness.

Dr. Guttman closed an exceedingly interesting and instructive paper by describing in detail, with illustrations, the construction of an ideal building for the manufacture of explosives.

Mr. E. W. Monk, of the Hamilton Powder Company, Montreal, read a paper on "The Care, Handling, and Use of Explosives." Mr. Monk is probably the best authority on this subject in Canada. Most of his life has been spent in the practical use of all makes and brands of explosives, and he speaks with the knowledge that comes only from experience. What Mr. Monk doesn't know about powder isn't written in the books, or learned in the factory, and still he says himself that when loading holes he is very careful to watch the men beside him, for fear the fool-killer has missed a man or two. This is a good thing for some miners to remember, especially those who think they know all about explosives. Mr. Monk at the very out set of his address wished it distinctly understood that he was relating his own experiences only and expressing in the paper his personal opinions. He described the ideal explosive and divided all accidents into two classes:—

1. Direct. 2. Indirect.

In the first class he placed all accidents due directly to carelessness. These include 95 per cent. of the total. Mr. Monk mentioned the fact that accidents in British Columbia, among the Chinese labourers, were reduced to a minimum, simply because the wily Chinaman does exactly as he is told, no more and no less.

The effects of the gases from intro-glycerine explosions, on the human system, were explained, and the best methods of resuscitation and treatment described.

Different methods of thawing dynamite, which had come under the writer's notice, were outlined, and some of them certainly exhibited the maximum of foolhardiness and ignorance—thawing the cartridges in boiling water, leaving the nitro-glycerine in the shack and loading the holes with water soaked sawdust, was one method ridiculed.

The latter part of Mr Monk's paper described in detail, with the aid of lantern slides, the use of gelignite in the Crean Hill shaft of the Canadian Copper Company. This is a four-compartment incline shaft

8-ft. x 24-ft, with a dip of 67 degrees from the vertical. slides were exhibited showing position of the holes giving best breaking results.

In the discussion which followed the reading of the different papers, Capt. Sedgwick, of the Royal Military College, described the uses of explosives as propellants. The captain is a pleasing speaker. He expressed the opinion that the danger from the use of aeroplanes in war operations is not very great.

Prof. Manley Baker described a visit to the United States Government testing plant for explosives at Pittsburgh, Pennsylvania. The professor showed by blackboard diagrams that black powder is far more dangerous in coal mines than the permitted explosives.

Dr. Milton Hersey, of Montreal, gave some interesting figures as to cost and methods of manufacturing explosives, and suggested that there is a good field in Canada for a nitro-starch plant.

Dr. Ellis, of Toronto University, was in a reminiscent mood, and quoted from a letter to the London Times of many years ago, written by the famous Nobel anent the carelessness exhibited in the handling of explosives. He related one incident where a poor unfortunate greased his waggon with nitro-glycerine, and, strange to say, it ran along smoothly until the wheel struck a boulder, and then kind neighbours wrote his epitaph. This was on a par with the fellow who filled his lamp with the same substance in lieu of coal-oil.

Prof. Lash Miller, on behalf of the officers of the Society, tendered a hearty vote of thanks to all those who had read papers and had taken part in the interesting discussion that followed.

The Kingston meeting was one of the most instructive and interesting that the Society has ever held. In numerical attendance, in the quality of the papers read, and in sustained interest, it surpassed any of the preceding meetings.

Present at the meeting were: Dr. Goodwin, Eugene Haanel, Dean Dupuis, Dr. Guttman, M. F. Connor, Prof. McPhail, R. Harcourt, B. L. Emslie, Prof. Bain, J. A. DeCew, Dr. Milton Hersey, H. H. Miller, N. F. Kalmus, Prof. W. P. Cohoe, J. A. King, C. R. Stauffer, C. W. Drury, John Donnelley, W. O. Walker, F. W. Babington, Dr. Waddell, Geo. T. Richardson, R. J. Manning, A. Neigbhorn, N. C. Polson, Douglas Ellis, John Robertson, Walter D. Bonnur, E. B. Henderson, Prof. Gwillim, Dr. D. B. Dowling, A. McGill, Prof. Lash Miller, Prof. W. H. Ellis, Alfred Burton, Prof. M. Baker, G W. McNaughton, Prof. Kirkpatrick, E. W. Monk, B. Blackhall, J. G. S. Hudson, Geo. Y. Chown, Percy D. Lyman, S. N. Graham, F. G. Stevens, J. A. McRae, R. C. Hammond, R. T. Mohan, J. H. Barrett, E. A. Collins.

PERSONAL AND GENERAL

Mr. P. Kirkegaard has built an office and dwelling in South Porcupine and will in future devote considerable time to private practice in this district.

While returning from the Quebec meeting of the Canadian Mining Institute, Mr. G. H. Gillespie was seriously injured near Madoc, Ont. He is now making substantial progress, but will be confined to the house for some weeks.

Mr. J. McEvoy has just completed a series of lectures on coal-mining before the fourth year mining students of Toronto University. Much appreciation has been expressed by the students. It is hoped that this feature may be incorporated permanently in the mining course.

Mr. Edward W. Parker, of Washington, D.C., statistician in charge, Division of Mineral Resources, U. S Geological Survey, attended the meeting of the Western Branch of the Canadian Mining Institute at Nanaimo, B.C., on February 16.

Mr. Samuel S. Fowler, of Nelson, B.C., paid a business visit to New York last month.

Mr. Howard W. DuBois, of Philadelphia, engineer in charge of the water supply system the Quesnelle Hydraulic Gold Mining Company is constructing, to bring water from Swift River to its gold gravel leases near Quesnel River, Cariboo district, B.C., was in Victoria lately, on his way to Quesnel.

Mr. J. Edgar McAllister, of Greenwood, Boundary district, B.C., general manager of the British Columbia Copper Company, was in New York last month, in connection with the company's annual meeting of shareholders.

Mr. W. J. Elmendorf, manager of the Portland Canal Mining Company, was in Victoria recently, conferring with the directors of the company relative to its mining and concentrating operations at Glacier Creek, Portland Canal mining division, B.C.

Mr. J. L. Parker, of Victoria, B.C., has been examining mining properties at Sheep Creek, in the Nelson mining division.

Mr. F. J. Longworth, of the British Columbia Copper Company's staff, for some time at Greenwood, B.C., is now superintendent of the company's Napoleon mine near Boyds, Washington, U.S.A.

Mr. Wayne Darlington, of Boise, Idaho, has been investigating lode mining conditions in parts of British Columbia, for United States clients.

Mr. Walter H. Aldridge and family left Trail, B.C. on February 22, for Los Angeles, California, where their home will be in future.

Mr. T. H. Kerruish, formerly superintendent at the Copper King mine, near Whitehorse, Southern Yukon, has been spending part of the winter in Victoria and Vancouver, B.C.

Mr. Geo. H Aylard, for six years in charge of the development of the Standard silver-lead mine, near Silverton, Slocan, B.C., has removed, with his family to Victoria for a three months' change.

Dr. J. M. Bell, after occupying the position of Director of the New Zealand Geological Survey since February, 1905, has tendered his resignation. Dr. Bell's work in New Zealand has been most effective. Not only has the survey been reorganized in an administrative sense but numerous important geological reconnaissances have been begun and completed. Dr. Bell will return to England, visiting New Caledonia and Westralia *en route*. Early in August he will visit Canada. He intends to take up private practice in London and Canada.

A press correspondent, writing from Greenwood, B.C., claims that Archie Aberdeen, who is employed at Bergen, Meyer's Creek, Boundary district, where a small seam of coal is being developed, is the oldest working miner in that province. He was 80 years old last June.

A press despatch from Ottawa, dated February 1[illegible] was to the effect that the Honourable the Minister of Labour had received a message from the chairman of the Board of Conciliation and Investigation, stating that the difficulty betwen the Crow's Nest Pass Coal Company and its miners, involving the question of hours and wages, had been amicably adjusted through the offices of the board.

Abstract of Preliminary Report of the Mineral Production of Canada, 1910

(Statistics Subject to Revision.)

Prepared by John McLeish, B.A., Chief of Division of Mineral Resources and Statistics.

Although complete statistics are not yet available, sufficient information is at hand to indicate that the total value of the mineral production of Canada during the past year exceeded $105,000,000. This production is made up from such a great variety of well established mining industries that the record should be particularly gratifying not only to those who are directly interested in the development of the mineral resources of the country, but also the public at large who indirectly profit thereby.

Not only is the increase over the production of the previous year a large one, having amounted to $13,209,517, or over 14 per cent., but an examination of the details of production shows that the increase has been fairly well distributed amongst the more important ores and minerals produced in Canada.

The production of the more important metals and minerals is shown in the following tabulated statement, in which the figures are given for the two years, 1909 and 1910, in comparative form, and the increase or decrease in value shown. Tabulated statements for both years, in greater detail, will be found on subsequent pages of this pamphlet:

The subdivision of the mineral production in 1909 and 1910 by provinces was approximately as follows:

Province	1909	% of total	1910	% of total
Nova Scotia	$12,504,810	13.62	$14,054,534	13.38
New Brunswick	657,035	0.71	585,891	0.56
Quebec	7,086,265	7.72	8,193,275	7.80
Ontario	37,374,577	40.70	43,017,026	40.95
Manitoba	1,193,377	1.30	1,470,776	1.40
Saskatchewan	456,246	0.50	557,806	0.53
Alberta	6,047,447	6.58	7,876,458	7.50
British Columbia	22,479,006	24.48	24,547,817	23.37
Yukon	4,032,678	4.39	4,737,375	4.51
	$91,831,441	100.00	$105,040,958	100.00

It will be observed that there has been an increased production in nearly every province, the only falling off being shown by New Brunswick, in which the gypsum production, and some of the structural products, showed a slight decrease.

In Nova Scotia there was a largely increased production of coal and gypsum. In Quebec, the principal in-

creases were in cement and asbestos. Ontario's increases are principally in the metals copper, nickel, and silver.

Manitoba shows an increased production of gypsum and clay products; while in Alberta, clay products, cement, and particularly coal, contribute the chief gains. In British Columbia the increase is mainly due to the coal industry, while the Yukon not only shows a gratifying gain in gold production, but a growing shipment of copper and silver ores.

Of the total production in 1910, $49,169,826, or 46.8 per cent., is credited to the metals, and $55,871,132, or 53.2 per cent., to the non-metallic products. Amongst the individual products, coal still contributes the greatest value, constituting 28.4 per cent. of the total. Silver is next, with about 16.3 per cent.; nickel third, with 10.6 per cent.; gold, 9.7 per cent.; clay products, 7.2 per cent.; copper, 6.8 per cent., and cement, 6.1 per cent.

In valuing the metallic production, the same general practice has been followed as in past years, with one or two slight modifications. Instead of valuing lead at the New York price, the average price at Toronto has been used. This is somewhat lower than the New York price, but higher than that in London.

Nickel has been valued at an average price of 30 cents per pound, although the minimum quotation for the metal in large lots was 40 cents. Considerable quantities of monel metal are now made, the production of which does not require the separation of the nickel metal, and the price of 30 cents is equivalent to valuing two-thirds of the production at 37½ cents, and one-third at 15 cents.

Smelter Production.

General statistics of smelter production were collected by this branch for the first time in 1908, and the aggregate results of these operations during the years 1908 and 1909 are shown in the accompanying table. Unfortunately, complete returns have not yet been received for the year 1910. It should be explained also that the figures include the results of the treatment of a small quantity of imported ores. The results of the operations at the smelter at Northport, Wash., treating chiefly Canadian ores, have also been included:

The total ore charged to the furnaces during each of the past two years is shown as under:—

	1909	1910
Nickel-copper ores	462,336	628,947
Silver-cobalt-nickel-arsenic ores	8,384	9,466
Lead and other ores treated in lead furnaces	53,006	57,547
Copper-gold silver ores	1,850,889	*2,000,000
Total	2,374,615	2,695,960

*Returns incomplete but tonnage probably exceeded the figure given.

Gold.

While statistics of gold production are as yet incomplete, a preliminary estimate shows a production of approximately $10,224,910, an increase of about 9 per cent. over the 1909 production. The production of the Yukon is valued at $4,550,000, the total exports, on which royalty was paid during the calendar year according to the records of the Interior Department, being 275,472.51 ounces. The Yukon production in 1909 was $3,960,000, the exports being 239,766.35 ounces. The British Columbia production in 1909 was: placer gold, $477,000; bullion from free milling ores, $329,655; smelter recoveries, $4,367,924. In 1910 the placer production is estimated by the Provincial Mineralogist as $482,000. An estimate of free milling bullion shipments and smelter recoveries is made of $4,950,000, or a total production for the province of $5,432,000. The Nova Scotia production shows a falling off of about $20,000, while Ontario will probably show a slight increase on account of the gold recovered in development work at Porcupine, of which a record has not yet been received.

Silver.

The silver production of Canada in 1909 showed an increase of 24.5 per cent. over that of 1908, following a series of large increases during the three preceding years. It is very satisfactory, therefore, to be able to report a further increase in 1910 of about 16 per cent. The total production last year, including that produced as bullion and the metal estimated as recovered from ores sent to smelters or otherwise treated, was approximately 31,983,328 ounces, as compared with a production of 27,529,473 ounces in 1909.

The increase is again chiefly credited to Cobalt and adjacent mining districts of Ontario.

There was a slight falling off in the silver production of British Columbia as a result of the decreased production from the silver lead ores of the province.

For the Province of Ontario, complete returns have been received from all the larger operators, while estimates based on railway shipments have been made for two or three of the smaller mines. The net production of recoverable silver is estimated at 29,375,000 ounces, that is after deducting 5 per cent. from the settlement assays of ores to smelters to allow for smelting losses. At the average price of silver for the year this has a value of $15,711,513.

The production, similarly estimated, for 1909, was 24,822,99 ounces, thus showing an increase in 1910 of about 4,552,901 ounces, or over 18 per cent.

The total shipments of ore and concentrates were ounces of silver, in addition to which somewhat over 940,000 ounces were shipped as bullion. The average silver content of ore and concentrates shipped was thus about 865.57 ounces, or $462.96 per ton, as compared with an average of 840 ounces in 1909.

The shipments during 1909 were 27,835 tons of ore, containing 22,349,717 ounces of silver, or an average of 803 ounces per ton; 3,059 tons of concentrates containing 3,627,819 ounces, or an average of 1,186 ounces per ton, and bullion containing 143,440 fine ounces.

The exports of silver in ore, etc., as reported by the Customs Department, were 30,699,770 ounces, valued at $15,649,537.

The price of refined silver in New York varied between a minimum of 50½ cents per ounce on March 2nd, and a maximum of 56¾ cents on October 19th, the average monthly price being 53.486, as compared with an average monthly price of 51.503 cents in 1909.

Copper.

No refined copper is produced in Canada, but the copper ores are mostly reduced to a matte or blister copper carrying values in the precious metals. In Quebec, where the copper is recovered subsequently to the extraction of the sulphur from pyritic ores, there was increased activity during the year. A small quantity of ore was exported from British Columbia coast mines and the Yukon to United States smelters for treatment. In Ontario, where the copper is chiefly recovered from the nickel-copper ores of the Sudbury district, there is a very large increase in production. In British Columbia, the most important events during the year were the acquisition of a controlling interest in the Dominion Copper Company by the British Columbia Copper Company, with the subsequent re-opening of several of the big properties, and the destruction by fire of part of the head works of the Granby Mines at Phoenix, B.C., which noticeably affected the output, although the Boundary district as a whole shows an increased production.

Statistics are not available at the present time to show the total quantity of copper contained in ores shipped from the mines. The total production of copper, however, contained in blister and matte produced and estimated as recoverable from ores exported was in 1910 approximately 56,598,074 pounds. In 1909 the production of copper, estimated on the same basis, was 52,493,863 pounds, an increased production of about 7.8 per cent. being therefore shown in 1910.

Of the production in 1910, Quebec is credited with 957,178 pounds; the production in Ontario was 19,259,016 pounds; and in British Columbia the production is estimated at about 36,000,000 pounds. Ontario shows an increased production of about 3,512,317 pounds, or 22.3 per cent., while British Columbia shows a slight increase, the production in 1909 being estimated at 35,658,952 pounds.

The New York price of electrolytic copper during the year varied between the limits of 12 cents and 13¾ cents per pound, the average being 12.738, as compared with an average of 12.982 cents in 1909.

The total exports of copper contained in ore, matte and blister according to Customs Department returns, were 56,964,127 pounds, valued at $5,840,553. It will be noted that the exports agree very closely in number of pounds with the record of the production which

would be expected since practically all the copper is exported.

Lead.

The total production in 1910 of pig and manufactured lead was 32,987,508 pounds, valued at the average price of refined lead in Toronto, at $1,237,032.

The production of refined lead and lead contained in base bullion exported in 1909 was 45,857,424 pounds. A decreased production in 1910 is therefore shown of 12,869,916 pounds.

The production of both years was entirely from British Columbia. The falling off in the output of that province is due largely to the curtailment of production by several of the important Slocan mines, consequent to the destruction of railway facilities and of several mines buildings by forest fires.

The Blue Bell mine also, one of the leading shippers of lead in 1909, suspended operations early in 1910. Against these decreases may be placed the advent of the Sullivan mine, East Kootenay, into the list of shippers.

The exports of lead in ore during the year were 23 tons, and of pig lead, 3,856 tons, or a total of 3,879.

About 12,614 tons of domestic production were, therefore, available for home consumption.

The imports of lead in 1910 were 8,305 tons, valued at $525,265, in addition to which were manufactures valued at $107,688, and litharge, white and red lead, etc., $200,790, or a total value of $833,743.

The price of lead in Toronto during 1910 averaged about 3.750 cents per pound; in New York, 4.446 cents per pound; and in London, £12.920 per long ton.

The amount of bounty paid during the twelve months ending December 31, 1910, on account of lead production, was $318,308.28, as compared with a payment of $346,527.98 in 1909.

Nickel.

There has been a very large increase in the production of nickel-copper ores in Ontario during the past two years, and it is perhaps not generally realized that the production of nickel in this province is now almost as large, pound for pound, as the production of copper in British Columbia, while the market price of the metal is from two to three times that of copper. A portion of the production is, however, now recovered with copper as monel metal and sold at a much lower price than fine nickel. Active operations are being carried on by the same companies as formerly, viz.: the Mond Nickel Company, at Victoria Mines, and the Canadian Copper Company, at Copper Cliff.

The ore is first roasted and then smelted and converted to a Bessemer matte containing from 77 to 82 per cent. of the combined metals, copper and nickel; the matte being shipped to the United States and Great Britain for refining.

The total production of matte in 1910 was 35,033 tons, valued at the furnace at $5,380,064, an increase of $9,188 tons, or 31.6 per cent., over the production of 1909. The metallic contents were, copper, 19,259,016 pounds, and nickel, 37,271,033 pounds.

The aggregate results of the operations on the Sudbury District nickel-copper ores during the past three years were as follows, in tons of 2,000 pounds:—

	1908	1909	1910
Ore mined	409,551	451,892	652,392
Ore smelted	360,180	462,336	628,947
Bessemer matte produced	21,197	25,845	35,033
Bessemer matte shipped	21,210	.....	.....
Copper contents of matte shipped	7,503	7,873	9,630
Nickel contents of matte shipped	9,572	13,141	18,625
Spot value of matte shipped	$2,930,989	$3,913,017	$5,380,064
Wages paid	1,286,265	1,234,904	1,748,153
Men employed	1,690	1,735	.....

Exports of nickel contained in ore, matte, etc., as compiled from Customs reports, have been, for the twelve months ending December 31, as follows:

	1907	1908	1909	1910
	pounds	pounds	pounds	pounds
To Great Britain	2,518,338	2,554,486	3,843,763	5,335,331
To United States	16,857,997	16,865,407	21,772,635	30,679,451
	19,376,335	19,419,893	25,616,398	36,014,782

The price of refined nickel in New York remained practically constant throughout the year—the quotation being "Large lots, contract business, 40 to 45 cents per pound. Retail spot from 50 cents for 500-pound lots, up to 55 cents for 200-pound lots. The price for electrolytic is 5 cents higher."

Iron.

Iron Ore—Excluding Quebec, for which complete returns have not been received, the production of iron ore in 1910 was 254,915 short tons, valued at $566,109. The shipments may be classified as: magnetite, 124,535 tons; hematite, 130,380 tons. In 1909 the total shipments were 268,043 tons, valued at $659,316, and comprised magnetite, 74,240 tons; hematite, 190,473 tons, and bog ore, 3,330 tons.

Exports of iron ore from Canada during 1910 are recorded by the Customs Department as 114,499 tons, valued at $324,186. This is chiefly from Moose Mountain mine, Ontario, Torbrook, N.S., and Bathurst, N.B.

Although not a Canadian production, it may be of interest to state that the two Canadian companies operating the Wabana mines, shipped during the year 1,259,626 short tons, of which 808,762 tons were shipped to Sydney and 450,864 tons to the United States and Europe.

Pig Iron.—An increase of 5.58 per cent. is shown in the production of pig iron in Canada in 1910 as compared with 1909. The total production in 1910 was 800,797 short tons, valued at $11,245,630, as compared with 757,162 tons, valued at $9,581,864, in 1909. These figures do not include the output from electric furnaces making ferro-products, which are situated at Welland and Sault Ste. Marie, Ontario, and Buckingham, Quebec. Of the total output of pig iron during 1910, 17,164 tons, valued at $333,956, or $19.78 per short ton, were made with charcoal as fuel, and 783,633 tons, valued at $10,911,674, or $13.92 per ton, with coke. The amount of charcoal iron made in 1909 was 17,003 tons, and iron made with coke was 740,159 tons. The classification of the production of 1910, according to the purpose for which it was intended, was as follows: Bessemer, 219,492 tons; basic, 425,400 tons; foundry, including miscellaneous, 138,741 tons.

The amount of Canadian ore used during 1910 was 160,290 tons; imported ore, 1,406,668 tons; mill cinder, etc., 22,671 tons.

The amount of coke used during the year was 993,037 tons, comprising 499,717 tons from Canadian coal and 493,320 tons imported coke or coke made from imported coal.

The consumption of charcoal was 1,615,919 bushels. Limestone flux was used to the extent of 569,355 tons.

In connection with blast furnace operations there were employed 1,403 men and $1,006,727 were paid in wages.

The total daily capacity of 16 completed furnaces was, according to returns received, 2,880 tons.

The number of furnaces in blast, December 31, 1910, was 11.

The production of pig iron by provinces in 1909 and 1910 was as follows:—

Province.	1909			1910		
	Tons	Value	Per ton	Tons	Value	Per ton
Nova Scotia	345,380	$3,453,800	$10.00	300,287	$4,203,444	$12.00
Quebec	4,770	125,623	26.34	3,237	85,256	26.34
Ontario	407,012	6,002,441	14.75	447,296	6,956,930	15.55
Total	757,162	$9,581,864	$12.65	800,797	$11,245,630	$14.04

The exports of pig iron during the year are reported as 9,763 tons, valued at $296,310. Probably the greater part of this is ferro-silicon and ferro-phosphorus, produced at Welland and Buckingham, respectively.

There were imported during the year 227,753 tons of pig iron, valued at $3,122,695; 16,106 tons of charcoal pig, valued at $242,152, and 18,900 tons of ferro-manganese, valued at $464,741.

Steel.—The total production of ingots and castings in 1910 was approximately 822,281 short tons, of which 803,600 tons were ingots, and 18,681 tons were castings. The figures have been partially estimated, the records of the Ontario Iron and Steel Company having been unfortunately destroyed by fire. The production in 1909 was reported as 754,719 short tons, made up of 739,703 tons of ingots and 15,016 tons of castings.

Returns from seven of the principal rolling mills report the production in 1910 of steel in the following shapes; blooms and billets, 635,500 short tons; rails, 399,761 tons; rods and bars, 214,233 tons; miscellaneous rolled products, 23,167 tons.

The total bounty paid on iron and steel during 1910 was $1,344,144.59.

Asbestos.

The total shipments of asbestos in 1910, with one firm still to hear from, are reported as 75,678 tons, valued at $2,458,929, as compared with 63,349 tons, valued at $2,284,587, in 1909, an increase of about 19 per cent. in tonnage and 7.6 per cent. in total value.

The number of men employed in mines and mills is reported as 3,443, at a wage cost of $1,393,856. While the shipments are reported as above, the actual production was returned as 4,815 tons of crude and 91,353 tons of mill stock produced from 1,474,527 tons of asbestos rock, or a total production of 96,168 tons; stock on hand at the end of the year totalled 39,310 tons, as compared with 20,921 tons on hand at December 31, 1909.

The following tabulated statement shows the production and shipments during 1910 and the stock on hand at the end of the year:—

	Production	Shipments.			Stock on hand Dec. 31	
	Tons	Tons	Value	Per ton	Tons	Value
Crude No. 1	1,971	1,688	$ 445,130	$263.70	1,605	$ 426,782
Crude No. 2	2,844	1,732	171,684	99.12	2,842	405,419
Mill Stock No. 1	16,026	12,830	701,681	54.69	69,933	718,765
Mill Stock No. 2	56,321	42,612	997,987	23.42	24,541	591,752
Mill Stock No. 3	19,006	16,816	142,447	8.47	3,389	29,988
Total asbestos	96,168	75,678	$2,458,929	$32.49	39,310	$2,172,706
Asbestic	.....	24,707	17,629	0.71	.....	.....

In the absence of a uniform classification of asbestos of different grades, the above sub-divisions have been adopted purely on a valuation basis. Crude No. 1 comprising material valued at $200 and upwards, and Crude No. 2 under $200. Mill Stock No. 1 includes stock valued at from $45 to $100; No. 2, from $20 to $40. No. 3, under $20.

The shipments of asbestos in 1909 were in detail as follows:—

Crude No. 1, 912 tons, value $246,655, or $270.37 per ton.

Crude No. 2, 2,162 tons, value $328,855, or $152.11 per ton.

Mill stock No. 1, 14,776 tons, value $785,731, or $53.18 per ton.

Mill stock No. 2, 32,417 tons, value $800,728, or $24.70 per ton.

Mill stock No. 3, 13,082 tons, value $122,618, or $9.37 per ton.

Total, 63,349 tons, value $2,284,587, or $36.06 per ton; asbestic, 23,951 tons, value $17,188.

The exports of asbestos during the twelve months ending December, 1910, are reported by the Customs Department as 71,485 tons, valued at $2,108,632, comprising 57,939 tons, valued at $1,505,477 to the United States; 6,700 tons, value $280,452, to Great Britain; 440 tons, value $15,925, to Germany; 2,187 tons, value $94,619, to France, and 1,242 tons, value $43,948, to other countries.

The imports of manufactures of asbestos during the same period are reported as valued at $230,489.

Corundum.

There was an increased production of corundum in 1910. The quantity of corundum ore treated during the year was 37,183 tons, from which was produced 1,686 tons of grain corundum. The shipments were 106 tons sold in Canada and 1,774 tons sold in other countries, a total of 1,870 tons, valued at $198,680.

Coal and Coke.

The total coal production in Canada in 1910, comprising sales and shipments, colliery consumption and coal used in making coke, is estimated at 12,796,512 short tons, valued at $29,811,750. This is an increase of 2,295,037 tons, or nearly 22 per cent. over the production of 1909, and is the largest production of coal yet recorded for Canada.

There has been an increased production from practically all the larger collieries, while in the Province of Alberta many new mines are being opened up and

developed. The largest increases have been in the west—Alberta showing an increase of nearly 42 per cent., and British Columbia over 27 per cent.; while Nova Scotia shows an increase of a little over 13 per cent. The total production is almost equally divided this year between the eastern and western coal fields, while Alberta contributes about 22 per cent. of the whole, as compared with 10 per cent. in 1905 and 5 per cent. in 1900.

The production by provinces was approximately as follows, the figures for 1909 being also given. With respect to Alberta, while the table below shows a production in 1910 of 2,824,929 tons, the Provincial Mine Inspector estimates the output at over 3,000,000 tons.

Province	1909		1910	
	Tons	Value	Tons	Value
Nova Scotia	5,652,089	$11,354,643	6,407,091	$12,871,388
British Columbia	2,606,127	8,144,147	3,319,368	10,373,024
Alberta	1,994,741	4,838,109	2,824,929	6,161,055
Saskatchewan	192,125	296,339	190,484	293,448
New Brunswick	49,029	98,496	53,455	106,910
Yukon Territory	7,364	49,502	1,185	5,925
Totals	10,501,475	$24,781,236	12,796,512	$29,811,750

The exports of coal are reported by the Customs Department as 2,377,049 tons, valued at $6,077,350, as compared with exports of 1,588,099 tons in 1909, valued at $4,456,342.

Imports of coal during the year include bituminous 5,966,466 tons, valued at $11,919,341; slack, 1,365,281 tons, valued at $1,795,598, and anthracite, 3,266,235 tons, valued at $14,735,062, or a total of 10,597,982 tons, valued at $28,450,001.

There was a greater importation of each class of coal than in 1909, when the total imports were 9,872,924 tons.

Coke.—The production of oven coke in 1910 was about 897,273 short tons, as compared with a production of 862,011 tons in 1909. The total quantity of coal charged to ovens was 1,373,793 short tons. By provinces, the production was: Nova Scotia, 507,996 tons; Ontario, 25,959 tons; Alberta, 121,578 tons, and British Columbia, 241,740 tons. The coke is all made from Canadian coal with the exception of that made by the Atikokan Iron Company at Port Arthur, Ontario. All of the coke produced was used in Canada with the exception of 50,922 tons sold for export to the United States, chiefly from Alberta. The quantity sold for export in 1909 was 77,407 tons.

The quantity of coke imported during the calendar year was 737,088 tons, valued at $1,908,725, as compared with imports of 661,425 tons, valued at $1,508,627 in 1909.

Chromite.

No returns of production of chromite have been received, but 619 tons are reported as having been shipped by rail from Colcraine and Black Lake. An export of 15 tons, valued at $150, is also reported by the Customs Department

Petroleum and Natural Gas.

The production of crude petroleum shows another large falling off in 1910, the production being only 315,895 barrels, or 11,056,337 gallons, valued at $388,550, as compared with 420,755 barrels, or 14,726,433 gallons, valued at $559,604, in 1909. The average price per barrel was also less, being about $1.23 in 1910, as compared with $1.33 in 1909.

The above statistics of production have been kindly furnished by the Trade and Commerce Department, and represent the quantities of oil on which bounty was paid, the total bounty payments being $165,845.06 in 1910, and $220,896.50 in 1909.

The production in Ontario by districts, as furnished by the Supervisor of Petroleum Bounties, was, in 1910, as follows, in barrels:—Lambton, 205,456; Tilbury and Romney, 63,058; Bothwell, 36,998; Leamington, 141; Dutton, 7,752, and Onondaga (Brant County), 1,005.

The production in New Brunswick was 1,485 barrels.

In 1909 the production by districts was as follows, in barrels: Lambton, 243,123; Tilbury and Romney, 124,003; Bothwell, 38,092; Leamington, 5,929, and Dutton, 9,513. New Brunswick produced 95 barrels.

While the production has been decreasing, the imports, as might be expected, have been increasing. The total imports of petroleum oils, crude and refined, in 1910 were 67,949,643 gallons, valued at $3,133,449, in addition to 1,362,235 pounds of wax and candles, valued at $80,106. The oil imports included crude oil, 53,604,053 gallons; refined and illuminating oils, 7,656,727 gallons; lubricating oils, 3,071,257 gallons; other petroleum products, 2,607,606 gallons.

The production of natural gas was valued at $1,312,614, being $68,568 for the Province of Alberta and $1,244,046 for Ontario. These values represent as closely as can be ascertained the value received by the owners of the wells for gas produced and sold or used and do not necessarily represent what the consumers have to pay for the gas, since in a number of instances the gas is re-sold once or twice by pipe line companies before reaching the consumer. In Alberta, also, some gas is being used by brick manufacturers for which no estimate has been obtained as to quantity or value. The total quantity of gas used in Ontario exceeded 7,036 million feet, and in Alberta over 450 million feet. A considerable flow of gas is reported from the new wells of the Maritime Oil Company, Limited, in Albert County, New Brunswick, which it is proposed to pipe to Moncton.

Salt.

Complete returns of salt production show total sales of 84,092 tons, valued at $409,624 for the salt alone. Packages used were valued at $173,446. Stock on hand at the end of the year was reported as 2,474 tons. Two hundred and eight men were employed and $112,909 paid in wages. The production was about the same as in 1909.

Imports of salt during the calendar year were: salt in bulk and bags, dutiable, 20,174 tons, valued at $97,326, and salt free of duty, 108,794 tons, valued at $364,735.

Cement.

Complete statistics have been received from the manufacturers of cement, covering their production and shipments during the year 1910. These returns show that the total quantity of cement made during the year including both Portland and slag cement, was 4,396,282 barrels, as compared with 4,146,708 barrels in 1909, an increase of 249,574 barrels, or 6 per cent.

The total quantity of Canadian Portland cement sold during the year was 4,753,975 barrels, as compared with 4,067,709 barrels in 1909, an increase of 686,266 barrels, or 16.87 per cent. The total consumption of Portland cement in 1910, including Canadian and imported cement, and neglecting an export of Canadian cement valued at $12,914, was 5,103,285 barrels, as compared with 4,209,903 barrels in 1909, or an increase of 893,382 barrels, or 21.22 per cent.

The average price per barrel at the works in 1910 was $1.34, as compared with an average price of $1.31 reported for 1909, and $1.39 in 1908.

The imports of Portland cement into Canada during the twelve months ending December 31, 1910, were 1,222,586 cwt., valued at $468,046. This is equivalent to 349,310 barrels of 350 pounds, at an average price per barrel of $1.34. The imports in 1909 were 142,194 barrels, valued at $166,669, or an average price per barrel of $1.17.

The imports from Great Britain during 1910 were 23,880 barrels, valued at $130,951; from the United States, 168,972 barrels, valued at $253,463; from Belgium, 19,027 barrels, valued at $20,618, and from other countries, 37,431 barrels, valued at $63,014.

The estimated consumption of Portland cement in Canada for 1910 is 5,103,285 barrels. 93 per cent. of this was Canadian made.

*Short tons throughout.

(a) Exports.

(b) The metals, copper, lead, nickel and silver are for statistical and comparative purposes valued at the final average value of the refined metal. Pig iron is valued at the furnace, and non-metallic products at the mine or point of shipment.

(c) Copper content of smelter products and estimated recoveries from ores exported, at 12.982 cents per pound.

(d) The total production of pig iron in Canada in 1909 was 757,162 tons, valued at $9,581,864, of which it is estimated 607,718 tons, valued at $7,359,649, should be credited to imported ores.

(e) Refined lead and lead contained in base bullion exported at 3.690 cents per pound, the average price for the year in Toronto.

(f) Nickel content of matte produced at 36 cents per pound (the average minimum quotation for nickel in New York less 10 per cent). The value of the nickel contained in matte was, as returned by the operators, $2,810,748, or an average per pound of 10.7 cents.

(g) Estimated recoverable silver at 51.503 cents per ounce.

(h) Gross returns for sale of gas.

(i) Quantity on which bounty was paid and valued at $1.33 per barrel.

(k) Value received by shippers of silver cobalt ores for cobalt content.

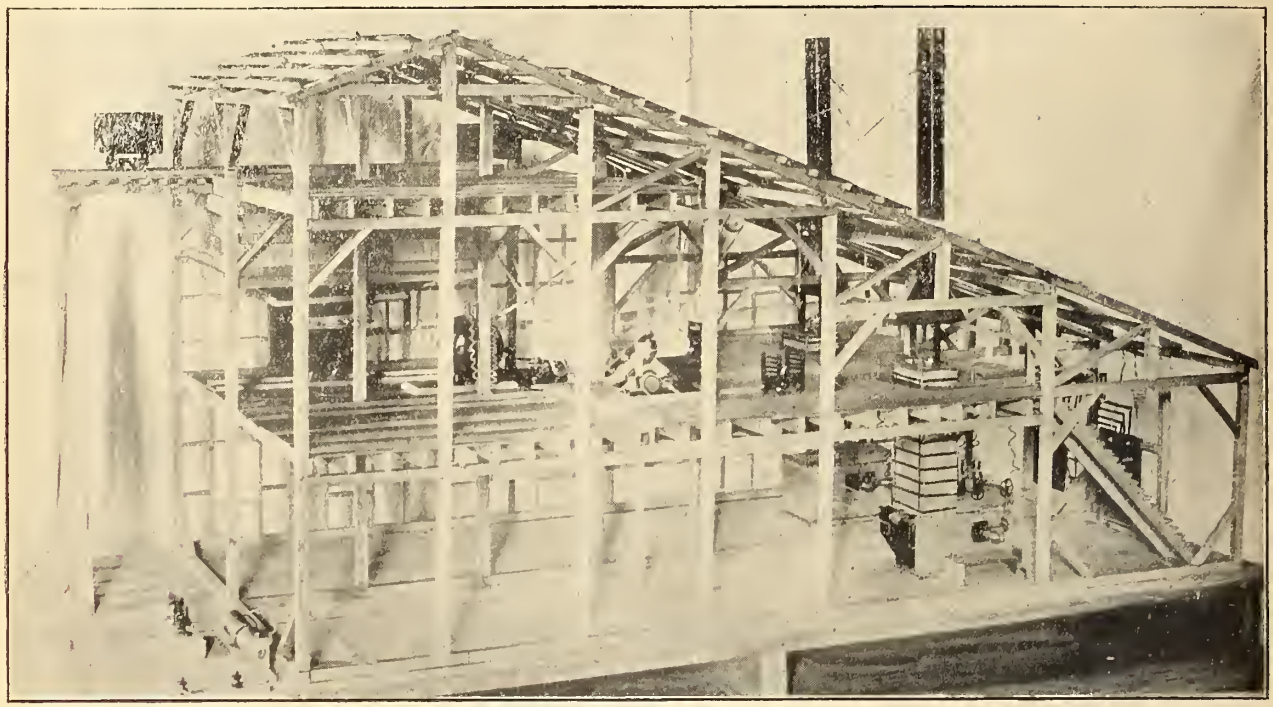
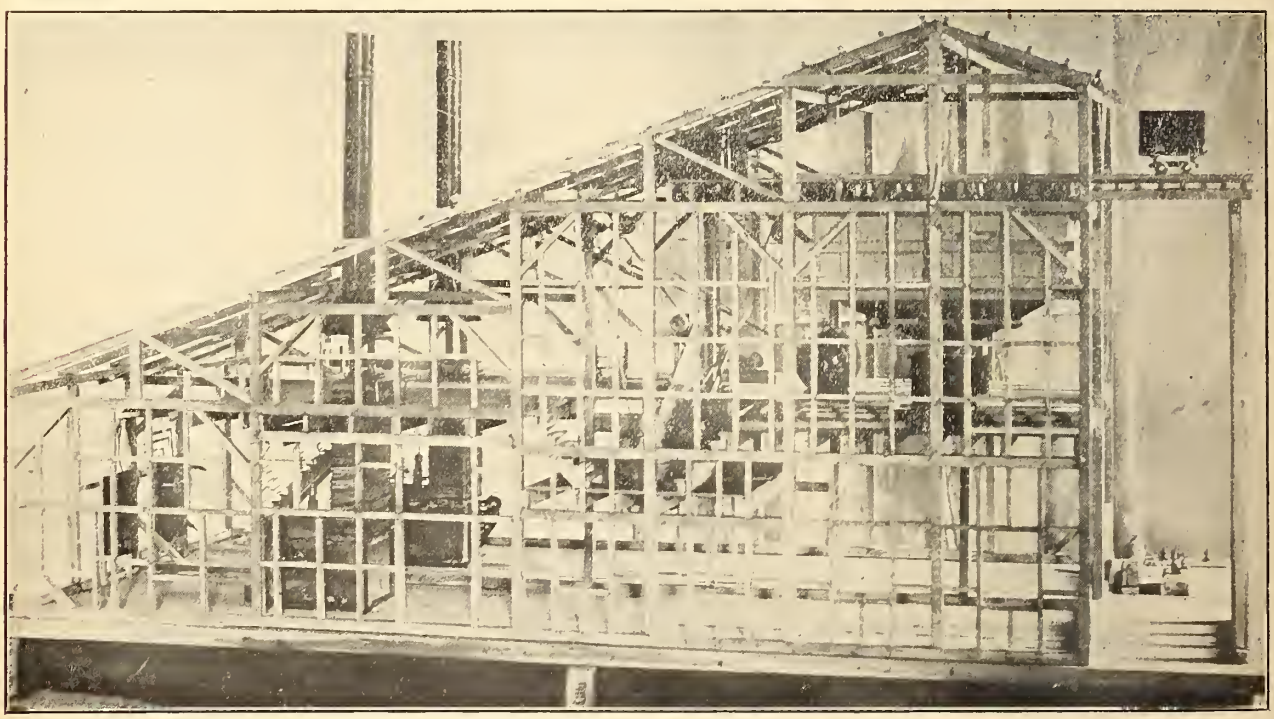
The Evans 5-ton Direct Electric Smelting Steel Plant.





The accompanying photographs give two views of the very ingenious model exhibited by Mr. J. W. Evans, of Belleville, Ont., at the Quebec meeting of the Canadian Mining Institute. The model is a complete working miniature of one 5-ton capacity unit of the J. W. Evans' Direct Electric Smelting Steel Plant.

The ground ore, limestone, charcoal, and fluorspar are brought in from the grinding building and dumped into their respective bins. All four bins empty over the portion of track connected to the weigh scales, s that the full charge can be weighed into a car belo without moving the car. It is then taken to the mixin machine, into which the charge is dumped. Lime-wat is added after the dry charge is mixed, and the mixir is continued for a few minutes. Then the moveab blades of the mixing machine are turned so as to mo the material towards the outside of the mixing m chine, a door in the side is opened, and the charge

nptied upon a belt-conveyor which takes it to the briquetting machine. The briquettes are then moved to he pre-heater and are fed into the furnace, as required, by an adjustable power feeder. The steel from he furnace is tapped into moulds the size of large lathe nd plane tools, or into billets for forging.

Mr. Evans' model attracted a large amount of attenion during the convention. It will probably be secured y the Geological Survey for the new museum in Otawa.

METALS.

Gold—The production, $60,918, though small, is nearly double in value that of 1909. More than half the yield came from the new camp at Porcupine, where active developments are in progress, and where large stamp mills are being erected at the Hollinger and Dome mines. A branch of the Temiskaming and Northern Ontario Railway—the Ontario Government line—is being built into Porcupine from the main line at Mileage 224, near Kelso. At Long Lake, on the Sault branch of the Canadian Pacific Railway, gold is being obtained by the Canadian Exploration Company from an arsenical ore. The old Mikado mine at Shoal Lake, Lake of the Woods, and the Havilah, formerly the Ophir, in the township of Galbraith, have been reopened. In Hastings county the Cordova or Belmont mine, long idle, has recently changed hands, and it is understood will soon go again into commission.

Silver.—The entire production, with a trifling exception, comes from the mines of Cobalt, including in that term not only Cobalt proper, but Gowganda and South Lorrain. Shipments comprised 27,394 tons of ore and 6,845 tons of concentrates, in all 34,316 tons, bringing the total shipments from the camp since the beginning up to 112,965 tons, of which 10,930 tons were concentrates. The total silver contents of the shipments for 1910 were 30,558,825 ounces, or an average of 890 ounces per ton, taking ore and concentrates together. For the whole period since the mines were opened Cobalt has produced 93,977,833 ounces of silver, which brought the mine-owners the sum of $48,327,280. The average tenor of the shipments fell from 1,309 ounces per ton in 1904 to 677 ounces per ton in 1907, in which year low-grade ores began to be shipped in considerable quantity, concentration plants not then having been introduced. In 1908 the effects of concentration, now a well-developed feature of the camp, began to be noticeable, and the average contents per ton rose to 758 ounces, in 1909 to 844 ounces, and in 1910 to 890 ounces. The improvement would have been still greater were it not for the large quantities of low-grade ore or rock which have been shipped to Denver and other smelting points for use largely as a flux, much of it containing less than 60 ounces silver per ton.

The extension of concentration processes—there being now 14 concentrating mills at work—the shipment of bar silver from several properties, and the introduction and universal adoption of hydraulically developed electrical power, were noticeable features of the Cobalt camp in 1910. The power transmitted from the falls on the Montreal and Matabitchewan Rivers has materially reduced the cost of operations, the price being lowered from about $150 per horse power when using steam to $50.

The prineipal producers at Cobalt were Nipissing, which led with a production of 5,584,742 ounces; Crown Reserve, 3,158,156 ounces; Kerr Lake, 2,877,299 ounces; Coniagas, 2,621,681 ounces; McKinley-Darragh-Savage, 2,607,071 ounces; Temiskaming, 1,887,127 ounces, and Buffalo, 1,514,895 ounces; others with large outputs were La Rose, O'Brien, Hudson Bay, Trethewey, Right of Way, etc.

In the newer fields of Gowganda and Elk Lake, six mines in the former shipped 480 tons of ore, containing 481,523 ounces of silver, and two in the latter 233 tons, containing 221,233 ounces.

Much the greater portion of the high-grade ore from Cobalt is now treated by refineries in Ontario. These are three in number, at Copper Cliff, Deloro, and Thorold. All produce merchantable bars for the London market. The quantity of silver recovered at these plants during the year was 14,574,837 ounces.

It may be pointed out that Ontario now ranks third among the silver-producing communities of the world, being surpassed only by Mexico and the United States. In 1910 her output was only one and a half million ounces short of the combined production of Montana,

Utah, and Nevada, the three largest silver states of the Union.

That silver-mining at Cobalt as a whole is a profitable undertaking may be deduced from the fact that the dividends declared in 1910 amounted to $7,275,240, or nearly one-half the total returns from the silver produced. Up to the end of the year the total dividends distributed amounted to $21,802,180, not including the profits made by two or three mines, either individually owned or close corporations.

Cobalt.—The quantity of cobalt shown in the table is only that part of the output for which the mining companies were paid by purchasers of ore. A much larger quantity was shipped out, but for the most part brought no returns. No assays of it are made or records kept, consequently no exact data are available. The price of cobalt oxide has fallen to 75 or 80 cents per pound, and further reductions seem inevitable, if the law of supply and demand is allowed to have its natural effect.

Nickel.—The nickel-copper mines of the Sudbury region, now the most important source of nickel not only in America but in the world, were operated vigorously in 1910, and the output of nickel—18,636 tons—exceeds that of 1909, previously the largest on record, by 5,495 tons. The matte product of the Bessemer furnaces was 35,033 tons, and the value of the nickel contents was returned at $4,005,961, or 10.7 cents per pound. Valued at 40 cents, the price quoted for refined nickel in New York, the output of nickel was worth $14,908,800, but credit is taken herein at the smaller figure only, which represents, or is supposed to represent, the value of the nickel in the matte, when it leaves the smelters for the United States or Wales, where the final separation and refinement take place.

There are two companies mining and producing nickel, the Canadian Copper Company, whose works are at Copper Cliff, and the Mond Nickel Company at Victoria Mines. Both operate well-equipped plants, first smelting the ore and then converting it into a Bessemer matte containing approximately 80 per cent. of nickel and copper. The Canadian Copper Company draws its supplies of ore principally from the Creighton and Crean Hill mines, the former being richer in nickel than in copper, and the latter vice versa. Hitherto the Victoria Mines have been the chief sources of supply for the Mond Company, but latterly the Garson mine has been largely drawn upon, and the company has under consideration the removal of its furnaces to a point east of Sudbury and nearer the Garson ore body. Both companies operate their mines and works by electrical power, the Copper Company utilizing falls on the Spanish River, and the Mond Company falls on the Vermilion. The Dominion Nickel-Copper Company, formed to work large deposits of ore on the northern range, has not yet reached the stage of production.

The nickel contents of the silver-cobalt ores, which yield nothing to the mine owners, are not here included in the output of nickel.

Copper.—Most of the copper produced in Ontario is found accompanying the nickel in the ores of Sudbury, consequently the yield rises or falls with that of the principal metal. The copper contents of the matte produced in 1910 amounted to 9,630 tons, valued at $1,374,103, or at the rate of 7.1 cents per pound. If reckoned at the average value of electrolytic copper in New York for 1910, viz.: 12.73 cents per pound, the value would be $2,451,798. A small part of the copper is to be credited to Bruce Mines, from which a quantity of silicious ore was shipped to Victoria Mines and used for converter linings.

Iron Ore and Pig Iron.—Four iron mines were in operation in 1910, producing 231,453 tons of ore, which is a falling-off as compared with 1909, when the output was 263,777 tons. Of the ore 119,207 tons was magnetite from Moose Mountain, Atikokan and Bessemer; 112,246 tons was hematite from Helen mine. The ore was returned as worth $513,538, or $2.21 per ton. The Lake Superior Corporation has been developing an iron prospect called the Magpie mine in Michipicoten district, and has ascertained by borings that it contains a large body. The ore is sideritic, but preliminary roasting will reduce the sulphur contents and raise the percentage of metallic iron. At Moose Mountain it is proposed to increase the capacity of the magnetic concentrator plant.

There were eight blast furnaces at work producing pig iron last year, the total yield being 447,351 tons. The total quantity of ore charged into the furnaces was 822,174 tons, of which 143,284 tons was of domestic and 678,890 tons of foreign origin. The value of the pig product was $6,975,418. Steel produced amounted to 331,321 tons, valued at $7,855,407.

Non-Metals.

Building Materials.—The raw materials for building purposes are plentiful in Ontario, including clay for making brick, etc., limestone for lime and construction work, sandstone and granite, Portland cement, etc. Building operations were brisk and called for an increased production of brick and lime as compared with 1909. The Portland cement industry is steadily growing, the production being 2,889,235 barrels, as compared with 2,633,500 barrels in 1909. The aggregate value of products which may be classed as construction materials, including brick and other clay products, stone, Portland cement, and lime, was $7,961,060. Part of the stone, however, was for use as flux in blast furnaces and road-making.

Petroleum.—Of late years the production of petroleum has been declining. In 1910 the yield amounted to only 11,004,357 Imperial gallons, which is about one-third the production of 20 years ago. The diminution is most marked in the newer field of Tilbury, but is also going on in the older districts of Petrolea and Oil Springs. The average production per well is now very small, averaging only a few gallons daily. A new oil pool was located during the year in Onondaga township, Brant County, but the production has not yet been important.

Natural Gas.—On the other hand, the flow of natural gas is increasing year by year, in 1910 amounting in value to $1,490,334, at a low rate per thousand cubic feet, as compared with $1,188,179 in 1909. The gas fields are confined to the Lake Erie counties, but the gas finds a ready market not only in the localities in which it is produced, but also in the cities, towns and villages of southwestern Ontario. Several wells have been drilled in the shallow water along the shore of the lake, and a new field is being exploited in the township of Bayham, Elgin County.

Minor Products.—The list of Ontario minerals is long and varied, and a number of other substances in the table of production constitute the basis of industries of considerable importance. Among these are salt, corundum, iron pyrites, feldspar, quartz, graphite, talc, gypsum, arsenic, etc. It is not, however, necessary in a summary statement of this kind to refer to these at length.

Preliminary Statement of the Mineral Production of the Province of Quebec, during the year 1910.

Totals		$7,072,244	$5,552,062

The above table presents the preliminary figures of he mineral production of the Province of Quebec, as ompiled from the returns so far received from the roducers, for the year ending December 31st, 1910. he total will be seen to be $7,072,244, an increase of 1,520,132 over the total of the revised production for he preceding year 1909, which is given in the adjoin ng columns.

At first sight the increase may appear very large. ut it must be said that to a certain extent it is more pparent than real, and is in a measure due to a more horough collecting of data of such products as struc ural materials, mineral waters, etc. Nevertheless a omparison of the various individual items for 1910 ith those for 1909 will show substantial increases in lmost every case, indicating on the whole a very grati ying state of the mineral industry in the province.

The following table gives the annual value of the ineral production of the province for the last decade:

Year	Value.
1901	$2,997,731
1902	2,985,463
1903	2,772,762
1904	3,023,568
1905	3,750,300
1906	5,019,932
1907	5,391,368
1908	5,458,998
1909	5,542,062
1910	7,072,244

Asbestos.

The asbestos and asbestie sold and shipped during he year amounted to 102,591 tons, representing a alue of $2,553,277, as follows:

	Tons.	Value.
Crude Asbestos, No. 1, No. 2 and No. 3	3,529	$ 620,186
Mill Stoek	74,346	1,915,477
	77,875	$2,535,664
Asbestic	24,716	17,613
	102,591	$2,553,277

This is a substantial increase over the preceding year, but is slightly below the value of the asbestos and asbestie produced in the banner year 1908, when it reaehed $2,577,302.

The asbestos industry in 1910 was very aetive; mueh more so than the figures given above seem to indicate, for at the close of the year eonsiderable stoeks remained on hand. There was, in faet, an over-produetion and the market could not absorb all the output of the mills. From this cause the asbestos industry is at present undergoing a slight crisis, but everything points to this as being only a temporary embarrassment, and there is no doubt that within a short time there will be a readjustment between eonsumption and production.

The mines themselves and the mills are in exeellent condition. At the depths reached, over 200 feet in some cases, there is no apparent decrease in the contents of asbestos of the rock.

Iron Ores.

The returns reeeived from pig iron producers give a quantity of 7,601 tons of bog iron ore, to which they assign a much higher value per ton than in past years. This is perhaps due to the fact that formerly the iron producers worked some iron deposits themselves, and their retnrns properly gave the actual cost of mining. Whereas at present the bog iron ore used in the furnaces is obtained from numerous small producers, and the price assigned to the ore represents its value delivered at the furnaee.

We do not include in the total production the value of the pig iron made. There was in 1910 a quantity of 2,890 tons, valued at $91,000. This is high grade wood-eharcoal pig iron, which brings a high price in the market.

The titaniferous iron ore was mined from the St. Urbain deposits. Part of it was used in the manufaeture of steel, and the rest in the manufacture of a eertain grade of eleetrodes. All was exported.

Mica and Phosphate.

Both products show very substantial increases in sales and shipments. A large proportion of these were made from stocks carried over from the previous year, and the actual mining of these substances was not very active throughout the vear. The market is, however, markedly improving and everything points to a greater activity during the eoming year. The greater part of the phosphate was used in the manufacture of phosphorus.

Copper and Iron Pyrites.

The largest producer is still the Eustis Mining Company, but a new mine, operated by the Eastern Canada Smelter Company at Weedon, has also made substantial shipments.

Cement.

The products of this industry in the Provinee of Quebee show an inerease in value of $640,095, whieh is a proportionate increase of 48 per cent. over the valne

of the production of the preceding year. Such increases are significant and indicate the preponderating part which cement is taking among the building materials. It is sufficient to recall that in 1904 the total production of cement in the province was slightly over $50,000, while two years later it was $625,000. It is now nearly $2,000,000.

OTHER STRUCTURAL MATERIALS.

All of the other building materials show very large increases as compared with the previous years. Part of these increases, as was mentioned before, is undoubtedly due to a more thorough collecting of figures, but, nevertheless, there has been a much greater building activity throughout the province than ever before.

It will be noticed that the item sewer pipes, tiles and pottery on the other hand has decreased from $270,000 in 1908 and $125,000 in 1909, to $103,000 in 1910. This is not to be taken as an indication of a decrease in the manufacture of these clay products, but is owing to the fact that the production of several important manufacturers of sewer pipes, tiles and pottery, which was included in previous years was eliminated this year, on discovering that they use clay imported from New Jersey. The value of such products would have amounted this year to over $350,000.

OUR LONDON LETTER

Mining Advances in 1910—Interesting Rand Developments—Treating Refractory Ores in West Africa—More About Nigerian Tin and the Tin Boom—Electricity in British Collieries—Russian Platinum Developments.

(Exclusive correspondence of CANADIAN MINING JOURNAL.)

London, January 21st, 1911.

Last year was an extremely interesting period for the miner. Especially it saw great advances made in metallurgy, accompanied by substantial improvements in mechanical appliances and chemistry. This tide of progress has swept ever up towards the practicability of profitable treatment of very low grade ores, especially gold and copper. On the Rand four-pennyweight stuff can now be dealt with.

The increasing use of tube mills as aids to the stamp battery was another feature of the year. The new heavy stamps of the East Rand Proprietory with tubes succeeded in crushing 24 tons per stamp in 24 hours. Most of the Rand companies proceeded strongly in the direction of adding tube mills where they wished to increase the capacity of their reduction works rather than by adding further stamps. The heavier stamps of the year were about 1,800 pounds, but soon 2,000-pound stamps will be in operation easily crushing 20 tons or more per stamp per 24-hour day, the limit being set by the coarseness of screen employed. Generally, the lines of mining improvement of the year may be summarized as larger mining areas, fewer shafts, greater tramming distances, larger scale of handling ore, and freer and wider ideas in the laying out of underground workings.

In ore breaking, day shifts only are now worked in many mines, making each contractor solely responsible for his own stope. This results in narrower stopes (less waste being broken down) and more effective supervision of the natives employed. The question of the employment of small rock drills, whilst not finally settled, has made considerable progress. The 100-pound weight drill has been found too light for the rough work in the mine, but 150-pound drills, with two natives to each, are giving satisfactory results. In this direction lie possibilities of finding an efficient substitute for the many thousands of hammer-boys employed on the Rand, permitting this labour to be otherwise employed. The view largely obtains that we are on the eve of securing a practical small stope drill which will liberate a large number of the natives employed underground for other work, and so relieve the pressure of the demand for more native labour.

Overhead mechanical transport on the Rand has made substantial advances also and a wire rope railway over the Brakpan mine has been invented to operate on 2,000 tons per day of 10 hours at a total cost of $35 per day. Sand filling of stopes from the tremendous waste heaps of the Rand came into practice during 1910 and plants are at present under construction to deal with sands at the rate of 4,000,000 tons per annum. Ventilation in the deep mines also came to the front owing to the adoption by the Cinderella Deep of a Capell fan having a discharge capacity of 50,000 feet of air per minute. The necessity for this movement is clear when we consider that in the deepest mines of the Rand the temperature rises at the rate of one degree Fahr. for every 25 feet vertical, as compared with one degree for 65 feet in the deepest mines of the European Continent.

The much discussed Marriott square fathom system for attaining better results has not yet secured wide adhesion on the Rand, although the Ecksteins have adopted it. It is claimed that this system, although it would raise working costs, would yield higher profits on a given block of ore. Other new Rand methods of mining deal with the flat reefs in the Far Eastern section. These place the levels as much as 1,000 feet apart independent of the variations of the reefs, which makes for cheaper haulage.

In the West African goldfields the treatment of refractory ores made a distinct advance in the past year, especially on the property of the Ashanti goldfields. These ores are quarried in the Justice's Find property. In former days the process employed was ordinary wet stamp milling, followed by cyaniding, but as this ore contains graphite material and small quantities of various sulphides only 60 per cent. of the gold was recovered. The new process consists of dry crushing, followed by roasting and cyaniding, which has resulted in the extraction being raised to 90 per cent. The cost of treatment by the new process is $1.50 per ton higher, but the increased extraction on 15 pennyweights ore amounts to $3.12 per ton. The ore, after being broken in a rock breaker, is fed as 2½-inch cubes into Krupp ball mills. It is then roasted in Edwards' furnaces and finally treated in the cyanide vats. On leaving the furnaces the ore loses about 12 per cent. of its weight being deprived of its graphite and most of its sulphur and arsenic contents. For the year ended 30th June 1910, 47,091 tons of Justice's ore gave $10.84 per ton with a 90 per cent. extraction.

Your correspondent's articles last year contained reference to the birth of tin mining in Northern Nigeria. The Government in control of that British territory is seeking to do all that it can to prevent investors here from being robbed by wild-cat schemes and are and 16 feet deep. Strenuous efforts are being made

rush on the railway, especially to the Bouchi field. At the present time there is a twelve to fifteen days' march between the present rail head and the tin mines.

Especial interest is, of course, given to the discoveries by the persistent rise in the price of the metal. At the time of writing the figure is $950 per ton and users are at their wits' ends. For six months prior to last August the price of tin remained steady in the neighbourhood of $750 per ton. This rise, of course, is largely attributed to the cornering operations of a strong Continental syndicate. At the same time the tinplate trade of this country has been persistently active during the past year, as it has also been in America. In 1903 the tinplate mills dropped to 360. That was the minimum and since then the trade has recovered so rapidly that there are now over 500 mills in operation, more than produce evidence of substantial financial resources before concessions and mining rights are granted. Returned prospectors told glowing stories of the huge extent of the tin-bearing area with its black sands 15 insisting that every concessionaire or company shall before the McKinley tariff came into operation. Thirty-five mills were built last year and 59 more are in course of erection. Quite 1,500 tons more tin is already required to keep pace with the contracts now coming forward, many new mills having been opened in South Wales. At the end of 1910 visible tin supplies were under 18,000 tons, a decline of nearly 4,500 tons on the year.

In its way, the rubber boom, by attracting labour from the Straits Settlements' tin mines, has reduced production there. The offer of double the old rate of wages to the native labourers has recently failed to attract sufficient men.

Rapid advances in the use of electricity in British collieries are the order of the day. Additions are being made more rapidly to the series of overhead and underground cables which now extend throughout the area of the North of England collieries. The system of electric supply in these districts consists of the generation of power at 6,000 volts at a number of generating stations, some of which utilize the waste heat of blast furnaces and coke ovens. The power is transmitted to various sub-stations at this pressure, where it is transformed to 3,000 and to 440 volts, and also to 11,000 and 20,000 volts. At the majority of the collieries and works the power is employed at 3,000 volts; in some cases 440 volts, 3-phase, is utilized, while at others it is transformed to direct current and used at 600 or 480 volts. In the Cleveland area a new 11,000-volt pole line is being laid. The poles have a span of 80 yards, and carry three .05 square inch copper conductors, as well as pilot and telephone cables suspended from the catenary.

The recent high level prices touched for platinum ($40 per ounce) is attributed to the same cause that occasioned the similar advance in 1906. Consumption of the mineral expands steadily and new uses are continually being discovered. The world's annual consumption is estimated now at about 360,000 ounces, about one-third of this being metal recovered from scrap and re-marketed. France absorbs about 40 per cent. of the production, Germany and America each about 26 per cent., and Great Britain 7 per cent. The remainder is absorbed in Russia, which is the sole source of supply. In that country the bulk of the metal is obtained by placer mining from the alluvial sands of the Ural Mountains. Small quantities are obtained from time to time in other Continental countries, but the largest producer outside of Russia is Colombia, South America, with an output of between 6,000 and 7,000 ounces per year.

Official Russian figures show that the annual production has averaged in recent years about 175,000 ounces, but illegal trading probably accounts for quite one-third more than this. The platinum yielding sands are now comparatively exhausted, much of the alluvium now worked yielding not more than one pennyweight per ton, whilst even the richer sands do not yield more than three pennyweights.

Until 1898 the producers in Russia were absolutely in the hands of big refining firms abroad, who purchased the output years ahead, practically all the metal produced being exported in a crude state for refining abroad in the principal consuming markets. In the year mentioned Russian producers controlling 60 per cent. of the output were formed into one concern at the instigation of French financiers. Thus, the Compagnie Industrielle du Platine, which has since taken a leading part in the industry, was then established. The "tied" condition of the majority of the producers as regards their output accounts in a large measure for the continued falling off in the production, notwithstanding the high prices which have ruled. As their output is sold ahead for years to come at prices said to average less than $15 per ounce, producers have not benefitted to any extent from the high prices which have ruled, and accordingly not only is the incentive lacking to increase the production, but there is distinct encouragement to conserve the remaining but steadily-dwindling supplies in the hope that advantage may be obtained later on of the higher values now ruling.

At the beginning of last year the discontent of producers crystallized into an active propaganda for the establishment of a Government monopoly, or the passing of legislation which would free the smaller miners from the grip of the foreign refining houses. At a meeting then held, proposals were formulated and pressed on the Government, but after a time seemed to have been shelved indefinitely. Quite recently, however, the Russian Minister of Trade and Industry has come forward with proposals for regulating the industry on lines somewhat similar to those suggested by the producers last year. Briefly, it is proposed to prohibit the export of crude platinum and to provide for its treatment in Russia by means of a State refinery should private enterprise fail to prove equal to the task. The crude platinum would be sold to the Russian Imperial Bank on certain specified terms—the price suggested by the producers last year was $19.86 per ounce troy or crude 83 per cent. platinum—and the marketing of the refined product would be left in the hands of the Bank, which would account to the placer owners for the balance of the price, less commission. The production, refining, and distribution of the metal would be strictly governed by hard-and-fast regulations, any breach of which would bring upon the offenders condign punishment in the shape of heavy penalties.

To transmit a given volume of compressed air through a 1-inch pipe of given length requires over three times as much pressure as is required to pass it through a 2-inch pipe of the same length.

A volume of 500 cubic feet of free air per minute, at 5-lb. gauge pressure, can be transmitted 1,000 feet, through 3-inch pipe, with a loss of only 4.1-lb. If a 5-inch pipe be used, the loss is reduced to 0.25 lb.

MINE ACCOUNTS AND COST SHEETS

(From the Bulletin of the Institution of Mining and Metallurgy.)

(Continued from last issue)

In pursuance of the objects stated, therefore, the following suggestions are put forward merely as broad principles, which the Committee consider should be adhered to as far as possible by all metalliferous mines in framing their general accounts, cost sheets and working statements, after the various amounts spent on Wages, Stores, Materials, Power, Repairs, Maintenance, etc., have been segregated and allocated as much as may be necessary for the intermediate working accounts of each mine, which are required for the information of the mine officials and for the preparation of the final Working Costs.

Capital Expenditure.

Before the producing stage is reached, all expenditure should be charged to Capital Account and grouped as follows:—

Property.
Main vertical shafts or main adits.
Machinery and plant.
All shafts which develop ore, and underground development.
Buildings.
Surface works (reservoirs, water service, railway sidings, roads, etc.).
General expenditure.

Sundry Revenue during this stage should be deducted from General Expenses, Head Office Charges, etc., and the balance distributed proportionately over the remaining heads of expenditure since the acquisition of the property.

All vertical deep-level shafts, and shafts sunk to reach the plane of the orebodies, should be charged to Capital Account. All incline shafts in ore and shafts which assist development, as they progress, should be considered as part of the expense of development, the latter being either—

(a) Placed to a Temporary Development Account; or
(b) Charged to Capital Account finally.

Theoretically, the cost of vertical shafts should be written off under the heading of Depreciation, i.e., a proportion for each year over an average life; but in practice this is seldom found to be desirable.

After the producing stage is reached, all expenses of development, including deepening main shafts, sinking incline shafts, cutting stations, drives, cross-cuts (including main cross-cuts), winzes, raises, etc., should be charged—

(b) To the Development Redemption Account.
(a) Direct to the Working Costs; or

In the latter case, working costs should be regularly debited with a rate of Development Redemption per ton milled, slightly in excess of the average cost at which the total, fully-developed and payable ore reserves stand in the books—the object being to extinguish gradually the temporary account, and thereafter to charge all current development and shaft-sinking to Working Costs, or to provide funds for securing a gradual and automatic increase in the ore reserves. The quantity of ore developed cannot, it is true, be well ascertained at short intervals, but it can be determined annually more or less closely, and a fair rate can then be fixed as the price per ton under (b).

After the producing stage is reached, no expenditur should be debited to Capital Account, except for larg special items, such as:—

Purchase of additional property.
Increase of machinery or plant, to increase power, ou put or extraction.
Erection of additional buildings, dams, etc.
Sinking of new main shafts to reach orebodies.
Excess development of payable ore that can be clearl proved to be excess development, guarding carefull against abuse.

Such items of capital expenditure should bear the proportion of the administration and general expenses

No small items, repairs, maintenance, or merely r placement of worn-out machinery, should be charged t Capital Account, which should be considered as close except for heavy expenditure specially authorized whe funds are specially raised, or allocated for the purpos Each additional large installation should be shown se arately in the Balance Sheet if possible.

In cases where a new deep shaft, with its equipmen takes the place of an old shallow shaft, or an old mi is replaced by a new one, the old shaft or the old pla should be written off from Capital Account again Revenue, either at once or by means of instalmen spread over a short period. Alternatively, if no depr ciation is written off, the cost of the new plant shou be charged direct to Revenue, by instalments if nece sary.

Temporary Accounts.—In addition to the Develo ment Account, there are other temporary accoun which cannot always be avoided, especially in rega to annual payments, a portion of which has to l charged up each month; but they should be avoid wherever possible, and extinguished at a more rap rate than would appear to be necessary. Such tempo ary accounts might include such items as:—Insuranc licenses, native recruiting fees, conveyor-belts, haulir ropes, etc.

Valuations for Balance Sheet.—The cost of or reserves and dumps of payable ore should automatical appear at first as an asset in the Balance Sheet, unt extinguished by Redemption. The gross or net val of such ore-reserves should not be considered as Rev nue, or as an asset. Unfinished products, when tak into account, should be reckoned only at cost. pr vided such cost does not exceed market value. Bu lion, concentrates, or other marketable products rea for shipment, should be shown as assets in the Balan Sheet, and included as Revenue, after deducting a possible returning or other realization charges.

Realization charges should be preferably included costs, rather than deducted from yield of mineral, et so that the value may correspond to the extraction a that costs may duly reflect varying charges for realiz tion and smelting charges, freight, etc.

Depreciation.—Under the head of Capital Accour reference has been already made to this question as r gards depreciation of main shafts with their equipmer and milling plants which are becoming or have becon obsolete.

Depreciation of property (i.e., mining claims, etc.) is also correct in theory, especially in the case of mines with fixed vertical boundaries and limited orebodies, the approximate rate of exhaustion of which is therefore ascertainable. Similarly, it would be logically correct to write off systematically the cost of main shafts sunk to orebodies before the development stage is reached. In most cases of mining enterprise, however, it would be impossible to make an accurate allowance for depreciation of either property or main shafts, and even in cases where such a course is possible it appears to be never carried out. The result of such a course, when depreciation is written off Profit and Loss Account, is only to accumulate cash for future shareholders whilst reducing the rate of dividends for existing shareholders. Mining is looked upon usually, and perhaps to some extent rightly, as being on a different footing from most kinds of commercial enterprise, and shareholders in mining companies, as a rule, prefer to take their proportion of the gross profits in the form of dividends, and make their own allowance for depreciation.

As regards machinery and plant, buildings and surface works, auditors in England insist on annual depreciation of machinery, plant, etc., which is, of course, theoretically correct, and to some extent it is useful for reducing Income and Profit Taxes and Fire Insurance Premiums; and, when carried out on a very liberal scale, would in some cases give shareholders a rough idea of the value of such assets.

Auditors abroad, on the other hand, do not always insist on Depreciation on machinery and plant, buildings, etc., being allowed for, and a large number of companies registered abroad do not write off the plant at all.

After all, depreciation of plant on mines is often in practice unnecessary—new and improved plant is erected almost continually—the old plant has to be well maintained or replaced for efficient work.

The important object is to make, by some means, adequate provision out of revenue for such new machinery, plant, buildings and surface works, as are almost certain to be required before the mine is worked out, and, provided this object be attained, the means employed would appear to be of minor importance. Depreciation is, of course, the more usual method, and appears to be more generally preferred.

Other methods, however, are to include regularly in working costs a monthly or quarterly allowance for a fund to be called "Provisions for Additions to Machinery and Plant," or to appropriate each year a certain proportion of the profits to a special reserve fund. These alternative methods tend to simplify accounts and, when ample cash reserves are kept in hand, such simple methods of obtaining the principal object aimed at by Depreciation appear to work well.

Too much stress cannot be laid upon the fact that the accuracy of accounts depends very largely upon the accuraey of the data obtained through careful surveying, sampling, and assaying, and upon the correct allocation of all items of expenditure.

Working Accounts, Cost Sheets, and Reports.

The main sub-divisions of the ordinary Profit and Loss Accounts usually presented to the shareholders of a company should correspond with the main sub-divisions of the Cost Sheets. The accurate determination of Working Costs is, obviously, greatly complicated by the inherent difference in the nature of Capital and Revenue charges, the results of the former class of expenditure being frequently deferred for a considerable time, whilst the latter lead to results that can be closely estimated at once.

Working Costs may be, and frequently are, based on different units, such as the ton of ore, foot of progress, cubic foot or fathom of ore mined, ton or pound of metal produced, and in the case of base metal mines it is generally most important to ascertain and keep records of the last-named factor, in order to arrive at the financial results of the undertaking.

The ton is, however, the commonly recognized unit employed for administration purposes.

In this connection it is very important to determine the actual weight of the ore per unit of measurement, i.e., the number of cubic feet to the ton (taking cavities, moisture, etc., into account) for making "tonnage cost" calculations.

The Committee recommend that all statements of cost calculated upon a unit of this kind should state clearly the unit referred to, thus:—"Based on tonnage milled:" "tonnage of concentrates treated," etc., and that all statements of Working Costs presented in the ordinary accounts should be based on the cost per ton milled or treated, and not on ore mined, as is sometimes done. At the same time, cost per ton of ore mined and per ton of products specially treated are necessary for departmental supervision and returns.

In figuring out Working Costs, the charges that lie on the border-line between various primary and different sub-headings of expenditure are sometimes difficult to locate; and finally, a stage is reached where further detail in the dissection of expenditure becomes merely a refinement of little practical value, which does not justify the cost of collecting it. An accurate knowledge of the distribution of important "supplies used underground," such as timber and explosives, is, obviously, of the first importance; but minor supplies, such as steel, candles, picks and shovels, cannot be apportioned to particular levels and stopes without an expense and strain upon foremen and storekeepers rarely worth the information gained except under special circumstances; this applies more particularly to large mines.

The Committee feel that the consideration of various forms of detail cost sheets would widen the scope of their Report too much, and render it impossible to make any recommendations; but they submit that, in their opinion, the following general principles should be observed in the preparation of all cost sheets, since they consider that these are applicable in most, if not all cases, and are capable of being expanded or modified in detail to meet the special requirements of any particular case.

The Committee think it is possible and desirable to classify all expenditure under the following main heads, which may sometimes be extended to cover such special items as "removal of overburden" and "prospecting for new orebodies."

1. Development.
2. Extraction of Ore (i.e., mining).
3. Sorting at Surface, Preliminary Crushing and Transport.
4. Reduction Costs (i.e., ore treatment).
5. Administration Charges and General Charges at Mine.
6. Realization Charges on Products.
7. Taxes and Royalties of all kinds, shown separately.
8. Head Office Charges.

The total Capital Expenditure should also be shown on all General Expenditure sheets.

The sub-division of these main heads into sub-heads must necessarily depend somewhat upon the conditions, but the advantages of adhering as closely as possible to one form, and departing from it only where necessary, are manifest. The following may be suggested as desirable sub-divisions:—

1. DEVELOPMENT COSTS as charged may be either the actual expenditure on shaft-sinking, station-cutting, drives, cross-cuts, winzes, raises, diamond drilling, maintenance, etc., or a liberal rate of redemption for those charges. Development should be charged its proper proportion of surveying, sampling and assaying costs, pumping and hoisting costs, and be credited with the ore won in development at the average stoping cost, the amount being charged to mining. In the general Cost-sheet, Development Costs need only appear in one total, but a detailed sheet should be prepared, showing the total expenditure and cost per foot in shaft-sinking, driving, cross-cutting, raising, winzing, and plat (or station) cutting separately, as well as the proportions of the expenditure which are for labour and for materials respectively.

2. EXTRACTION OF ORE may be usefully divided into:—
   (a) Stoping or breaking of ore, including under sub-heads:—Compressed air, hand drilling, and rock-drill costs, labour and supplies, shovelling, etc.
   (b) Timbering, filling excavations, and sorting of ore in stopes.
   (c) Hoisting.
   (d) Pumping.
   NOTE.—In cases where a mine is only just beginning to come into partial production, and is still carrying on heavy capital expenditure, the cost of pumping may be divided between Capital and Revenue in any desired proportion.
   (e) Underground tramming.
   (f) Sampling, assaying and surveying.
   (g) General underground maintenance.

It is suggested that these sub-divisions of the main head, Mining or Extraction of Ore, should be set out in detail in the general cost sheet, because mining is at once the principal item of working cost and offers the greatest scope for economies.

3. SURFACE TRANSPORT, SORTING AND COARSE CRUSHING.—The conditions of these vary so much at individual mines, that for standardization and comparative purposes a separate heading should be given for these three items combined, so as clearly to divide "Mining" and "Reduction" charges.

4. REDUCTION CHARGES (ORE TREATMENT).—These should include all costs from the time the ore is delivered at the mill or reduction works until the bullion or marketable product is obtained, and may be sub-divided to suit circumstances, as, for instance, at a gold mine into:—
   (a) Milling (crushing with stamps or any other appliances).
   (b) Fine Grinding.
   (c) Concentrating.
   (d) Roasting.
   (e) Cyanide Works.
   (f) Slimes Works, etc.

Other metal mines call for special sub-divisions, such as smelting, leaching, etc.

A detail cost sheet should, of course, be prepared for each department.

5. ADMINISTRATION AND GENERAL CHARGES.—Owing to the great variations in items debited to other account the Committee recommend:—

That all possible expenditure at the mine be allocate to the different departments concerned, including suc items as Power (strictly on the basis of units of stea consumed), Stores, Sampling, Assaying, Surveyin Maintenance and Repairs, Native Recruiting Fees, an Salaries of Staff up to and including Mine, Mill o Works Managers, and be spread over the different a counts in proportion to the total expense of each depar ment, so as to show the amount that should properly b charged to it.

"Maintenance" or "Repairs," for instance, shoul not appear as separate primary headings, but should b segregated for the different departments, e.g., min maintenance to be included in "Mining," mill-mainter ance in "Milling," etc., either on the basis of actua shop returns, or in proportion to the labour employed i each department, as is sometimes done.

The Committee recommend that General Charge should, as far as possible, include such items as:—
   (a) Consulting Engineer's and General Manager' Fees.
   (b) Office Staff.
   (c) Stationery, Postages, Telegrams.
   (d) Medical and Sanitary Charges.
   (e) Travelling Expenses.
   (f) Fire Insurance.
   (g) Employer's Liability Insurance.
   (h) Transport, Stabling.
   (i) Local Bank Charges.

6. REALIZATION CHARGES ON PRODUCTS.—These may in clude:—
   (a) Transport to Railway.
   (b) Railway Freight.
   (c) Shipping Charges, Agency and Commission.
   (d) Sea Freight, Insurance, etc.
   (e) Selling Expenses, Returning Charges, etc.

7. PROFIT TAX, INCOME TAX, ROYALTIES AND OTHE TAXES.—An estimated allowance for these taxes shoul be included in working costs.

8. HEAD OFFICE CHARGES.—These may include, in ad dition to expenses inseparable from a Head Office, suc items as:—
   (a) Auditors' Fees.
   (b) Bank Charges.
   (c) Legal Expenses.
   (d) Directors' Fees.
   (e) Office Rent.
   (f) Foreign Agency Expenses and Advertising.
   (g) Interest on Loans or Debentures.

The Committee also think that an estimated averag amount for Head Office charges can in most cases be included with advantage in the monthly cost sheets though it is sometimes thought preferable not to include them in local costs, on the ground that they can only be ascertained at irregular intervals, and are outside the control of the manager on the spot. If not included, this should be stated clearly.

The Committee recommend that all statements as to the quantities and values of stores, ores and products on hand should be certified by the responsible officials, countersigned by the manager of the mine. An independent audit of stores, etc, is advisable from time to time.

The Committee also recommend that annual or semi-annual Reports of Consulting Engineers or Managers, which are usually published, should contain the following information:—

(a) The total Development footage, total expenditure and cost per foot in shaft-sinking, driving, cross-cutting, raising, winzing and platcutting, shown separately.

(b) The total quantity of ore extracted from the stopes of each level separately, when practicable, as well as the ore won in course of development, from all parts of the mine; all of which should be added together.

(c) The total tonnage of ore dealt with, and gold, etc., won, during the year in each separate branch of treatment, with the relative recovery per ton milled and treated in each department; the recoveries to be stated, at gold and silver mines, in percentage and sterling value of "fine" gold or silver, and the cost per ton treated and milled shown as far as possible in each case.

(d) A detailed summary of working costs sub-divided to correspond with the main headings and sub-headings of the cost sheets.

(e) A short tabulated statement of the nature of and expenditure upon new Plant and Equipment, showing sales of old plant, if any.

It is proposed, with the approval of the Council, to le for reference, in the Library of the Institution, copies f working accounts and cost sheets which are in use at arious important mines; and the help of members, with view to making this collection as representative as ossible, would be much appreciated.

In the past, the difficulty in standardizing mine acounts has largely arisen from the fact that Directors r Accountants, and Consulting or Managing Mining ngineers have considered that questions which concerned both belonged to their particular sphere exclusively; ut the Committee hope that the recommendations they ave here formulated, which specially concern their own de of the business in a greater or less degree, will be arefully considered by Directors and Mine Accountnts, and will, as far as possible, be generally adopted y them at mines under their control, and be approved y the senior members of the mining profession.

(Sgd.) A. G. CHARLETON,
Chairman of Sectional Committee "E"—
Mine Accounts and Cost Sheets.

Reciprocity with Canada in Lead.

How It Would Benefit the Idaho Producer.

Written by GEORGE HUSTON.

Lead mining in British Columbia, the province proucing nearly all the lead in Canada, was started by ie hardy American prospector. For a considerable me the ore was shipped to the United States plants r reduction.

Lead smelting, refining and manufacturing owes its stablishment to the high tariff imposed on lead in re into the States and to the effort of the Canadian acific Railway, in its fight against the aggressions of ie American lines feeding the United States smelters. he smelting, refining and manufacturing concerns ad a hard row to hoe for years, but are now in point f equipment, shrewd management, and honest capitaliation, equal to anything on this side of the boundary ne.

Mine labour in British Columbia is paid about the ame as in the Coeur d'Alene region, while smelter labour receives a higher compensation than in any of the plants taking Idaho ore.

The lead production of the Coeur d'Alene region may be classed as custom ore, that is, it is mined for sale to the highest bidder under time contract. The interests of the region are best served when the greatest number of smelting centres compete for the product, and the economic facts governing the competitors are such as to prevent combination. Local smelting is out of the question as we are short the supplementary ores.

The ores of the region are shipped to smelting centres, having need for the lead contained therein, to act as a furnace collector for the values of dry ores, and a single interest dominates the ore purchasing competition. The latter is heavily capitalized, much of it representing nothing but well irrigated good will. The Coeur d'Alene ore production is peculiarly sensitive to this capitalization, as the rates for treatment in the States where the plants are located have been repeatedly lowered, with few or no reductions here. The region is paying an unjust return on an inflated capitalization, to which there has recently been added an alarming increase highly prejudicial to the future of its lead mining. No relief is possible unless competition can be obtained from plants outside of the States, as the monopoly is almost complete.

If the British Columbia smelters could enter the United States market on terms of equality, through a well-considered scheme of reciprocity all through the lead schedules, the monopoly now existent in ore purchase in the Coeur d'Alene region could be broken. It is exactly the type of competition needed to correct the present abuses, and there could be no combination, owing to the transportation policy of the powerful railway system, backing the smelters.

Reciprocity in lead products would tend to stimulate the production of a great tonnage of supplementary ores on both sides of the line, a tonnage now mined in Colorado and adjoining states to go with the Idaho lead ore in furnace work. It would probably put another transportation line into the Coeur d'Alene, while the benefit to the Inland Empire would be very great.

At a convention of miners, held at Lethbridge, Alberta, on February 18, it was decided to ask the Government to have established at different mines, stations equipped with Draeger mine-rescue apparatus.

In the course of a speech he made recently in the Provincial Legislature, in support of a bill authorizing the Lieutenant-Governor-in-Council to grant certain lands near the city of Vancouver as a site for the University of British Columbia, the establishment of which was determined upon several years ago, Hon. Dr. Young, Minister of Education for the province, said: "There will also be in the new university a College of Mining, in connection with which the Government is determined that there shall be secured one of the foremost faculties identified with university work." The Minister also made appropriate reference to the vastness and variety of the mineral wealth of British Columbia, and said that with such a resourceful mineral province, and the best professors to give them instruction, it is expected with confidence this department of the university will turn out, as its graduates, students who will hereafter take their places among the foremost mining men of the world.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

Halifax—The recently issued annual report of the Department of Mines gives the figures of mineral production for the year ended September 30th, 1910. The principal items are: Coal raised (gross tons), 5,477,146 tons; domestic iron ore, 52,640 net tons; pig iron, 341,674 net tons; coke, 493,167 net tons; limestone, 483,100 net tons; gypsum, 322,974 gross tons; bricks, 21,305,500; gold, 10,675 ounces; sulphate of ammonia, 3,622 net tons. The revenue from coal royalty amounted to $554,491.48. The total Mines Office revenue came to $614,576.10.

The Springhill disturbance is still troublesome. It is hoped that the striking miners will be brought to their senses without more violence.

The bill, now before the Legislature, providing for the compulsory use of safety-lamps, will meet with opposition from some of the miners. But the majority, it is believed, especially native-born miners, will be strongly in favour of it.

Mr. Robert Bryce, well known in Cobalt and Porcupine, is actively working several gold claims in Molega. Results to date have been encouraging.

Mr. A. L. McCallum is pushing work on his tin prospect near New Ross, Lunenburg County. Within a few miles of this prospect, Dr. Cain, of Windsor, is continuing work on his manganese property.

Work at Scheelite, Halifax County, is progressing satisfactorily. Mr. Blount, of Ottawa, has assumed direction of affairs. Regular production will be commenced during the summer. A good deal of territory has been taken up adjoining or in line with the original tungsten leases.

The annual meeting of the Mining Society of Nova Scotia will be held in the last week of March.

ONTARIO.

Cobalt—All last month and so far this month, the two power companies supplying air to the mines have been giving inadequate pressure. After the Cobalt Hydraulic had made good the break at the plant at Ragged Chutes, the flow of water, owing to a very severe winter with no thaws, fell to away below normal. Many of the smaller customers had to shut down while the larger consumers are running some of their drills with their own compressors.

Last week the British Canadian Power Company had trouble from the same cause. The Beaver and Temiskaming are working with greatly reduced forces and other properties still using air are operating at much higher cost. An early break up will sa Cobalt operators many thousands of dollars.

An optimistic report was presented at the annual meeting of t Bailey Cobalt by the president, Mr. E. A. Benson. He states th there was on hand and ready for shipment a car of concentrat 143 pounds of nugget silver, and 7 bars of bullion silver. As t Standard Cobalt had settled for its claim of $32,810.23, the was a considerable surplus on hand.

Some good ore was struck in a vein on the Lumsden property Brady Lake at the 250-foot level; but as it appeared to be t top of an ore shoot the shaft was continued down to 400 fe where a level is now being opened up in the diabase.

The Moosehorn, at Elk Lake, is sinking a winze below the 12 foot level on a strong vein of niccolite. The company is also doi a considerable amount of crosscutting to pick up several vei that showed high grade on the surface.

The Devlin property at Elk Lake is now cross-cutting for vei at the 200-foot level. There are three short shoots of good ore the surface. Below, some leaf silver is showing up in one of t calcite veins already cut.

For the month of February the Savage mine of the McKinle Darragh-Savage group made a record, producing 80,000 ounces silver. It is predicted that this property will produce three-qua ters of a million this year.

Some promising indications have been discovered at the 100-fo level of the Green Meehan. A two-inch vein of smaltite giv silver assays and there is some leaf in the wall rock.

At the annual meeting of the Cobalt Lake Mining Company was decided to reduce the capitalization to $3,500,000. The pres dent's statement included a report that the company had on ha $59,343, to which was to be added about $25,000 for a car the smelters. The veins at depth have in the main shown very di appointing values.

The Buffalo has declared another dividend of 5 per cen regular and 3 per cent. extra. When this amount has been pa the company will have disbursed $1,097,000, or 113 per cent. issued stock.

Millerett

At a meeting of the Cobalt branch of the Canadian Minin Institute, Mr. Cyril Knight advanced some very interesting theo ies in regard to the formations as they will be discovered in dee workings in the camp. He declared that according to the dip o the diabase as seen at the Lumsden and other mines where th Keewatin has been cut through, the diabase should give place t the Keewatin again at 1,200 feet. The deduction of Mr. Knigh

Miller Lake O'Brien

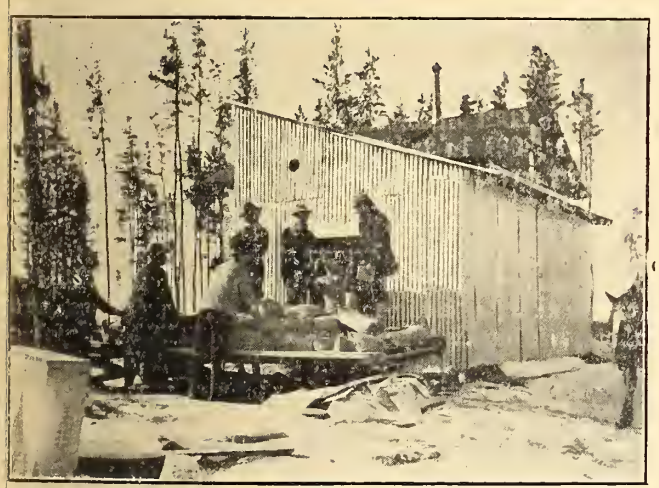
as caused a very lively interest among engineers and mining men
n the camp.

ORCUPINE AND OTHER GOLD AREAS.

It is probable that between four and five hundred stakers
ushed into Bartlett township and the Sudbury division south of
in order to stake round Jim Nelson claim near what is already
nown as Telluride Lake. Nelson has a 20-foot wide vein of
uartz from which he had assays running between two and forty
ollars. The report that gold tellurides were found probably
aused the largeness of the stampede.

It is stated that from the first run at the Swastika's new five-
amp mill nineteen ounces of gold were recovered. The capacity
the mill is between ten and twelve tons per day.

Since their advent into the Porcupine camp Messrs. Bewick,
oreing & Company have shown every disposition to discover the
alue of their holdings as soon as possible. They have taken over



Sacking Ore, Millerett

claims of the Timmins McMartin Dunlap syndicate, all of it
rgin territory. Two six-drill Rand compressors and four boilers
ith complete camp outfits are now on their way in from the
eel, and two camps in north and south Tisdale have already been
tablished. Mr. Hollow, the former manager of the Arroyo-
rownhill mine in Western Australia, will be in charge, with Mr.
illiams, another Bewick-Moreing man, as his assistant, and Mr.
ll Cooper to see to the construction end of the project.

Extraordinary progress is being made with the power scheme at Sandy Falls, where a syndicate controlled by the Timmins is now putting in water wheels and generators. A 36-foot head of water can be obtained and the plant now installed will be able to supply three thousand horse power. It is confidently expected that everything will be ready by June 1.

The Thelma Gold Mines in Bryce township is installing a compressor, three boilers, and a five-stamp mill to treat its ore. The shaft is now down 35 feet.

It is stated that, as an indirect result of the interest in Porcupine, an English syndicate has taken over the Harris Maxwell claim at Larder Lake, and will endeavour to make a mine out of these holdings.

Much interest has developed in northern Whitney as the result of spectacular finds on the Hughes, Mulholland and other claims, nearly all, if not all, on the continuation of the big vein the Scottish Ontario is now working in at a hundred feet.

The Hollinger mine has yet 500 or 600 tons of supplies to get in over the winter road; but all the heavy machinery and the mill equipment has gone over the roads into the camp. The Dome has an even greater tonnage to handle yet. There are over 300 teams in the road; but it is certain that a very considerable amount of the machinery and supplies ordered will have to remain for the railway to haul. Taken as an average, 400 tons per day have been taken out of Kelso yards since the winter roads became good.

BRITISH COLUMBIA.

The new Coal Mines Act has been passed by the Provincial Legislature. A number of amendments were offered by the two Socialist members of the House, who, by the way, respectively represent Vancouver Island constituencies, in which are situated large producing coal mines. Some of these were accepted by the Honourable the Premier (who is also Provincial Minister of Mines), but others were not. Apropos of this measure, Mr. Wm. Blakemore, a well-known coal mining engineer, writing editorially in "The Week," published in Victoria, recently observed, in part: "The Premier as Minister of Mines is to be congratulated on the admirable measure which is now before the House and on the able and exhaustive speech in which he introduced it. It is not a little surprising that a man of so many activities and responsibilities should have been able to acquaint himself to such a remarkable extent with the technicalities of mining and the details of the Bill. 'The Week,' with some practical knowledge of the subject, has no hesitation in saying that when this Bill shall come into force, British Columbia will have the best coal mining laws in the world, not perfect, but perfect as conditions will admit of.

The Bill is conceived mainly in the interest of the miner and for his protection, and if honestly lived up to will tend greatly to minimize the dangers of this most hazardous calling. . . . . On the whole, there can be nothing but praise for an admirable measure, and for the exceptionally able manner in which it was expounded by the Premier.''

In the course of his presentment of his Budget to the Provincial Legislature on February 13, the Hon. the Minister of Finance gave the House some information concerning mining in British Columbia in 1910, taken from the pamphlet issued early in January by the Provincial Bureau of Mines, and to which the CANADIAN MINING JOURNAL on February 1 made editorial reference in kindly and appreciative terms. Later in his speech the Finance Minister said: ''I shall venture to give the following estimate of production of last year, based upon the best available information:

Manufactures	$35,000,000
Mining	26,183,505
Timber	17,160,000
Agriculture	14,399,090
Fisheries	8,000,000
Total	$100,742,595

or an increase of nearly $14,000,000 over the previous year. As actual production is a test of a people's potentiality, we have the largest per capita production in the world. The outlook is promising in every respect.''

The general prospects for mining in the province appear encouraging. Some notes of progress in various districts follow:

CARIBOO—Reports received at the Coast from this district indicate that the outlook for a plentiful supply of water for the ensuing season's gravel washing is excellent, more snow having fallen during the winter of 1910-1911 than in that preceding last season. A larger total recovery of placer gold is, therefore, looked for. Beside an increased yield expected to result from the provision of additional facilities for hydraulicking in Cariboo mining division, it is probable the Quesnelle Hydraulic Gold Mining Company will have its construction work sufficiently advanced towards completion to admit of gravel-washing being commenced about the middle of next summer, in which case there should be an appreciably large addition to the output of gold from Quesnel, in which mining division this company's placer leases are situated.

ATLIN—The quantity of placer gold recovered by the North Columbia Gold Mining Company last season was the largest it has yet obtained from one season's operations. Last season this company worked the property known as the Guggenheims', as well as its own, and it is understood that results from both properties were satisfactory and profitable. The coming season's operations and results may be expected to be larger than those of last year, for the company has an abundant supply of water, and its hydraulicking plant is equal to handling a greater quantity of gravel than has yet been washed in any one season. Other hydraulic operators in this camp expect a good run this year. Lode mining will also have more attention than in the past, and should add to the year's production of gold.

EAST KOOTENAY—The St. Eugene, Sullivan, and Society Girl are the several producing metal mines of this district at the present time. The production of the St. Eugene during the two expired months of the year has totalled about 10,000 tons of ore, which has been concentrated to approximately 1,400 tons of shipping product. The output from the Sullivan during the same period has been a little more than 5,000 tons of ore, shipped crude to the smeltery at Trail. Shipments from the Society Girl are small as yet—only about 250 tons since the beginning of the year. It is expected the yield of placer gold from district mines will be larger this year than for several years, a Vancouver firm of contractors having made preparations for hydraulicking on Perry Creek, in the Fort Steele mining division, and, for the more expeditious removal of the gravel, has put in a steam shovel. With four collieries shipping coal, the 1911 output of this mineral may exceed last year's total of approximately 1,615,000 short tons, gross. A larger production will be dependent chiefly upon (1) continued freedom from labour difficulties, and (2) a sufficient demand for coal to keep the miners fully employed.

AINSWORTH AND SLOCAN—The finding of a new shoot of ore in No. 1 mine, Ainsworth, has been reported. The sale of several mineral claims, also in this camp, took place lately. The Utica, in another part of Ainsworth division, is likely to become one of the most important properties in the district.

In the eastern part of Slocan mining division, development work is being continued at the Lucky Jim, while the Rambler Cariboo is making shipments of ore at the rate of more than 50 tons a week. An important recent development in the last-mentioned mine was the widening of the oreshoot on the 1,050-ft level to 6 feet, practically all ore of high average grade, running 170 ounces of silver per ton. About Sandon, the Richmond Eureka and Hope are the only mines sending ore to the smeltery. Of the properties above Cody Creek, the Noble Five lately sent out a carload of ore for the first time in recent years, development work late in 1910 having resulted in the finding of more ore in this mine. Near New Denver, the Mollie Hughes and Sweetgrass are both being worked, and have recently made small shipments. On Four-mile Creek, near Silverton, the Standard, Van Roi, and Hewitt-Lorna Doone mines are together employing many men. Smelter receipts from the Standard during eight weeks to February 26 were about 300 tons of silver-lead ore, but the output has been small in comparison with the large quantity of shipping ore now easily accessible in the mine. Machinery for the Van Roi concentrating mill is being delivered at the mill site, where the mill building has already been erected. The plant will be put in place as quickly as shall be practicable. Meanwhile production has been suspended, awaiting the provision of concentrating facilities. The Hewitt has shipped between 100 and 200 tons this year, and has beside much ore in reserve. In Slocan City division, ore has been found in the Enterprise lower tunnel, driven by Mr. S. S. Fowler, since he took the mine under lease a few months ago, and the Ottawa has shipped one car of ore. While the total output of ore from the Slocan has not been large for the two expired months of this year, the outlook for the district is distinctly good.

NELSON—The Kootenay Gold Mines, Limited, a company organized to acquire the Granite-Poorman group of mines, is expected to increase the output of gold from these properties, which have been steadily producing for years. A lately published statement was to the effect that during February some $10,000 worth of gold had been received in Nelson from the Athabasca mine. The discovery of a new shoot of ore in the Fern mine has been reported. This mine was well known in past years as a profitable producer. Silver-lead ore is being hauled from lower terminal of the Molly Gibson tramway to Kootenay Lake for shipment to Trail.

The Yankee Girl, at Ymir, is again shipping freely, about 500 tons of ore having been sent out during January and February. The chief value in this ore is gold. The Wilcox stamp mill has been running on ore from that mine and a few hundred tons have been crushed since the beginning of the year. The Emerald, near Salmo, which is the only mine in Nelson mining division shipping ore having lead as its chief marketable constituent, has shipped between 500 and 600 tons this year. In Sheep Creek camp, the Queen and Nugget are the most productive mines, there being little gold coming from other properties in this locality, though several give promise of becoming important producers.

ROSSLAND—The Centre Star group is maintaining an output of 12,000 to 13,000 tons of ore per month, while that of the Le Roi No. 2, including ore milled, is about 3,500 tons, and of the Le Roi approximately 1,000 tons. The Nickel Plate sends an occasional carload of ore to Trail, while two or three other properties make a very small production. The total output from Rossland mines is now between 16,000 and 17,000 tons per month.

BOUNDARY—For some reason that was not published there was a falling off in the quantity of ore shipped by both the Granby and British Columbia Copper Companies during the latter half of

February, but this was probably attributable to temporary disablement of plant or weather conditions. The aggregate production for the district for the two expired months was about 90,000 tons, of which, approximately, 186,000 was from the Granby Company's mines, 83,000 tons from those of the B. C. Copper Company, and 21,000 tons from those of the Consolidated Company. The last-mentioned company is now shipping copper ore to Trail from its Phœnix Amalgamated group, a commencement having been made in February. Prior to this only about 250 tons of ore had been sent out from this property, some eight or nine years ago. The B. C. Copper Company expects to shortly augment the ore supply for its smeltery at Greenwood by 3,000 tons a month from its Lone Star mine, construction of an aerial tramway from which to the railway at Boundary Falls, a distance of 29,000 feet between terminals, being nearly completed. The Granby Company is proceeding to replace, at No. 3 tunnel outlet, the surface works that were destroyed by fire last summer. Several cars of coal have been shipped from the small mine opened near Midway, and another cropping of coal at Meyers Creek, a few miles away, is being prospected. Steel is being laid on the Kettle Valley Railway westward from Midway, and there seems reasonable probability to look for railway transportation facilities being this year provided for the West Fork of Kettle River district, in which are situated several small gold and silver mines.

SIMILKAMEEN—Metalliferous mining in this district, so far as production is concerned, continues to be confined to the Hedley Gold Mining Company's property. Much other development work has been done on various properties in each of several camps, but no production of importance has yet followed it. Coal mining bids fair to soon come into more prominence about Princeton and Granite Creek than mining for any other class of mineral. In addition to that of the Princeton Coal & Land Company, which last year entered upon production on a commercial scale and shipped about 12,000 tons of coal, there are several coal development enterprises, including the Princeton Collieries, the Osoyoos Coal Company, and the Columbia Coal & Coke Company. The last-mentioned has done much development work on its valuable property at Granite Creek, and is preparing to put in plant and other facilities for considerable production whenever railway transportation facilities shall be available, which will probably be within a year.

COAST—At the Britannia mine, Howe Sound, developments are being continued. On Texada Island, the Tacoma Steel Company is maintaining production of gold-copper ore from its Marble Bay mine, while the Tyee Copper Company is developing the Cornell. Reports from Portland Canal district state that there has been satisfactory improvement in regard to quantity of silver-gold ore opened for extraction, in both Nos. 2 and 3 levels of the Portland Canal Mining Company's mine, while at Goose Bay, where the Granby Company is developing, under option of purchase, the Hidden Creek Company's copper mine, both cross-cut driving and diamond drilling have disclosed the existence of more ore than was previously known to be in the mine.

GENERAL MINING NEWS.

NOVA SCOTIA.

SYDNEY, N.S., March 1—Fire broke out this afternoon in the Dominion Steel Company's temporary office in the I. C. R. station. The two upper storeys of the building are already badly gutted.

HALIFAX, February 28—A writ of foreclosure has been issued by the Eastern Trust Company as trustee under a debenture mortgage against the North Atlantic Collieries, of Port Morien, C.B., claiming $930,351 on behalf of the bondholders of the company. This will necessitate the closing down of the mine and throwing several hundred men out of work.

SPRINGHILL, March 1—The first break occurred to-day in the history of the strike which has now extended for twenty months. Twelve of the leading mechanics, who have stood shoulder to shoulder with the strikers throughout the strike, presented themselves at the company's office this morning and were given places in the working staff and two of the active miners also returned to work in the pit.

SPRINGHILL, March 4—Following the riot of Thursday, comparative quiet prevails at the mines. Men are standing in groups discussing the situation, but no disturbance took place. Of the twelve strikers who returned to work at the first of the week, five stayed at home, three of them because they would not face the hostile demonstration to which they were subjected, and two because of injuries sustained at the hands of the crowd.

The charge against Manager Sharp, who was arrested by the town police, was "inciting to riot." The case against him and the other men arrested comes up this morning before Stipendiary Hunter at Springhill.

There will be a requisition for tropps to be sent to Springhill. The force now on the scene numbers 35 men, under Major Grey, and reinforcements are being asked for. The general opinion that further men will not return to work in the mines unless protection is afforded, something that yesterday's events apparently showed, does not exist. The strike has now continued for eighteen months.

HALIFAX—News has reached Halifax to the effect that the suit brought by Phil H. Moore against J. Thomas Reinhardt, broker, of New York, for $250,000, has been decided in favour of Mr. Moore, by the Supreme Court of fthe Unitedetaoishrdlutaoin means the probable early reopening of the Micmac, Jackpot, North Star, and Lincoln gold mines.

ONTARIO.

HAILEYBURY, February 28—The first run on the new five-stamp mill at the Swastika was satisfactory to the management. From 20 tons of ore put through the battery, 19 ounces, 5 pennyweights of gold were saved. This means that the ore runs about $20 per ton. The capacity of the mill is between ten and twelve tons a day.

COBALT—Some 300 feet from shaft No. 122 of the Nipissing, high-grade ore from two to five inches wide has been struck at a depth of 170 feet.

TORONTO, March 6—The British Columbia Steel Corporation, to whom a charter has just been granted by the Dominion Government for the establishment of a $10,000,000 steel plant near Vancouver, has received a communication from the American Car & Foundry Company, in which they signify their intention of establishing large works in connection with the former steel plant.

The British Columbia Steel Company has its headquarters in Toronto, and the exact location of the site has not yet been decided upon, although Port Mann, the proposed C.N.R. terminus, has been under consideration for some time.

The full plant, when in operation, will employ five thousand skilled workers, and have a capacity of nearly 1,000 tons of steel daily.

ALBERTA.

FRANK, March 1—Miners of this district who have been away from work for two weeks on account of differences with the operators, have returned to work under orders from the district president pending the completion of the agreement which is to go into effect on April 12.

BRITISH COLUMBIA.

FERNIE, B.C., March 1—By a large majority the miners at Michel voted to return to work last night, thus clearing the slate of grievances to be considered before going to Calgary to go into negotiations for a new agreement.

The Crow's Nest Pass Coal Company has agreed to install a telephone system in the Michel mines by means of which quick communication can be had with any part of the mines in which ventilation might go wrong. This amicable action upon the part of the men and company clears the way for the Calgary convention which takes up the task of deciding upon a scale of wages and other details which enter into the making of the agreement which is to govern the working of the mines during the next two years.

Trail—The operations of the Consolidated Mining & Smelting Company's smelter at Trail for January make a very favourable showing, according to a statement just issued by the company. During the month the company received 34,500 tons of ore and smelted 32,958 tons. The gross output for the month was about $349,000, of which 58 per cent. of the values was gold.

The January statement is very nearly a duplicate of that for December. In December, 35,000 tons of ore were received and 36,360 tons were smelted. The gross output was $351,000, of which 53 per cent. of the values was gold.

During the seven months ending with January 31, the company has produced about $2,645,000 gross value of metals.

Victoria, March 3—The long vexed question of the restoration of the Kaslo & Slocan Railway has now reached a stage in the negotiations when a definite arrangement is expected within a few weeks. The Great Northern is considering the offer of $25,000 made by a syndicate of Kaslo, who plan to restore the line and either themselves operate it or to secure future operation by the C.P.R. The offer, although the Great Northern regards it as inadequate, will probably be accepted.

Nelson, March 7—Under the weight of five feet of heavily packed snow on its roof, the stamp mill on the Sno Sio claim on Sheep Creek, owned by A. H. Tuttle, of Ymir, caved in on Monday night or yesterday morning. The exact amount of damage done is not yet known, but the loss must amount to some thousands of dollars, even if the machinery is not injured to any extent.

The Tuttle mill had batteries comprising 14 stamps, and at different times in recent history milled ore from the Columbia, the Mother Lode, and the Kootenay Belle gold mines, being practically a custom mill, though most of the ore was milled under lease. The mill site is directly opposite the Kootenay Belle mine, with which the mill was connected by aerial tram, and is on the opposite side of the creek from the mine. At the sessions of the board of provincial water commissioners at Nelson last fall, the water record attached to this mill was confirmed and converted into a license under the new act, though opposing parties asked for its cancellation.

COMPANY NOTES

BUFFALO MINES DIVIDEND.

The Buffalo Mines Company has declared the regular quarterly dividend of 5 per cent., payable April 1; also the customary extra dividend of 3 per cent., payable May 15.

AMALGAMATED ASBESTOS.

The annual meeting of the Amalgamated Asbestos Corporation was held in Montreal on March 8th. The report submitted was for seven months ending December 31, 1910, the date of the fiscal year having been changed. The addition and improvements to plant and property during the 19 months of operation have been paid for out of working capital.

To reimburse the working capital for expenditures made for capital account, the company sold $300,000 treasury bonds at 85, and has arranged for a further sale of $200,000 at the same price. Expenses of management have been reduced by about $47,000 per annum.

Profits for seven months were $195,424.53, against $221,825.33 bond interest and $32,812.50 preferred stock dividend, a deficit of $59,213. From the previous year $93,232.24 was brought forward, leaving the sum of $288,656.77 available to meet the $254,637 charges and preferred dividend. The balance of profit and loss as at December 31, 1910, to be carried forward, was $34,018.91.

Owing to exigencies of the asbestos trade, and as a result of the accumulation of material on hand, the company decided to close its mills and quarries on November 15, so that the income period was practically for 5½ months, although the statement covers seven months.

The general financial statement shows $74,031 in cash, $44,540 accounts receivable, and $900,633 asbestos on hand. Against this are bills payable, $575,922, and accounts payable and interest accrued, $125,782.

YUKON GOLD.

Yukon Gold Mining Company has declared the seventh regular quarterly dividend of 2 per cent.

The dividend is payable March 31 to stock of record March 15. Books close March 13 and re-open April 1.

CROW'S NEST PASS.

The directors of the Crow's Nest Pass Coal Company met on Friday, March 10th, at Toronto, and decided to pay the usual 1 per cent. dividend on March 20th to shareholders of record on March 15th. The stock is offering at 77, without bids.

At the annual meeting it was shown that the total amount available for distribution was $334,950.28, out of which were paid two dividends of one per cent each, making a total of $124,216.

There is carried forward to the credit of profit and loss $210,734, as against $156,025 similarly treated a year ago.

The coal mined during the year amounted to 1,209,762 tons. The coke produced during the year was 194,498 tons. The production of coal shows a steady and satisfactory increase each month over the corresponding months of 1909; the total increase for 1910 being 310,717 tons.

The amount spent on improvements during the year was $144,314.48, as against $215,839.15 the previous year. The amount charged to mine development during the year 1910 was $19,316.29 as against $98,115.37 in 1909, or per ton of coal produced, .0160c in 1910 as against .1091c. in 1909.

HILLCREST COLLIERIES.

At the annual meeting of the Hillcrest Collieries, Limited, the old board was re-elected. C. B. Gordon and C. Meredith were re-elected president and vice-president respectively, and J. M. Mackay secretary-treasurer. This was the first annual meeting, being for a ten-month period.

The secretary reports a considerable cash balance in treasury and the purpose is to spend on plant and equipment so as to put company in a position to double its output in the course of the next six months.

Nothing relating to merger plans was discussed at the meeting.

STATISTICS AND RETURNS

TORONTO MARKETS.

March 9—(Quotations from Canada Metal Co., Toronto):

Spelter, 5.60 cents per lb.
Lead, 3.65 cents per lb.
Antimony, prices unsettled.
Tin, 44 cents per lb.
Copper, casting, 13.15 cents per lb.
Electrolytic, 13.15 cents per lb.

Ingot brass, 8 to 12 cents per lb.

March 9—Pig Iron (Quotations from Drummond, McCall Co., Toronto):

Summerlee No. 1, $23.00 (f.o.b. Toronto).
Summerlee No. 2, $22.50 (f.o.b. Toronto).
Midland No. 1, $20.00 (f.o.b. Toronto).
Midland No. 2, $19.50 (f.o.b. Toronto).
Hamilton No. 1, $18.50 (f.o.b. Hamilton).
Hamilton No. 2, $18.00 (f.o.b. Hamilton).
Clarence, $20,00 (f.o.b. Toronto).
Cleveland, $20.00 (f.o.b. Toronto).

GENERAL MARKETS.

Coal, anthracite, $5.50 to $6.75.
Coal, bituminous, $3.50 to $4.50 for 1¼-inch lump.

COKE.

March 7—Connellsville Coke (f.o.b. ovens):

Furnace Coke, prompt, $1.55 to $1.60 per ton.
Foundry Coke, prompt, $2.00 to $2.15 per ton.

March 7—Tin (Straits), 40.00 cents.
Copper, Prime Lake, 12.65 cents.
Electrolytic Copper, 12.40 cents.
Copper wire, 14.00 cents.
Lead, 4.45 cents.
Spelter, 5.67½ cents.
Sheet zinc (f.o.b. smelter), 7.50 cents.
Antimony, Cookson's, 9.50 cents.
Aluminium, 21.00 to 21.50 cents.
Nickel, 40.00 to 45.00 cents.
Platinum, ordinary, $38.50 per ounce.
Platinum, hard, $41.00 per ounce.
Bismuth, $2.00 to $2.10 per lb.
Quicksilver, $52 per 75-lb. flask.

COBALT ORE SHIPMENTS.

Following are the shipments from the Cobalt camp for the week ending Feb. 24, and those from Jan. 1, 1911, to date:

	Ore in lbs. Feb. 24	Ore in lbs. Since Jan. 1
Barber	6,000	6,000
Beaver	121,276	431,796
Buffalo	62,570	430,700
Chambers-Ferland	64,000	192,900
Cobalt Lake	181,510	562,050
Cobalt Townsite	40,000	289,740
Coniagas	123,740	628,190
Crown Reserve	64,000	340,540
La Rose	63,710	871,130
McKinley-Darragh-Savage	188,080	941,150
Nipissing	65,760	1,388,880
Wettlaufer	60,022	60,022

The shipments for the week were 1,040,668 pounds, or 520 tons.

The shipments from Jan. 1 to Feb. 24 were 8,020,702 pounds, or 4,010 tons.

Following are the shipments from the Cobalt camp for the week ending March 3, and those from Jan. 1, 1911, to date:

	March 3 Ore in lbs.	Since Jan. 1 Ore in lbs.
Beaver	119,717	551,513
Buffalo	63,800	494,500
City of Cobalt	60,000	186,280

Prompt and Satisfactory Returns

The North American Life is continually receiving from policyholders unsolicited letters like the following, expressive of their appreciation of the treatment accorded them and results attained:

The holder of Policy No 8192 wrote:—
"I appreciate the promptness with which you have remitted the amount due me. I may say that I have nothing but praise for your company for the very satisfactory way in which I have always been treated. Our business relations have been very pleasant and I wish the North American Life the future success it so well merits."

The holder of Policy No. 9205 said:—
"I cannot close matters with the company without expressing my great appreciation of its methods and the very fine manner in which I have been treated by its representatives. In the 20 years of dealing I can recall no single instance in which I have received anything but courtesy and business promptness. I hope to renew relations with the North American soon in respect to my children's insurance."

The Financial Position of the Company is Unexcelled.

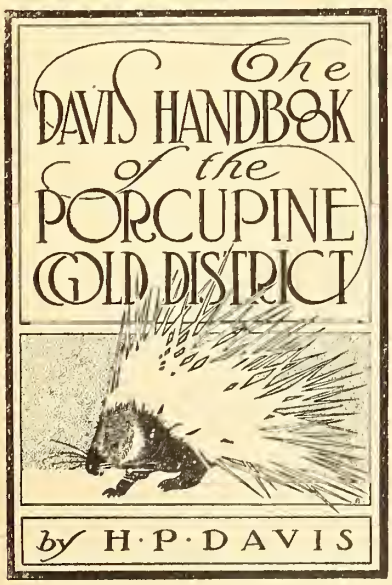
THE DAVIS HANDBOOK



OF THE Porcupine Gold District

THIS BOOK WILL INCLUDE:

A.—An accurate and up-to date map of the Porcupine Gold District.

B.—A brief review of the discovery and development of the Norther Ontario mining districts, including an analysis of the production an dividends of the Cobalt camp to December 31, 1910.

C.—A historical sketch of the discovery and early development of th Porcupine Cold Fields.

D.—An outline of the geology of the Porcupine area.

E.—A description of the important properties so far developed.

F.—A directory of the incorporated companies, giving the date an place of corporation, the head office, transfer office, capital authorize and issued, officers and directors, the location and area of the property equipment, development, etc.

This book will be illustrated with many photographs and drawings, and will b printed on high grade paper with heavy paper or cloth covers. The first edition wil consist of 5,000 copies.

Companies and syndicates operating in the Porcupine Gold District are requested to send full information to the pub lisher. Blank forms will be furnished on application.

Orders sent to H. P. DAVIS, 25 Broad Street, New York, will be filed and notifications will be sent when book i ready for distribution.

Price, Paper Cover, $1.00, Including Map. Price, Cloth Cover, $1.50, Including Map

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

DEPARTMENT OF MINES. GEOLOGICAL SURVEY.

PUBLICATIONS

The Geological Survey has published maps and reports dealing wit a large part of Canada, with many local areas and special subject

A catalogue of publications will be sent free to any applicant. A single copy of a map or report that is specially desired will b sent to a Canadian applicant free of cost and to others at a nominal price. The applicant should state definately the precise area co cerning which information is desired, and it is often of assistance in filling an order for a map or report if he states the use for whic it is required.

Most of the older reports are out of print, but they may usually be found in public libraries, libraries of the Canadian Minin Institute, etc.

REPORTS RECENTLY ISSUED:

CANADA

1085. Descriptive Sketch of the Geology and Economic Minerals of Canada. Accompanied by a geological and mineral map Canada, by G. A. Young and R. W. Brock.

NEW BRUNSWICK and NOVA SCOTIA

1107. Joint Report on the Bituminous or Oil Shales of New Brunswick and Nova Scotia. Also on the Oil Shale Industry of Scotlan Part I, Economics, Part II, Geology by R. W. Ells.

QUEBEC

1077. Memoir No. 7, Geology of St. Bruno Mountain, Quebec, with maps, by J. A. Dresser.

ONTARIO

1059. A Geological Reconnaissance of the region traversed by the National Transcontinental railway between Lake Nipigon an Clay Lake, Ontario. Accompanied by two maps covering the region, by W. H. Collins.
1082. Memoir No. 6. Geology of the Haliburton and Bancroft Areas, Ontario, by Frank D. Adams and Alfred E. Barlow.
1091. Memoir No. 1, Geology of the Nipigon Basin, Ontario, by A. W. G. Wilson.

NORTH WEST PROVINCES

1035. Coal Fields of Manitoba, Saskatchewan, Alberta and Eastern British Columbia accompanied by a map, by D. B. Dowling.
1115. Memoir No. 8. The Edmonton Coal Field, Alberta, with maps, by D. B. Dowling.

BRITISH COLUMBIA

1093. Memoir No. 2. Geology and Ore Deposits of Hedley Mining District with maps, by Charles Camsell.
1139. Memoir 11-T Triangulation and Spirit Levelling of Vancouver Island, 1909, by R. H. Chapman.

YUKON and NORTH WEST TERRITORIES

1101. Memoir No. 5. Lewes and Nordenskiold Rivers Coal District, Yukon Territory, by D. D. Cairnes.
1080. Report on a part of the North West Territories drained by the Winisk and Attawapiskat Rivers, by Wm. McInnes.
1006. Report on a traverse through the southern part of the North West Territories from Lac Seul to Cat Lake in 1902, b A. W. G. Wilson.

MAPS RECENTLY ISSUED:

CANADA

1042. Mineral Map of Canada. Scale 100 miles to 1 inch.
1084. Geological Map of Canada. Scale 100 miles to 1 inch.

NOVA SCOTIA

1019. City of Halifax Sheet. Scale 1 mile to 1 inch.
1134. Map 14 A. Hall Harbour Sheet. Scale 1 mile to 1 inch.

QUEBEC

1112. Map 12 A. Vicinity of the Transcontinental Railway, Abitibi District, Quebec. Scale 4 miles to 1 inch.

ONTARIO

1091. Map 8 A, Lake Nipigon, Thunder Bay District, Ontario. Scale 4 miles to 1 inch.

ALBERTA

1132. Map No. 7A. Bighorn Coal Area, Alberta, by G. Malloch. Scale 2 miles to 1 in.
1117. Map 5A. Topographical map of Edmonton, scale 2.640 feet to 1 inch.
1118. Map 6A. Edmonton. Isobathic lines showing cover over "Clover Bar" coal seam, scale 2640 feet to 1 inch.

BRITISH COLUMBIA

1068. Geological Map (sketch) of the Sheep Creek Mining Camp, West Kootenay, B.C. Scale 1 mile to 1 inch.
1095. Map 1A. Topographical map of Hedley Mining District, Scale 1000 feet to 1 inch.
1096. Map 2A. Geological Map of Hedley Mining District. Scale 1000 feet to 1 inch.

YUKON and NORTH WEST TERRITORIES

1089. Map 9A. Explored Routes on Parts of the Albany, Severn and Winisk Rivers. Scale 8 miles to 1 inch.
1103. Map 10A. Tantalus Coal Area, Yukon Territory. Scale 2 miles to 1 inch.
1104. Map 11A. Braeburn-Kynocks Coal Area, Yukon Territory. Scale 2 miles to 1 inch.

NOTE.—Maps published within the last two years may be had, printed on linen for field use. A charge of 10 cents is made for maps on linen.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon. Letters and samples that are of a Departmental nature, addressed to the Director may be mailed O.H.M.S. free of postage.

Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.

The Michaelsen Ore Crusher and Pulverizer

CHARLES O. MICHAELSEN, owner of Pat. No. 113991 is now prepared to furnish to the mining trade a new device in the line of an **Ore Crusher and Pulverizer.** This Crusher and Pulverizer is unexcelled in capacity, economy of power, economy of labor and repairs, and most essential of all, it accomplishes even pulverization.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals, extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The silver mines of the Cobalt district have astonished the world by their richness, and promising gold discoveries have recently been made in Porcupine Lake.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are: Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows:

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unsurveyed territory, is open to prospecting.

Miners' Certificates good for a calendar year may be obtained by sending $10 00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minimum being 40 acres in unsurveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of $10.00 plus a yearly rental of $1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed territory may be purchased as a mining concession at the price of $20.00 per acre if within 20 miles of a railway in a straight line, or $10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

The Hon. Minister of Colonization, Mines and Fisheries.
Quebec.

A. T. LAING.

143 pages, 6x9, illustrated, $2.00 (8/6) net, postpaid.

A book treating in a practical way all the problems of shaft sinking under diverse conditions.

It has much material on the plant required, various methods of sinking, types and requirements of pumps, cementation, concrete linings, etc.

It is especially valuable *for its data on costs.*

Mr. Donaldson is chief engineer of the Dravo Contracting Co.

CONTENTS

Chapter I.—Some Deep Shafts—Features of Contracts for Sinking—Form of Contract. II.—Plant Required—Boilers, Hoisting Engines, Head-Frame and Bucket Air Compressors. III.—Sinking through Surface—Soft Ground—Wooden Sheeting—Steel Sheeting—Caissons of Steel, Wood or Concrete. IV.—Sinking through Soft Ground—Pneumatic Process—Shield Method. V.—Sinking in Rock—Arrangement of Holes—Tools and Methods used in Drilling—Costs and Speed. VI.—The Sinking-Drum Process—Mammoth Pump—The Freezing Process. VII.—The Kind-Chaudron Boring Process—Cementation of Water-Bearing Fissures. VIII.—Lifting Water—Horizontal vs. Vertical Pumps—Handling Pumps in Shaft—Cornish Pumps. IX.—Shaft Linings. X.—Concrete Linings—Costs per Linear Foot for Rectangular, Elliptical and Quadrilateral Shafts.

370 pages, 6x9, illustrated, $4.00 (17s) net, postpaid.

A treatise for engineers who have to select and use rock drills. It will prove a valuable handbook for all with problems in rock excavation.

Describes first the various types of rock drills in established use, their design and efficiency. It covers further the operation on the surface and underground with valuable chapters on practice in America, Australia and Africa. *It has important data on costs.*

CONTENTS

Preface. I.—Historical Sketch. II.—Standard Piston Drills. III.—Hammer Drills. IV.—Electric Drills. V.—Operating Rock Drills on the Surface and Underground. VI.—Piston Drills Designed to Use Air Expansively. VII.—Philosophy of the Process of Drilling Rock. VIII.—Repair and Maintenance of Rock Drills. IX.—Drill Steel and Drill Bits. X.—Explosives and Their Use. XI.—Theory of Blasting With High Explosives. XII.—Examples of Rock Drill Practice, Africa and Australia. XIII.—Examples of Rock Drill Practice, America. XIV.—Rock Drill Tests and Contests. XV.—Dusts and Its Prevention. XVI.—Notes on the Use of Compressed Air.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver, $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals, or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,57[illegible], the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

MINING AND SCIENTIFIC PRESS

Controlled by T. A. Rickard — Established 1860 — Published weekly
H. Foster Bain, Editor — Thomas T. Read, Associate Editor

In every issue valuable articles are published on mining, metallurgy, and geology, the latest news from special correspondents at the principal mining centers, letters giving the ideas and experience of successful men, and other items of useful knowledge.

THE MINING MAGAZINE
Established September, 1909

T. A. RICKARD, Editor — Published monthly at London, England

A monthly magazine is the natural corollary of a technical weekly. It permits of more deliberate and more extended notice of matters concerning which the news element is less important.

The Mining Magazine includes a review of the world's progress in mining, metallurgy, and economic geology, written by men who have personal knowledge of the regions and conditions discussed.

COMBINATION RATE: To new subscribers to both papers in

	Combination yearly rate

THE

MINING MANUAL

1910

BY WALTER R. SKINNER.

The Standard Reference Work on Mines.

Price 17/- net Post Free (Abroad).

1,500 pages. In demy 8vo, handsomely bound in RED cloth.

The best and most complete compilation of statistics in connection with the mining industry published.

A record of information concerning

MINING COMPANIES
(Gold, Diamond, Silver, Copper, Tin, Iron, and other Mines, Collieries, Land, Exploration and Mining Investment Concerns, &c.)

Arranged in three sections—

Australasian, African, Miscellaneous,

Preceded by Tables of Crushings and followed by lists of Mining

DIRECTORS, SECRETARIES, MINING and CONSULTING ENGINEERS and MINE MANAGERS.

Their Names, Addresses, and Descriptions, and Names of the Companies with which they are connected, and a

DICTIONARY OF MINING AND OTHER TERMS.

THE MINING MANUAL for 1910 contains particulars of over 3,120 Companies arranged in three sections, 315 Companies being AUSTRALASIAN (including Western Australia, Queensland, Broken Hill, Deep Leads, New Zealand and Tasmania); 985 AFRICAN (including Transvaal, Rhodesia, Cape Colony, Natal, West Africa, Nigeria, &c.); and 1,820 MISCELLANEOUS (including Mexico, India, America, Europe, Siberia, &c., and the Coal, Iron, Tin and other Mining concerns of the United Kingdom). The particulars given of each Company include the Directors and other officials; date of establishment; seat of operations; description of the property, with the purchase consideration; plant erected or in course of erection; present working results; ore reserves; details of capital; calls; dividends paid; and the financial position as disclosed by the accounts. Highest and lowest prices of the shares for the last four years, also latest price.

The Index, which forms a highly important feature of the book, contains the names of over 5,300 Companies, consequently active, private or dormant companies can easily be traced.

Crushing tables and Gold Outputs from the principal mines are given at the commencement of the volume, showing tons treated monthly, results obtained, and yield per ton; also annual yields.

Lists of Directors (8,000), Secretaries (1,900, Mining and Consulting Engineers and Mine Managers (1,400) include their addresses and descriptions and names of the Companies with which they are connected.

To be obtained from all Booksellers, or direct from the Proprietor,

MONCTON, N.B.

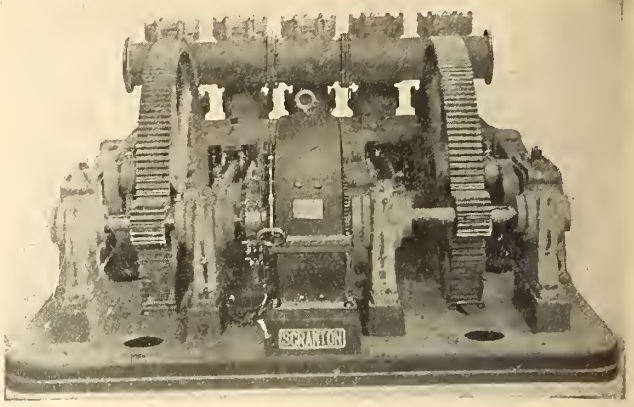
Westinghouse Motors

are driving Mine Pumps in every corner of the Globe.

Reliability is a strong feature of these motors. The mine operator knows that, once installed the motor will do the rest.

It may be made to stop and start automatically. The only necessary supervision being periodical filling of the oil chambers.

A Westinghouse Motor is very much simpler than any steam engine. It has no reciprocating parts; no pistons to wear and require packing: causes no dirt, exhaust steam or vibration, and is always instantly ready for service. The bearings are self-oiling, requiring only occasional inspection.



Westinghouse 200 H. P., 500 Volt Type, "E M" Motor Driving 11 x 18 Quintuplex Pump, 2,000 gal. Capacity, 250-ft. Head.

Send for a copy of Circular No. 1512, it shows Westinghouse Motors driving all kinds of pumps.

Three Post Magneto Electric Blasting Machine

NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

"WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. It does not freeze, or rather, explodes with perfect efficiency when frozen and needs no thawing.

"AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appearance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

PERMITTED EXPLOSIVES for Coal Mines

Nobel Monobel, Saxonite and Carbonite.

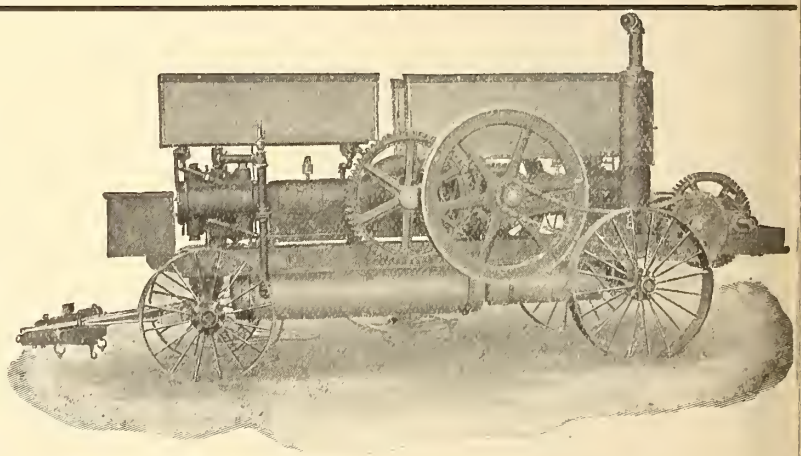
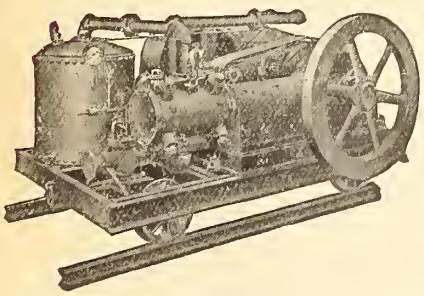
Take Along Some Air!

Air power, and the advantages it secures in drilling, coal cutting and other mining and construction work, can be secured at points remote from a power plant, by means of



Sullivan Portable Air Compressors



The class "WK-2" compressor, shown below, represents a **practical** and **economical** medium for drilling by electricity. It is complete with motor, receivers and chain drive, and is mounted on a steel truck. It will operate several hammer drills, a coal puncher or two, or a couple of rock drills.

The "WK-3" independent road outfit shown above is driven by a gasoline engine. It is useful for preliminary development in rough country, or for any mine or quarry purposes requiring a small quantity of air for short periods at different places. *"Ask for Bulletin 658F."*

Amatite ROOFING

"NEEDS NO PAINTING."

AMATITE means more to the man who needs a roofing than just merely something to put on the top of a building.

It means a thoroughly satisfactory and reliable roof covering, without future *expense for painting* — because the *real mineral surface* makes painting unnecessary.

Frequently the cost of painting a roofing amounts to almost enough to buy a new Amatite Roof.

Amatite can be laid right over shingles, tin or other ready roofings. The directions hold good for laying Amatite anywhere and over anything, and are as simple as A B C.

For further information, booklet, samples, etc., address nearest office.

Everjet Elastic Paint

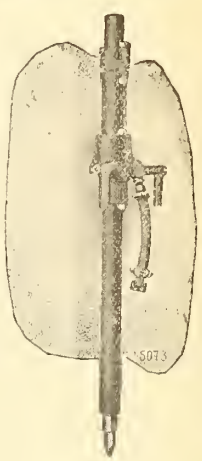
A very tough, durable paint at a low price. One color only—lustrous black. Use it for machinery, heating apparatus, smokestacks, roofs, fences, water tanks, etc.

Creonoid Lice Destroyer and Cow Spray

Cows give more milk if sprayed with Creonoid to keep away the flies which make them restless. The poultry output will be increased if the hen house is made obnoxious to insect pests by disinfection with Creonoid.

THE PATERSON MANUFACTURING COMPANY, Limited
Montreal Toronto Winnipeg Vancouver St: John, N.B. Halifax, N.S.

FOR RAPID DRILLING
IN HARD ROCK



The "B.C. 11" Telescope Feed Hammer Drills are breaking all previous hammer drill records.

This new tool marks an evolution in hammer drill construction. The following are a few of its most prominent characteristics: Low Maintenance costs, automatic lubrication, positiveness and simplicity of valve action, ease of rotation and high efficiency.

The most practical Hammer Drill on the Market.

Why the C.P.R. North Toronto Route to Ottawa and Montreal is the Logical One

The train leaves as follows:

Leave North Parkdale - - -	9.15 p.m.	Leave West Toronto - - - -	9.30 p.m.
Arrive North Toronto - - -	9.40 p.m.	Leave North Toronto - - -	10.00 p.m.
Arrive Ottawa, 6.50 a.m.		Arrive Montreal, 7.00 a.m.	

Daily except Sunday.

¶ The residents of Toronto are adjacent to either North Parkdale, West Toronto or North Toronto stations, same being easily accessible and closer to residential districts.

¶ The North Toronto route is over an hour faster and overcomes a long hill climb for the train obviating any inconvenience and ensuring early arrival at Montreal and Ottawa.

¶ The roadbed has been improved till it is unexcelled in Canada. Practically half the line is double tracked.

¶ The equipment is "Canadian Pacific Standard," a synonym for the "best" and attentive porters, non-obsequious, ensure efficient service.

THE SPRINGHILL STRIKE.

Since the Dominion Coal Company assumed control of the Springhill (N.S.) collieries, there has been little outward change in the situation. The leaders of the strike have rejected the proposals made through the good offices of the Attorney-General, and are still insisting upon recognition of the U.M.W.A. committee.

The proposals of the company were a genuine effort to meet the claims of the strikers, so often and so insistently urged, for a tonnage rate instead of the former method of paying by the loaded box; for an equitable "docking" arrangement, and for higher wages to the lowest paid classes of labourers and boys. It is admitted by all that some method of exercising a check on the stone loaded out with the coal is absolutely necessary, and this is the object of the "docking" clause. The tonnage rates offered are the same as are now being paid to the men at work, who are making good wages, even under the hampered conditions attending operations during the strike. The rates existing when the strike was called were such as to make it impossible to operate the mine without serious monetary loss, and to attempt to continue such rates is merely to court bankruptcy.

Much the same tactics are being pursued by the U.M.W.A. organizers at Springhill as were followed in Cape Breton. A rumour is being assiduously circulated among the Springhill strikers that the Cape Breton miners will strike en masse about the opening of navigation in sympathy with the Springhill men.

There are certain ardent but irresponsible spirits among the members of the U.M.W.A. in Cape Breton who preach strike on every possible occasion, and advocate it as the remedy for all industrial ills, apparently not knowing that the idea of strikes is as obsolete as the prejudice against labour-saving machinery. An example of the methods of some of these men is evidenced by the troubles at the North Atlantic Collieries at Port Morien. Here, although the company had explained to the men that it was in difficulties owing to the winter conditions, the U.M.W.A. continued to harass the management until eventually it was announced that the Eastern Trust Company had been appointed as receivers. In these circumstances the local secretary of the U.M.W.A. wired the Minister of Labour railing against the Industrial Disputes Act in general, and stating that if a Conciliation Board were not immediately appointed, the Port Morien men would strike forthwith. At a time when it was uncertain whether or not it would be even possible to operate the mine on a reduced basis, this threat was not a very terrible one. Not content with such absolute futility, the U.M.W.A. sympathizers are stating that the mine

was mismanaged, and that the foreclosure by the Trust Company was made to prejudice public opinion!

At Port Hood, the U.M.W.A. is harassing a struggling company, and there is not a single colliery in Nova Scotia where the U.M.W.A. has gained any ascendancy that has not either been forced to the wall, or suffered serious financial embarrassment, which, in every case, has recoiled on the miners themselves.

The strike talk just referred to is entirely confined to these professional strife-breeders, and is being circulated with the idea of encouraging the strikers at Springhill to hold out. It is the general opinion that another strike in Cape Breton is the most unlikely thing to happen. As was the case in Cape Breton before the U.M.W.A. strike collapsed there, many of the Springhill strikers would gladly return to their work, but are deterred from doing so by fear of violence on the part of the pickets. The Dominion Coal Company is providing adequate police protection for the men at work, but as the local authorities either are passive or do not desire to prevent intimidation of those who wish to work, there will probably be a repetition of the farcical situation that existed in Glace Bay when the so-called U.M.W.A. special constables were appointed. In Glace Bay the people fortunately saw the humorous side of one set of policemen arresting the others, and a very grave train of possibilities was averted by the good sense of the populace. It is reported that Springhill may be proclaimed as a police district under a special commissioner in order to ensure the preservation of order.

THE COAL MINING INDUSTRIES OF NOVA SCOTIA AND OF WEST VIRGINIA.

Nova Scotian coal operators have a great deal to contend with. In particular they have to compete with the growing West Virginian coal industry, which seeks to absorb the Atlantic coast trade. Or, rather, in the event of any further reduction of coal duties, West Virginia coal will become a very disturbing factor. A glance at the present status of both countries will be timely.

Nova Scotia, throughout the past 125 years, has produced about 100,000,000 tons of coal. Nearly 50 per cent. of this total has been output since the year 1900. The annual output for the current year will approximate to 7,000,000 tons. Roughly, 94 per cent. of this quantity will be disposed of in the markets afforded by the maritime provinces, Quebec, the bunker trade, and Newfoundland. These channels are named in order of importance. The remaining few hundred thousand tons will be shipped to the United States, almost entirely by the Dominion Coal Company.

Turning now to West Virginia, a glance at a recent bulletin, issued by the West Virginia Mining Association, shows us that the total production to date has been almost 600,000,000 tons. Since 1863 the annua coal production of West Virginia has expanded fro less than half a million tons to almost 60,000,000 ton in 1910. This phenomenal growth has been mos marked in the last twenty years. During the two pas decades the annual production has been multiplied b six. As the coal mines of West Virginia are situate between three hundred and four hundred miles fro tide-water, transportation is the chief problem to b contended with. In fact, one writer, Mr. Frank Haa states that fully one-third of the capital invested i West Virginian coal mines is an idle asset on accou of insufficient transportation facilities. Unreliable d livery, Mr. Haas claims, is the prime cause of the lo of large and important contracts. Delivery to th consumer is considerably more costly than the labou of production. Labour is cheap and plentiful. Th number of coal-cutting machines in use is 1,967. Th tonnage of machine-mined coal was 23,362,675 tons i 1910. The proportion of machine-mined coal is stea ily increasing.

Our Nova Scotian correspondent informs us th there are approximately 500 coal-cutting machines i use in the province. The amount of coal mined b machines is about one and two-thirds million ton Nine-tenths of the machines are in use in Cape Bret collieries, the remainder on the mainland. Native l bour is not opposed to the use of machines; but it is difficult matter to secure European miners who a acquainted with coal-cutters.

The disparity in bulk of outputs is most marke Labour in Nova Scotia is costly and not too plentif Climatic conditions limit water shipments to eight nine months of the year. The channels of trade a strictly delimited. Railway facilities are not what th might be. These considerations, whilst they do n cover the whole ground, perhaps sum up the leadi features of the case.

It can be seen that, with Pennsylvania and Oh fuels pushing hard on one side, and West Virginia another, the Nova Scotian operator has ground to fe reciprocity. On the other hand, he has definite a vantages, such as immediate access to tide-water, s cure control of government railway contracts, and t possibility of safeguarding domestic markets by mo considerate treatment of local consumers. But, as West Virginia, so in Nova Scotia, organized and e cient transportation is an imperative pre-requisite. we have said before, right economic conditions wou place Nova Scotia in a position where outside co petition would not imply industrial paralysis. T question is not one of how large a measure of prot tion is needed, but of how soon the artificial barri can be reduced or removed. It would be as grossly u just to disregard the interests of the operator in s tling this question, as it would be to overlook the w fare of the consumer.

THE PORCUPINE BOOM.

Those who have at heart the real good of mining in general and of Porcupine in particular, strongly deprecate the stupid flotations that are now being advertised in the newspapers. When leading business men take an active part in selling to the public a risk that is based upon the opinion of an unauthenticated "engineer," it is high time to call a halt.

The specific instance that has been brought to our attention is the advertisement of Jupiter Mines, Limited. This enterprise is a $2,000,000 affair. 1,500,000 shares are in the treasury, 600,000 shares of treasury stock are offered at 50 cents. That is, the public is being asked for $300,000, which sum, less brokerage and expenses, is to be applied in part payment for two claims on which four veins have been uncovered. The total price to be paid for the claims is $250,000 in cash, along with 500,000 shares. Payments are distributed over a period of nine months.

The report of Mr. James H. Miller outlines the physical basis of the project. Mr. Miller is professionally unknown in Canada. His reports, whilst cheerful, might just as appropriately contain an epitome of the Book of Job. It conveys nothing to the reader beyond the figures of certain assay reports. The "research work" to which Mr. Miller refers has not been made public. We gravely doubt if it ever will. But all the "research work" and all the assays possible on a few outcrops cannot form sufficient ground for warm technical commendation. High assay results do and always will induce men to spend money. But the careful engineer confines himself to facts and not to glowing predictions. However, in justice to Mr. Miller, we must say that he conveys a radiantly optimistic impression in language so selected that he can, if necessary, take back-water in the future.

The claims in question are well situated. How much that implies no one knows. This very fact makes totally unnecessary such decorative features as Major J. A. Murray (whose firm, the Murray-Kay Co., is widely known), Mr. James H. Miller (who is not known), and the incandescent advertisement.

Porcupine does not need the blatant advertisement. Even the scintillating Mr. F. Augustus Heinze can be dispensed with.

The real work is being done by real engineers. Porcupine has struck her gait. Let her not be ridden by the frenzied financier.

REDUCTION OF LOW-GRADE ZINC ORES.

A year and a half ago, at the solicitation of British Columbian mining men, the Dominion Government authorized the expenditure of $50,000 in investigating the commercial practicability of treating low grade zinc and lead-zinc ores. Seven months ago, the Hon. W. Templeman, Minister of Mines for Canada, speaking at Nelson, B.C., outlined the steps that had been taken and touched on the plans that were formed for the future.

These generalities from the Minister are, so far as we know, the only intimation of progress that has been made public since the movement was begun. A year and a half has passed. No doubt progress has been made. But no news has come, not even of the experiments being conducted at McGill University. Kootenay mining men are anxiously awaiting tidings. They know how much hangs on the decision. Suspense is painful and costly.

The intention of those who took the matter up in 1909 was to try to benefit the infant zinc-mining industry of the district during the life of the present generation. We hope that, in the swift passage of the years, this intention will be kept in view.

Meanwhile it is possible that more immediate relief may come from Leadville, where a method of treating ores carrying from 10 to 20 per cent. zinc is being sought. Success is not unlikely to crown the Colorado investigators.

CODIFYING THE MINING LAW.

That the work of codifying the mining laws of the Dominion is being pushed rapidly is good news. The Dominion Government, after hearing the strong representations of the Canadian Mining Institute committee, immediately caused an appropriation to be made and selected Mr. J. M. Clark, K.C., of Toronto, to supervise the drafting of the new statutes. This work will entail a colossal amount of house-cleaning and reconstruction. Mr. Clark's shoulders are broad. He has long specialized in mining law, is the author of a standard text-book on the subject, has had long experience in mining litigation, and is an active member of the Institute. At present he is in correspondence with leading authorities in the principal mining countries of the world. Newspaper despatches indicate that his appointment is acceptable in the west as well as in the east.

Important announcements will soon be made relating to the consolidated statutes. Comments and suggestions are earnestly desired. Our columns will be placed at the disposal of any responsible correspondents. There is no need of emphasizing the desirability of co-operation.

EDITORIAL NOTES.

The many friends of Mr. F. H. Mason, especially his numerous acquaintances in Nova Scotia, will be glad to learn that, after a long rest at San Diego, California, his health is rapidly improving. The article, "Volatile Constituents of Coal," that Mr. Mason contributes to our columns, is thoroughly well done.

Our Quebec correspondent gives in this issue very satisfactory details as to the changes that have recently taken place in the administration of the Amalga-

mated Asbestos Corporation. An earnest and successful attempt to reduce operating expenses to a minimum has been made, and very close attention is being paid to American and European markets. The current year should bring gratifying results.

Mr. John Handley's article in this issue, "Shaft Surveying and New Plummets," is one of the most thoughtful and practical discussions that we have had the pleasure of publishing. The subject is one that is more often neglected than should be. The careful precautions that Mr. Handley suggests are by no means excessive.

CORRESPONDENCE.

STURGEON LAKE GOLDFIELDS.

Sturgeon Lake, Ont., March 11, 1911.

Editor, Canadian Mining Journal:

Sir,—Now that there is so much talk about the Porcupine goldfields, I would be glad if you would allow me to put in a word for this camp.

Though started eight or nine years ago, this camp has never had a fair test. Without prejudice to Porcupine, or to any other camp, I can safely say that this district can show as good surface indications for gold as any in Ontario. The general run of the formation here is northeast and southwest, and is composed principally of diorite, diabase, and schist rocks. Some rich veins have also been found in the granite close to the contact. One sunk to a depth of 12 feet this winter, shows ore in some places going over $500 a ton in gold, besides considerable silver. Quartz veins on the western contact run all the way from 8 to 18 feet wide, and some of them can be traced for over a mile. Most of them show good indications of gold, and where any sinking has been done the values show pretty high. One property, where a shaft has been sunk 36 feet, has a 14-foot vein at the bottom showing an average value of from $18 to $19. The St. Anthony mine, on the same contact, shows high values at over a hundred feet deep. Other veins all over the lake show exceptionally good values, lots of them going all the way from $20 to $90 per ton in gold. The north end of the lake is only three miles from the new Transcontinental Railway, and affords the best of facilities for cheap transportation. What we need here is some practical mining men to take hold of some of the properties and give a thorough test, when I have no doubt it will prove one of the most prosperous gold camps in the country. Most indications show so far as low grade ore is concerned, that the values increase going down.

Hoping you will pardon me for taking up so much of your valuable space. Yours sincerely,

H. Murray Tait.

QUALIFICATIONS OF MINING ENGINEERS

Editor, Canadian Mining Journal:—

Sir,—A flood of prospectuses, similar to that we had during the Cobalt boom, is again appearing in the daily newspapers. The reports contained in these prospectuses are, it is safe to say, signed in the majority of cases by men who call themselves mining engineers but who have not the slightest right to do so. During the Cobalt boom it was ridiculous to see the confidence that the public and the press appeared to had in self-styled mining engineers. One of these men, who did much posing and made many reports was a foreigner, who only a few years before had tramped the country with a pack on his back. Another other was a mechanic with no technical training concerning ore deposits. The list of quacks and fakirs who reported on Cobalt deposits could be extended ad infinitum. A similar class is making reports on Porcupine, and some of our leading financial men are officers of companies which publish the reports of these men.

It is not possible nor desirable that mining engineering should be made into a close corporation, such as law, dentistry or veterinary science. But is it not possible to get the title "mining engineer" or "mining geologist" so defined by Act of Parliament or of Legislatures, that it cannot be used by fakirs in general? The use of this title by such men is with the object of deceiving the public. Could the title not be defined in some such way as the following: (1) Any person using the title of mining engineer, geologist or mining geologist must be (a) a graduate or a university or technical school; or (b) he must be one who has had at least ten years' experience in mining or geology, at least five years of which shall have been in a responsible position. Yours, etc.,

Mine

BOOK REVIEWS.

CANADIAN NATIONAL ECONOMY—The Cause of High Prices and Their Effect Upon the Country—By James J. Harpell—182 pages—Paper Bound—Price 50 Cents—Published by the MacMillan Co. of Canada, Ltd. 1911.

On both sides of the Atlantic the trade relations of Canada and the United States are being hotly discussed. Canadians are being edified by much Parliamentary rhodomontade and by infinite newspaper slush. Strong crusading parties—mostly of the "anti-" stripe—are touring the land. Their intrepid leader, Mr. Clifford Sifton, whose sensational defection from the Liberal party has given him renewed prominence, is throwing all the weight of his prestige into the campaign. All leading manufacturers are with him. With him also is that unrestful person, Prof. Stephen Leacock, master of phrases and epigrams, and worthy wearer of the motley. For Prof. Leacock, when he remains within the bounds of good taste, most of us have large admiration. But from him, as from practically all his fellows, it is vain to expect more than electric sparks. On the Liberal side matters are better—but very little better. The Liberal press is no more convincing than is the Conservative. Both are carried away by

exigeneies of controversy. From neither has the lie received a conseentive and dispassionate pretation of the questions involved.

t is therefore with a sense of relief that we turn to volume under review in which the author has carely digested his facts and has avoided emitting danous elap-trap. Not that we wish to coneur in all . Harpell's eonelusions. This is not to be expected. t we thoroughly approve his eonstruetive attempt set forth Canada's economie eonditions as they ARE, d NOT as our sanguine blindness leads us to HOPE y are.

Whilst we shall pay most attention to the chapter t treats of the mining industry, it will be well to nce over the whole volume.

The nueleus of the book was an artiele, entitled anada and Tariff Reform," that appeared over Mr. rpell's signature in the "Contemporary Review" January, 1910. The ideas there embodied are now forth more eomprehensively. Protracted residenee Great Britain has given the author eertain advanges, and correspondenee with many leading econosts has provided a strong stimulus.

Chapter I. deals with the manufaeturing industries. e fiscal polieies of our politieal parties are here ced, and the influenees that have led up to the overelming growth of our combines are analyzed and lated. The gradual, but inevitable, effeet of high otection, and of its offspring, the trust, upon labour, st of living, and produetion is stated from the viewint of a declared free-trader. Official statisties, rangg from 1871 to 1906, are addueed to show that our nufacturing establishments have diminished in numr tremendously. The effect of this eentralization has en that now "hardly a staple eommodity, whether ported or produeed at home, . . is not eontrolled a few manufaeturers and middlemen." While Mr. rpell perhaps over-aeeentuates the resultant evils, t his general argument is strongly grounded in faet. e tone of this chapter indieates the tone of the reinder of the volume.

In Chapter II. the author seeks to show that our prerential tariff is almost nugatory. The elaim is adnced that with genuine free trade as between Great itain and Canada, many of the most important eomodities would drop 25 per eent. in price.

Chapter III. outlines the nature, methods, and profits our eombines, with especial referenee to their relaon to our banking system. Chapter IV. covers our tural resourees and foreign trade, eompares our adrse annual balanee of trade with the favourable balces of such eountries as the Argentine Republie, and ludes to the absenee of artifieial stimulation of instry in those countries in whieh tariff for revenue ly obtains.

Chapter V., "The Farming Industry," will be eondered the produetion of an alarmist. However this ay be, the facts addueed are too signifieant to be linked. That in ten years our exports of animals, tter, and eggs, have fallen to almost nothing, will me as a surprise to all but the best informed econoists. That our boasted eheese industry is on the wane ill also open many eyes. The presentation of these cts is elear and strong. The eonelusions we shall ave for the reader to diseover himself.

To the mining industry is devoted Chapter VI. The pening proposition is that no industry has suffered ore from high priees and profited less from the conderations that produeed them. The miner has sufred alike from the high eost of living and from the undeveloped home market—a market undeveloped beeause of high protection. This general statement Mr. Harpell illustrates by sketehing the eondition of eertain branches of the industry. Although, in a broad sense, the statement is true, the examples given are forced. For instanee, we do not believe that the falling off in Yukon gold produetion is attributable to any prime eause other than the depletion of the rieh alluvials. Meehanical improvements will bring up the output as time goes on. Politieal maladministration and other faetors have had but little effect in redueing the yield of precious metals. Human stupidity and human eupidity, have probably played larger parts. So also with the iron industry. The laek of well situated, properly developed, iron ore deposits in Canada has been a greater handicap to the industry than anything else. But it is quite eorreet to assert that iron, eoal, eement, gypsum, eopper, and allied branehes of mining, where low eost of produetion is vital, are extremely sensitive to general economic eonditions. The same eannot be postulated of gold and silver. As a matter of faet, Canadian placers and mines show in outstanding instances the lowest costs in the world.

The value of Chapter VI. seems to us to lie, not in Mr. Harpell's analysis, whieh is strained, but in his point of view, whieh is original and most eonduetive of thought.

Chapter VII. is a eoncise, rather meagre, view of the fishing industry. Absence of expansiou is noted.

Chapter VIII. reviews the evils resulting from politieal and fiseal abuses.

Chapter IX. is a forceful plea for national eeonomy. Speeial stress is laid upon the neeessity of reeasting our banking system.

Chapter X., "Reeiprocity with the United States," is a tempting chapter to dwell upon. We must refrain. Suffiee it to say, that it includes a eo-ordinated series of faets, well-authentieated facts, leading up to definite eonclusions. It earries no tinge of party polities.

In eonehding this too lengthy review, let us point out again that, however Mr. Harpell's eonelusions be reeeived, his book is a timely and valuable presentation of statistieal and eeonomie data. This kind of material is edueative. It stands in sharp contrast to the fireworks of the demagogue. It appeals neither to prejudiee nor to passion, but to right and ealm reason. We particularly commend the book in one dose to polemic professors and pyrotechnic politieians.

CORUNDUM.

The United States produees practically no eorundum at present. Canada's produetion, altogether from the plant of the Manufaeturers' Corundum Company, Craigmont, Ont., was 2,692 tons in 1910, valued at $172,000. This is exported prineipally to the United States and Europe. The demand is eonsiderably greater than the present eapaeity of the plant.

Infusorial earth is being used in a number of new ways. In Europe it enters largely into the preparation of artifieial fertilizers, its powers of absorption being particularly useful. It is also used in the manufaeture of water glass, various special eements, glazing tiles, glazing artifieial stone, and in preparing pigments, aniline colours, paper, sealing wax, fireworks, guttapereha, Swedish matehes, solid bromine, papier-maehe, ete. The demand is growing steadily.

SHAFT SURVEYING AND NEW PLUMMETS.

By John Handley.*

The most difficult part of any mine survey is the transferenee of the bearing, or astronomical meridian, to the underground workings. Upon this operation depends the worth of the entire survey. Thus, anything tending towards increased aecuraey will probably be well reeeived by the surveyor.

Though almost universally applicable, my remarks have speeial signifieanee in metal mine surveys. In the ease of the precious metals, the values are apt to be eoneentrated in small veins so that an error of a few feet may beeome important, by reason of the large values involved, if on no other grounds. Moreover, the surveyor is often limited to one opening (which we may assume to be a vertieal shaft), and unless he be provided with an auxiliary teleseope he will probably adopt the two-wire method for establishing his meridian underground.

It is perhaps as well to admit at the outset that mathematieal aeeuraey is physically impossible of attainment even under the most favourable conditions. Where a single opening has to be used the base line is commonly short. When the meridian has been carried underground through only one shaft, or opening, a eheek survey, made through a second opening, and using the first to elose the traverse, will invariably show the original survey to be in error; though this error may be surprisingly small.

In plumbing a shaft by means of two wires carrying suspended weights the assumed eonditions are as follows:—

The weights shall be heavy enough to hold the wires vertieal; they should stretch the wires, and even strain them; the wires shall be equidistant their entire length, parallel to each other, and hang in the same plane.

A philosophical eonsideration of the conditions will show that these two wires should converge, slightly, toward the earth's centre. The practical eonsideration shows, however, sinee the mass of rock has been removed, that the wires will, in faet, diverge slightly from each other, owing purely to gravitational causes. An error is thus introduced at the ontset, but it is so small that it may be ignored in practiee. Nevertheless these eonsiderations are of interest to the surveyor, who aims at the highest possible degree of aeeuraey.

The assumed eonditions are interfered with by a diversity of eauses, and probably defeetive weights are the most produetive source of error.

Many, and wonderful, are the varieties of weights pressed into the shaft surveyor's service; of these we may consider three types:

(a) Iron weights of any kind.

(b) Winged weights.

(e) The improvised weight, as exemplified by the flat-iron, or the window-weight.

Iron weights of any kind are objectionable on the ground that there is always a probability that magnetic influenees, terrestrial or otherwise, may distnrb the assumed eonditions; causing the wires to hang out of the vertical, or in different, sometimes even in varying, planes. When magnetic influences are present the plumb-bobs may attraet each other; or they may repel eaeh other, which is, I believe, the commoner oeeurrenee. It may be argued that an error of this nat will be discovered by the tape measnrements; w should be in agreement with similar measurem made at the surface, near the hangers. These m surements are notoriously difficult to make with requisite degree of aeeuraey sinee an error so s as to eseape detection by the tape method migh vital when read as azimuth angle.

Plumb-bobs having wings of sheet zine fitted slots at their sides are favoured by some survey The funetion of the wings is to bring the bobs qui to a position of rest when hanging in liquids. A tion of apparent rest will eertainly be taken up quiekly when such weights swing in oil or other vi liquid, on aeeount of the large area of resistance fered by the wings. I have spoken of the positio APPARENT REST, sinee sueh position is visual rather actual. Let the surveyor examine the wires at a p say half-way between the hanger and the plumb- In the majority of eases he will find that the wi actually vibrating eonsiderably — in preeisely same way that a taut musieal string will eontinu vibrate for some minutes after it has been struck. musieal string being fast at both ends, such vi tions will be regular and rhythmie. In the ease o shaft wire one end is fast while movement at the o end is retarded, not prevented, by the weight attac Vibration in the wire, therefore, will not be rhyth on the eontrary, the nature and amount of the v tions will vary at different points over the whole le of the wire. This faet may be of importanee sin is eustomary to take off azimnths from the wir various mine levels, so that, eoneeivably, the azim at any two given levels may not be in eoineid Such errors may be negligibly small, in any e there is an element of nneertainty as to their pos magnitude; whieh may be great enough to affect value of the whole survey. The possibility of a erepancy in the azimuths between any two levels, great importanee when it beeomes needful to eo drifts by raising, sinking, or headings.

The resistanee which a viseid liquid offers to winged weights may actually be the eause of e certainly the increased area, whieh the wings gi the plummet, will be proportionately affeeted by currents, or drops of falling water. To sum up case against winged weights; it may be said tha real difficulties arise from the faet that it is al impossible to ascertain how sueh weights will be under any given conditions that may arise in a practiee. The one valuable feature about a wi weight is that it does not revolve freely, and thus ger of the wires breaking by torsion is largely inated.

If aeenrate surveys could be made in spite of th of flat-irons, window-weights, and irregular sh plumb-bobs of various kinds, the fact would not n sarily eonstitute a valid argument for their conti employment. Weights of this elass are the wor all because they do not swing in an ellipse,— 'wobble,''—their motions are irregular and er The vital importanee of this point will be bette preciated if it be admitted that a weight moving ly, through a regnlar orbit, is the most desirable dition for correet work.

*Mining Engineer, Sudbury, Ont.

It will be noticed that plummets, otherwise suitable, but inaccurately turned, or badly balanced, are open to all the objections that may be advanced against the use of irregular-shaped weights.

In shaft surveying time is invariably an important factor, and it is imperative that the work be done with all possible despatch, subject only to the attainment of the requisite degree of accuracy. From the nature of the case the frequent re-checking, possible in ordinary surveys, is not permissible where the main entry to the mine is closed during the progress of the surveyor's work.

In the case of an opening several hundred feet in depth, hours must elapse from the hanging of the wires to the time when it may be possible to begin to take off the azimuth, assuming that the surveyor wishes to "jiggle in," or requires a quiescent wire for triangulating. One single swing of so long a pendulum may occupy minutes. There is a method in use by which the weights are fastened down; even when the correct position of rest can be chosen for the bobs the method is objectionable since it will not do away with the twanging, or vibration, of the wires; moreover, much time is needed even with this method.

For speed and accuracy both, there is nothing so good as a freely moving weight. For the employment of this method the prime requisite is a properly constructed plumb-bob, evenly balanced, and free from magnetic influences. In practice a scale is placed behind the wire, the extremity of the swing in each direction being carefully noted on the scale—it is then only a question of bisecting the longer axis of the ellipse of swing in order to find the correct position of rest for the plumb-bob. It is advisable, space and other limitations permitting, to use two transits and two scales, and by this means bisect both the longer and the shorter axes of the ellipse. Some care is necessary to place the scales at right angles to the line of sight of each transit.

Where a glass diaphragm is used, in the transit, the horizontal cross-hair may have a scale added to it, divided into an equal number of graduations on each side of the vertical cross-hair. In this way the use of scales behind the wires may be avoided, and since the scale forms part of the eye-piece it follows that it must be at right angles to the line of sight; therefore, the possibility of an error in the bisection of the ellipse of swing is reduced to a minimum.

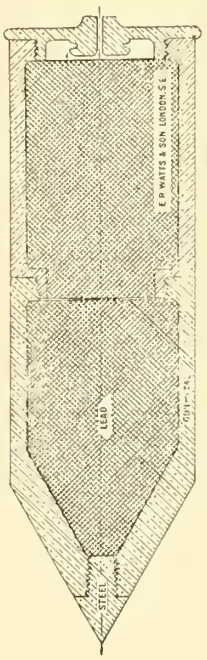
Such micrometer scales are commonly engraved for use with a microscope, and transit makers might, with advantage, be induced to borrow this refinement.

Where spider-webs, or wires, are in use in the diaphragm the scale may be engraved on an extra glass fashioned so that it may be dropped into the eyepiece. Objection may be raised to this method on the ground that such extra lens would reduce the light passed by the eyepiece. Without doubt the point is well taken since illumination underground is never too good; however, without having actually tried the micrometer eyepiece, the idea seems to me well worth consideration.

In the moving wire method it is assumed that the weight shall move through a regular ellipse without deviating or "wobbling." There must be freedom from magnetic attraction; thus all iron weights are barred. When the bobs are suspended in the shaft the wires must be continuations of the true vertical axes of the plummets. In other words, the instruments should be turned in a dead-centre lathe in order to ensure that their points, and points of suspension, are in the same vertical; the weight throughout the plumb-bobs must be regular, and evenly distributed, otherwise these assumed conditions cannot be fulfilled.

Some months ago I found it impossible to procure plumb-bobs of sufficient weight fulfilling the above requirements, and I had such instruments specially constructed. There is nothing particularly novel about these plummets except that they are built in sections (see sectional sketch); they have proved a great convenience in my own practice, and therefore a brief description may be of use to others. They may now be obtained through scientific instrument makers.

The outer tube is of brass, and the filling is lead. A point of hardened steel is threaded into the brass tube so that in case of damage it may be replaced. The cap of the bob is bored to admit the suspending wire, the loose end of which is secured by being wound round a drum fitted inside the cap. In order to meet varying requirements the plumb-bobs are made in sections of ten pounds each. For plumbing a 50-foot winze the 10-pound bob will suffice; for a 200-foot



shaft 20 pounds are required. All the threads are made interchangeable so that plummets of any required weight may be built up by the addition of more sections. In order to protect the points and to provide a convenient means of transportation, leather cases were devised; these are of telescopic form so that they will accommodate one section alone, or a complete 20-pound bob.

The lead filling is run into the brass tubes in a molten condition, and care is necessary that the filling may set in a solid body free from bubbles, or interstices, otherwise the instrument will not be in perfect balance. After the filling is cold it is trimmed off level, and the final adjustment is again made in the dead-centre lathe.

There is a wide variation in the size and kind of wires used in shaft surveying. A steel wire is very much stronger than a copper wire of equal diameter. It is desirable to employ as small a wire as possible since fine wires are easier to line-in on, and are, therefore, more accurate; there is, further, less area for currents of air or drops of falling water to play upon. Piano wire is excellent for many purposes, but if "kinked" it breaks very readily, and, above all, it is difficult to procure.

Soft-drawn copper wire of 18 to 20 gauge may usually be obtained at any time, and even from the smaller hardware stores. I prefer this wire since it may, with care, be repeatedly employed, and a heavy weight will take out any ordinary bends.

The thinnest wire capable of sustaining the required weight, at the particular depth, should be chosen. Allowance must be made for considerable stretch when hanging the weights. If these are to be immersed in heavy oil the stretch will be very materially reduced owing to the buoyancy of the viscid liquid.

Particular attention must be given to the hangers to see that these eyelets are not rough, otherwise the wire will cut. An excellent plan is to ream out the eyelet, so as to allow of its being wound with a narrow strip of lead foil, which prevents the hard metal cutting through the copper wire.

Wires should be lowered on a frame, and the plumb-bobs attached at the bottom of the shaft, allowing the full weight to be gradually taken by the wires. The wires will be preserved, and kinking largely eliminated, if they are wound upon two wooden drums of five o six inches in diameter.

It is good practice to use heavier weights than th apparent conditions seem to demand. The effect o air currents in a shaft is most difficult, if not impos sible, to determine. For instance, the corkscrew mo tion assumed by air rushing up a shaft, will certainl tend to cause the wires to deviate from the true plan An excessive weight would, of course, tend to ove come this action.

In conclusion it remains to be stated that, wherev possible, the two-wire method is to be avoided. Shoul a current of air, or falling water, act only upon on wire, it is readily conceivable that while the distance apart, as recorded by tape measurement, may be in c incidence, the bearing of the wires at the foot of th shaft may be different from their bearing at the su face. In a large number of mine surveys, the two-wi method is the only one open to the surveyor, and whe such is the case the vital necessity for great caution obvious.

THE VOLATILE CONSTITUENTS OF COAL

(Written for the Canadian Mining Journal by F. H. Mason, San Diego, California.)

In his perusal of the journals of the various chemical societies, the metallurgical engineer reads many of the papers—such as "The Optically Active Salts of 4-Oximinocyclohexanecarboxylic Acid, whatever they may be—by title only; but just occasionally an eminently practical paper is found, which he feels many times repays his annual subscription. "The Volatile Constituents of Coal," by M. J. Burgess and R. G. Wheeler, in the October issue of the "Journal of The Chemical Society," is such a paper.

It has long been known by both analytical chemists and coal-mining engineers that the so-called "proximate coal analysis" will give concordant results only when conducted by fixed rules, generally adopted by the profession, and that so light a thing as the substitution of a porcelain for a platinum crucible is sufficient to affect the uniformity of the results. In a word, then, careful research, considerably augmented our know ledge on the subject, and now Burgess and Wheel publish the first installment of a research that they a still conducting. The object of this last investigatio so far as it has gone, has been to find out the amou of gas to be derived from given coals by destructi distillation at various temperatures, and also to di cover the variation in the composition of the gas o tained at different temperatures.

The apparatus they employed was of the simple natnre. It consisted of a platinum tube (fig. 1), clos at one end, the open end was silver soldered into a gu metal flange, having a sunken ring midway between i centre and circumference. The leading-tube, also gun-metal, had a similar flange, except that the ri was raised instead of being sunk. After the coal, co tained in a platinum boat, was placed in the retort, t

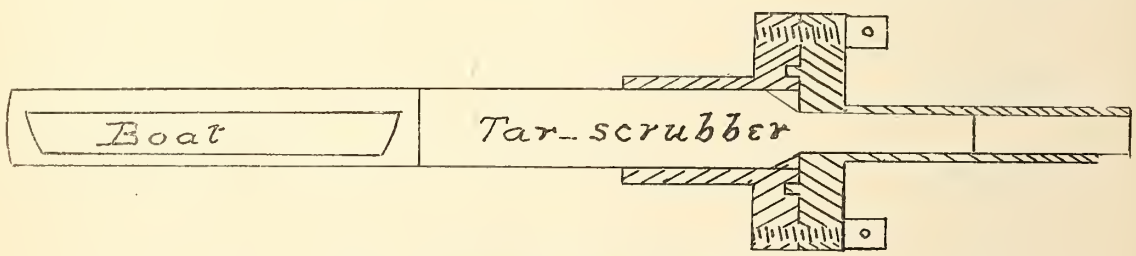


Fig 1. Platinum Retort and Connections.

a "proximate coal analysis" is of value in comparing two coals only when carried out in an exactly uniform manner, and it in no way gives a measure of the amount of gas a coal is capable of producing. The gas engineer, too, is well aware that it is in the earlier stages of the distillation of coal that a gas richest in "illuminauts" comes away. But until recently, beyond such very general facts, our knowledge of the products derived from the destructive distillation of coal under varying conditions of temperature has been lamentably wanting. In 1907-8, H. C. Porter and F. K. Ovitz, of the United States Geological Survey, by a leading-tube was bolted to it, a washer of graphite a asbestos making a vacuum-tight joint. Before maki the connection, a tar-scrubber, consisting of ignited a bestos, contained in a platinum tube open at both en was placed in the mouth of the retort. A stout rubb pressure-tube attached to the leading-tube connect the retort with a mercury manometer, a two-litre g holder, or a vacuum pump; glass cocks, suitably plac intervening, in order that the retort might be connect with any of the foregoing at will. The whole apparat was securely fastened to a wooden support mounted wheels, so that it could be rapidly run into the elect

rnace, that had previously been brought to the temrature of the experiment. The furnace used was a atinum-wound electric resistance furnace, which, with current of a little more than 1 ampere at 200 volts, s capable of producing a temperature of 1,400 dees. The temperatures were taken with a Le Chatelier pyrometer, the thermo couple running the whole ngth of the furnace, and the junction being in the ddle of it. The evolved gases were collected over mixture of equal parts by volume of glycerol and ater, previously saturated with coal gas. This mixre was found to absorb little or no gas and to be ore convenient than mercury. The analyses of the ses were made in a modification of a Bone and Wheeler apparatus. In making the analyses the following reents were used to absorb the various gases, which ere removed in the order named:

Gas.	Reagent.
mmonia.	10 per cent. sulphuric acid sol.
enzine.	Concentrated sulphuric acid.
ydrogen sulphide.	Acidified copper sulphate sol.
rbon dioxide.	Potassium hydroxide sol.
xygen.	Strongly alkaline pyrogallic acid. sol.
cetylene.	Ammoniacal silver chloride sol.
thylene.	Bromine and potassium bromide sol.
rbon monoxide.	Ammoniacal cuprous chloride sol.

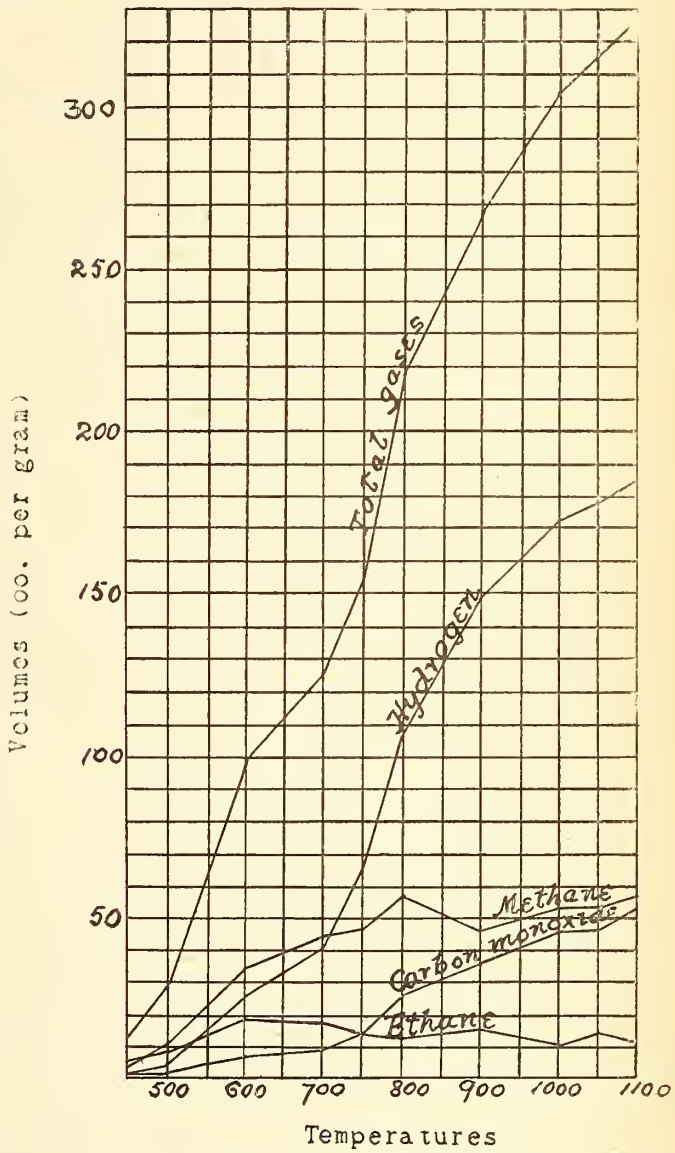
he gases remaining after these absorptions were assed into a set of exhausted glass bulbs, heated over water bath at 90 degrees, containing oxidized palladium precipitate. After ten minutes the bulbs were lowed to cool, and the residual gases were withdrawn means of a mercury pump and measured. The difrence in volume was taken to be hydrogen, which as expelled from the palladium and exploded in the ual way.

In conducting the experiments two grams of carelly sampled coal, pulverized to pass a screen with 0 meshes to the linear inch, were taken for each exriment. In all cases the temperature of the furnace as taken, but special previous experiments, in which pyrometer was placed in both the furnace and the al, demonstrated that the coal attained the temperare of the furnace within two minutes after being aced inside it. The coal, contained in a platinum at, was placed in the back and the tar-scrubber in e mouth of the retort, and the leading-tube attached. he retort was then connected with the vacuum pump d evacuated, then connected with the manometer d run into the furnace, which had previously been rought to the desired temperature. As soon as the onameter indicated that the pressure within the reort had attained that of the atmosphere, the retort as connected with the gas-holder, and the quantity gas that collected noted at stated intervals of time.

The experimenters examined four samples of coal—o bituminous, one semi-bituminous, and one anthrate—with this apparatus, making distillations at a mber of temperatures between 450 and 1,100 degrees. For each coal they give four tables, namely: Rate of evolution of gas at different temperatures; Volatile constituents evolved at different temperares; 3, Percentage composition of gases evolved at fferent temperatures; 4, Total volume of gas evolved r gram of ash-free, dry coal at different temperares, and volume of principal constituents. It will sufficient for the purpose of this article, if we take e of the bituminous and the anthracite coal, give an abridgment of the first table, and a modification of the curve illustrating the last table.

The bituminous coal was taken from the Altofts Silkstone seam, and had the following ultimate analysis:—

Carbon	80.50	Per cent. of ash-free, dry coal.
Hydrogen . . .	5.45	
Oxygen	9.70	
Nitrogen . . .	1.42	
Sulphur	2.93	



Curve showing total volume of Gases evolved per gram of Ash-free dry Coal at different temperatures, and volume of principal constituents.

TABLE 1.

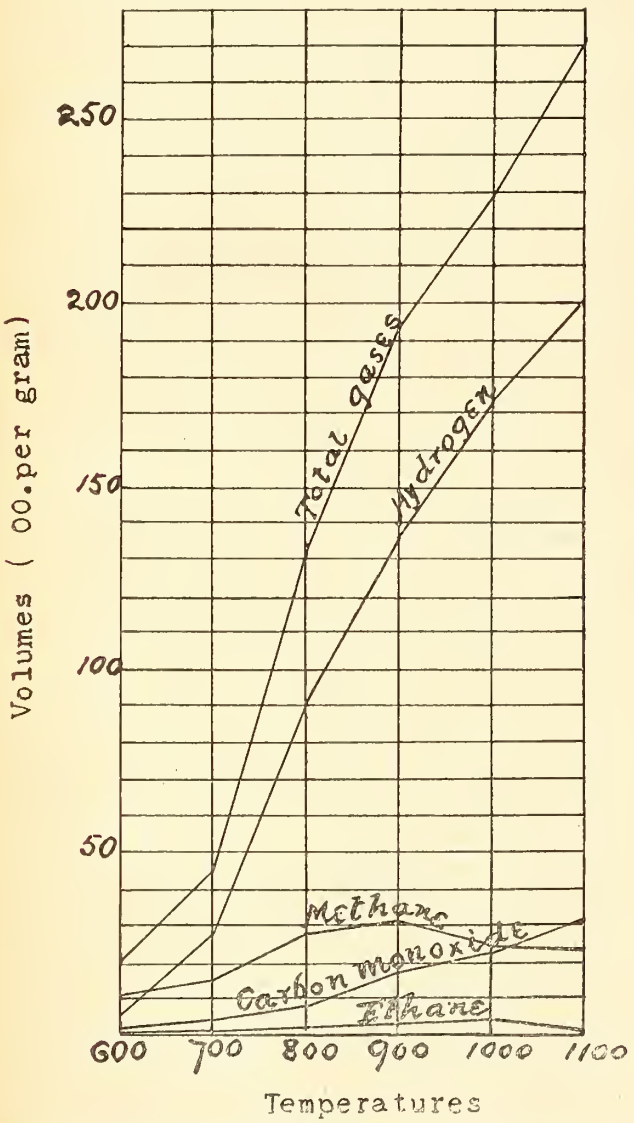
Rate of evolution of gas at different temperatures. Total gas from two grams of coal, measured at atmospheric temperature and pressure:

	Distillation temperature.							
..	600	700	750	800	900	1000	1050	1100
	cc.	cc.	cc.	cc.	cc.	cc.	cc.	cc.
1st minute	40	50	90	145	225	300	375	...
First 5 minutes	95	125	185	300	445	505	515	565
Next 5 minutes	22	30	30	60	50	60	25	30
Next 5 minutes	13	15	25	25	15	15	15	5
Next 15 minutes	25	35	35	27	20	25	15	25
Next 15 minutes	15	10	15	13	15	15	15	15
Next 30 minutes	10	10	5	10	10	25	15	5

With distillations at 450 and 500 degrees, 25 cc. and 60 cc., respectively, were evolved, the total duration of heating being two hours.

The sample of anthracite coal was taken from Pontyberen, South Wales, and had the following ultimate analysis:

Carbon	92.66
Hydrogen	3.14
Oxygen	2.20
Nitrogen	0.99
Sulphur	1.01



Curve Showing total volume of Gases evolved per gram of ash-free Dry Coal at different temperatures and volume of principal constituents.

Table 2.

Rate of Evolution of gas at different temperatures. Total gas from two grams of coal, measured at atmospheric temperature and pressure:

	Distillation temperature.				
	700	800	900	1000	1100
	cc.	cc.	cc.	cc.	cc.
1st minute	..	50	120	250	375
First 5 minutes	15	140	300	405	485
Next 5 minutes	40	50	43	40	15
Next 5 minutes	..	20	10	15	10
Next 15 minutes	20	30	20	5	25
Next 30 minutes	5	10	5	5	15

With a distillation temperature of 600 degrees, 50 c were evolved in two hours.

The great increase in the rate of evolution of hydr gen in all the samples examined between 750 and 9 degrees is of particular interest. In discussing a cau for this, the experimenters are inclined to attribute to a rapid break-down in the higher hydrocarbons the paraffin series chiefly into carbon and hydroge while at lower temperatures they would be more like to decompose into methane, ethane, and hydroge That it cannot be due to decomposition of metha itself, they claim, because, first, the quantity of th gas undergoes very little variation, and, second, has been demonstrated that it is comparatively sta when heated in a porcelain tube at temperatures bel 1,000 degrees. With regard to the latter contenti that the heated platinum of the retort may have act as a catalytic agent to bring about the decompositi of the methane does not appear to have entered in the discussion. To the writer this appears to be point worth investigating. This question, however, the rapid increase of the evolution of hydrogen tween the temperatures named, the experimenters a still investigating. With regard to the large amou of ethane found in the distillate made above 700 grees, this gas, as the authors point out, must ha been generated when the retort was first pushed in the furnace, and swept out with the rush of ot gases, for it has been demonstrated that ethane rapi undergoes decomposition at temperatures below 0 and is incapable of existence above 1,000 degrees.

The principal conclusions the authors draw fr their investigation are: "First, with all coals, whet bituminous, semi-bituminous, or anthracite, there i well-defined decomposition point, at temperatures ing between 700 and 800 degrees, which correspo with a marked increase in the quantity of hydro evolved. With bituminous coals, the increase in quantity of hydrogen evolved falls off at temperatu above 900 degrees, but with anthracite coals it maintained up to 1,100 degrees. Second, evolution hydrocarbons of the paraffin series ceases practica entirely at temperatures above 700 degrees. Th ethane, propane, and butane, and, probably, hig members of the paraffin series, form a large percent of the gases evolved at temperatures below 450 grees."

One dislikes to appear to pick holes in so emine useful a piece of research work, still it is impos to overlook the fact that a large proportion of gases—in some cases more than half, as can be s from the tables—came away during the first mi of the experiment, before the coal had attained temperature of the furnace, where the temperatur the experiment was taken. This difficulty might h been overcome by passing the products of distilla through a long porcelain tube, contained in an elec furnace, previously heated to the temperature of experiment. It would appear, too, that a fracti distillation, in which the fractions coming away tween given temperatures were removed and exam separately, might give more practical information t the massing together of the whole distillate, made ing the rise to and maintenance at a given temp ture, before analysis.

The ore reserves of the Great Boulder Proprie Gold Mines, East Coolgardie, Western Australia, estimated at 750,177 tons of ore, carrying 570,821

(Exclusive correspondence of CANADIAN MINING JOURNAL.)

London, Feb. 18th, 1911.

Mining share investment and speculation in the United Kingdom shows no particular movements of interest and quietness rules in market conditions. Even the fact that the report just issued by the British South African Company (generally known as the Chartered Company) shows a profit for the first time in the company's remarkable history, has failed to move things. This report is a remarkable document for the above-mentioned reason, and it is to be noted that the profits of $115,000 there mentioned have taken twenty-one years to mature. Of course, these profits are far too small to allow of any dividend upon the ordinary shares of the Chartered Company, as they exceed six million in number, of the face value of five dollars each. It is these shares which reached, in the glorious days of Rhodes, Beit and Company and the others, to $40 a share. In recent years their ways have laid in humbler places, their present figure even being no better than $8.50.

Rand descriptions continue quiet, although the news from the Transvaal is generally wholly good. All kinds of interesting developments are taking place. A few of these may be noted here. Petrol locomotives for underground work are being tried at several mines and it is conceived that these may, in view of the shortage of native labour, supply a convenient motive power for small loads. A special petrol engine has been designed for the underground workings at the Crown mines. These trials will be watched closely by mining engineers throughout the world, as in many mining countries petrol can be obtained at a lower rate than on the Rand, and the desire to save labour costs is always with us.

Another point of interest is in connection with shaft sinking through the Rand water-bearing strata. It will be no news to readers of the CANADIAN MINING JOURNAL that the overlying dolomites of the Rand carry very heavy bodies of water. While passing through the water-bearing strata on the Western Rand estates arrangements were made to tub the shaft with a patent overhung tubbing, by which means the shaft as it proceeds can be hermetically lined and kept perfectly dry. This avoids the heavy cost for pumping and permits heavily charged water zones to be passed through. A temporary difficulty was met by an inflow of water, but this has been overcome and shaft sinking is being proceeded with. When the water-bearing formation has been passed through, more solid ground will permit of ordinary sinking being resumed without the necessity of tubbing. On the Far-Eastern section of the Rand, in the Geduld and Springs, a similar inflow of water was encountered.

Two interesting sets of pumps have just been completed for the New Kleinfontein. These are of the three-throw type, each of which will deliver 15,000 gallons of water per hour against a head of 2,000 feet. They are belt-driven from an electric motor and have a set of double reduction, double helical tooth gearing, while the crankshaft, which runs at 41 revolutions a minute, is supported on four bearings. Both suction and delivery branches are so arranged that the pipes may be led off on either side of the machine as may be most convenient.

With regard to the Rand labour question, although there is an increase in the number of labourers offering, the requirements of the mines increase in a still greater ratio. Including the Premier Diamond mine and the collieries, the complement at the end of last year was 276,844 native labourers. This was an advance of over 50,000 labourers on the year, and yet the ratio of employees to complement had fallen to 71 per cent. Developing mines are employing twice as many natives as a year ago and absorbing half the increase in labour. Mortality is very heavy amongst the natives in the mines, especially from pneumonia.

Whilst on the question of Rand mine employees it might be noted here that the assurance companies which issue policies protecting the mining companies from compensation loss through accidents to workmen are finding their business very extensive on account of the tendency of the Transvaal courts always to give the claimant the benefit of any doubt. At present the insurance is being underwritten for a premium of 2 per cent.; it will probably be increased to 3 per cent., and the risk in connection with building has so increased that the building premium will be raised from three-eighths of one per cent. to one and a half per cent. A very large proportion of the compensation risks of the Rand mines is covered by a mutual insurance company in which the employing companies are interested, and which does not seek to make profits. It seems that if it did so seek it would be grievously disappointed.

The attempts that have been threatened from time to time to introduce legislation restricting or abolishing Sunday labour on the Transvaal mines have been thrust in the background for the time being by the fact that the new draft mining regulations contain no vital alteration with regard to Sunday work. It seems clear that the finances of the Union Government of South Africa are in so indifferent a condition that the authorities could not see their way to bring about what would be a serious reduction in the revenue derived from the mining industry.

Although West Australia shares do not show much life on this side, despite the fact that an important market here is devoted to them, and although we have seen nothing of the threatened Bullfinch boom here, all the news from Australia is full of the fame of Westralia's newest goldfield. D. L. Doolette, the Bullfinch finder, a member of the famous Westralia mining family, is on a visit to this country, and has been telling the story of the discovery. Doolette and a colleague, Shallcross, following a prospector whom they had sent on ahead, secured a substantial claim in the Southern Cross district of West Australia. Fine pannings resulted, but the indications were such that the two men did not think the show big enough for them both, and they decided that one should sell out to the other for $5,000. Doolette was the lucky buyer, and almost immediately afterwards indications improved and the value of the mine could hardly be estimated. Doolett in his interviews modestly passes over the fact that he

promptly gave his colleague a sixteenth interest in the mine instead of the $5,000 which had been arranged. Some of the ore run into carried gold up to 25 ounces to the ton, and when it got into Kalgoorlie for treatment the boom set in and men from all over Australia hurried to Southern Cross. The twenty miles of road from Southern Cross to Bullfinch was crowded. Pegging took place for sixty miles of country from Golden Valley, thirty miles north of Southern Cross, to Parker's Range as far south. In a very few weeks there was not an acre of timber, salt brush, or granite country that had not been taken up. Of course, the outlying properties had no intrinsic value and were probably only secured in order to be sold to the later option seekers who afterwards thronged the district. Between June 22nd and December 17th, the Bullfinch property produced gold to the value of over $215,000.

Australia's gold industry celebrated its diamond jubilee in the second week of February this year. In that period over $2,600,000,000 worth of gold has been won, and these recent developments in Western Australia point to even more remarkable finds in the future. Despite the fact that wool growing has brought more wealth to Australia than all the minerals put together, the gold industry has always exercised the greatest fascination over the public mind. The name of the actual first finder of gold in Australia will never be known. The Dauphin Chart, dated 1530-1536, which is preserved in the British Museum, contains a land to the south of Java, which is thought to represent Australia, and its northwest coast is called "Costa d'Ouro," or "the Gold Coast." Coming down to known fact, however, it is recorded that a New South Wales surveyor named McBrien, found gold near Bathurst in 1823, but no steps were taken to work it. In 1839 Count Strzeleeki, the Polish explorer, reported a discovery of gold to the Governor, but at his request kept the matter secret. It was feared in official circles that economic conditions in the young colony might be disturbed by a gold rush.

That this fear was well founded was shown by subsequent events. The facts prove that Australia is one of the greatest gold-bearing countries of the world. An additional fact, often lost sight of, is that she is also a country a large portion of which has never been geologically explored. The cursory examinations of the Northern Territory made so far by geologists and prospectors indicate that the mineral future of that enormous province of half a million square miles is on the knees of the gods. Practically every precious and semi-precious metal is known to exist in the Territory, and it would be no surprise to those who know the country if it should eventually become one of the world's richest mineral areas. A proposal has received the consideration of the Commonwealth Government—which recently took over the administration of the Northern Territory—for a commission of scientific experts from the universities of Australia to make a tour of exploration through the Territory, which would greatly increase the general knowledge as to its mining possibilities.

Coming back to British and European matters, some interesting facts have been arrived at with regard to the cost of winning coal in the chief European producing centres. The average cost per ton rules highest in Belgium and France, where it is 16.14 francs and 15.95 francs respectively. England comes as one of the cheapest countries, at about two-thirds of these costs. During the past twenty years the price of mining coal has substantially increased all over Europe. In Wales, Belgium and Westphalia, between 1886 and 1907 it more than doubled. The increase has been least France. One of the reasons given for this augmentation in cost is the diminishing daily output of the coal getter. The range of time covered is not so great, but it appears that whereas in 1899 the English coal min who, by-the-by, headed then and still heads the list f output per man, turned out 311 tons of coal. T figure had shrunk to 279 tons in 1908. Belgium is the bottom of the list with a fall in output per m from 173 tons to 160 tons.

It is urged that in the United Kingdom recent leg lation in restricting operations to an eight-hour d in our mines has also had an adverse effect both the quantity of coal produced and in the cost of p duction. It has led to a speeding up in many collier and to the discharging of many of the older min who were unable to put in the amount of work in t reduced hours, and to an increase in mining risk the miners.

Apart from the result in curtailment of coal c sumption by the rise of oil fuel, there is a midw method in operation whereby oil is mixed with c on railways and other works. A large colliery own in this country has just declared that he has tried admixture of oil in coal on his own line and in his o works and finds a large economy as a result.

The direct competition of oil with coal in Eur is emphasized in a report issued by the Petrows Commission in favour of replacing coal by fuel oil the Russian State railway system. This has cau something like consternation in the Donetz coal d trict, for almost 30 per cent. of their entire output now taken by the State railway authorities. It not thought possible that the change from coal to can be anything but a gradual one, for any other pol would press with great severity on the workers. Pri of coal have fallen as a result of this report, and p ducers assert that they are now below profitable lev It is quite certain that Russian coal producers are fi ing the oil competition difficult to meet, and ma manufacturers, attracted by the exceedingly low ra at which heavy oils are being offered, have adop this system of firing, and have contracted for supp to cover their 1911-12 requirements. Instances of c tracts covering 1913 are mentioned.

It is very clear that a new oil boom might br out at any time upon the least provocation. The n ber of new oil ventures waiting to make their ap for capital to the public is considerable and every centre of the world is drawn upon. The Maikop f will, of course, be responsible for many, while renew attention is being paid by the promoters to Gali Cuba, even, is coming into favour. Even that far-a corner of the British Empire—New Zealand—produ testimony to the value of oil fuel. Upon the State r ways there the fuel used is crude petroleum contain about 40 per cent. of kerosene and benzoine. The p to the railways was eight cents per gallon. In on the tests the fuel kept its end up by maintaining spe steam on a locomotive pulling at least 200 tons fo miles, generally uphill, at a satisfactory rate and w out the least hitch.

On account of unwarranted reduction of work costs in 1909, many Rand mines have been forced bring up their expenditure largely during 1910. A age costs for 1909 were 17s.3d. per ton; whilst t for 1910 were 17s.8d. Individual mines, of cou greatly exceeded these figures. The average pr per ton for 1909 were 11s.7d., and for 1910 only 1

Valedictory Banquet to W. H. Aldridge.

The valedictory banquet given at Trail, British Columbia, on February 20th, to Mr. Walter H. Aldridge, who on January 1st retired from the position of managing director of the Consolidated Mining & Smelting Company of Canada, Limited, was an unique event, for no other occasion has there been such general and widespread expression of appreciation of the value of the services of any one man in promoting the best interests and extending the operations of the mining and metallurgical industries of the southern interior of British Columbia.

In the JOURNAL of February 1st were given brief particulars of Mr. Aldridge's retirement, and the chief reason for it, namely— to quote Mr. Aldridge's own words: "in order to enable me to become associated with William B. Thompson, of New York, who is a director of several of the largest copper-producing companies of the United States, and who, with Gunn, Thompson & Company, has control of a number of the leading copper mines of Arizona and Nevada." At the same time there was given, too, a short account of Mr. Aldridge's career as a mining engineer and metallurgist from the time he left the Brooklyn Polytechnic in 1883.

The banquet at Trail was largely attended by a most representative assembly, comprising men chiefly from various parts of the Kootenay and Boundary districts, with which Mr. Aldridge's activities had been numerous and important during the comparatively long period of twelve or thirteen years throughout which he was intimately associated with the development and expansion of mining and smelting operations of a part of the province, the ore production of which has reached an annual tonnage in excess of 2,000,000 tons, and the total output of which last year was about 1,500,000 short tons. Beside this influential gathering present to do honour to Mr. Aldridge, there were many others who, by letter or telegram, intimated their regret at the departure from the province to other scenes of activity, and joined in the unanimous expression of goodwill and best wishes for the continued success of the guest of the evening. Among the large number from whom felicitous communications were received were the Hon. Richard McBride, Premier of British Columbia (who is also Minister of Mines for the province); Hon. Wm. Templeman, Dominion Minister of Mines; Mr. R. W. Brock, Director of the Geological Survey; the members of the Provincial Legislature (then in session) representing the mining districts of the southern interior; the president of the Consolidated Mining and Smelting Company of Canada, Toronto; many mining engineers and metallurgists; two judges of the Supreme Court of British Columbia; prominent Canadian Pacific Railway officials, and others too numerous to mention. Communications appropriate to the occasion were also received from the Canadian Mining Institute, Montreal; the Western Branch of the C.M.I., British Columbia, and the Toronto Branch of the Institute.

The following address was presented at the banquet:

"Mr. Aldridge: This gathering and these few expressions evidence in a simple way the great good-will which the people of the Kootenays, the men of the Consolidated Mining and Smelting Company of Canada, your associates, and your friends, entertain for you, in retiring from the active direction of the mining and smelting interests which have been in your charge for the past twelve years, the sentiment is general that not only the mining districts but the whole province of British Columbia is losing a capable, conscientious, and faithful advocate of the country's welfare.

"The desire to show recognition of the signal services you have performed in the development of the vast and varied resources of the province, does not constitute the only motive for admiration and respect. Consistency of character, and a uniform regard for the welfare of employees, coupled ever with evidences of fairness, courtesy, and high-minded principles, have commanded a confidence and esteem which promoted the pleasantest relations and insures for you always the kindliest recollections. In the success of all engagements and the achievement of every ambition you have the earnest and cordial following of a host of well-wishers who appreciate you as an executive, admire you as a citizen, and honour you as a man."

Before reading the foregoing address, the chairman said, in giving the toast of "Our Guest": "Gentlemen: In proposing the toast to the guest of the evening, I do so with mixed feelings, pleasure and regret; pleasure, because there is no man deserves the honour more than the guest of this evening; regret, that we in British Columbia are losing a man of Mr. Aldridge's standing in the mining and smelting world. This province can ill afford to lose such a gentleman as the guest of this evening. We admire him not only as a successful mining and smelting man, but as well as a good, broad-minded citizen and a thorough gentleman, a man whose word is as good as his bond. But we are not selfish in our regret, so we are met here this evening to bid him God-speed in his new field of labour, and wish him every success in all his undertakings. When Mr. Aldridge came to the Kootenay, some thirteen years ago, mining and smelting were at a low ebb, owing to the high rates for freight and treatment of ore. The Le Roi mine was forced to build its smelter at Northport, Wash., and we, in Trail at any rate, felt that our sun was darkened. But Mr. Aldridge came along then and took hold of the smelter at Trail, and through his energy and business ability, freight and treatment charges were reduced by about one-half. A few years later he formed what is known as the Consolidated Mining and Smelting Company of Canada, Limited. It was through his ability and the high respect in which he was held in the financial world, that he was enabled to form this company. To-day the company not only has mines at Rossland, but in nearly every camp in the Kootenay and Boundary country. We have here in Trail one of the largest smelters in Canada, and the only refinery of its kind in the Dominion. This, gentlemen, is part of the work of the guest of this evening, but this is not all. During all these years he has had no serious trouble with any of his employees. Why? Because he was always ready to meet them in a fair and generous spirit, and treat them as men. But while he is going away from us, we are glad he has not altogether severed his connection with the Consolidated Mining and Smelting Company, and I am quite satisfied that those upon whom his mantle has fallen will in the future carry out his policy."

After the toast had been enthusiastically honoured, Mr. Selwyn G. Blaylock, assistant manager of the Consolidated Company, on behalf of the company's many employees, presented Mr. Aldridge with a magnificent service of silver plate. They had desired, Mr. Blaylock said, to give Mr. Aldridge something that would express their esteem for him and, also, that could not be duplicated elsewhere. This had been accomplished through this service, which was manufactured from sil-

ver mined in the Kootenay and refined at Trail.

Mr. Aldridge, in his response, first suitably acknowledged the honour done him and the great kindness his many friends had shown him. Following this he said there was one thing he felt he could fairly take credit for, namely, in having got together in the company's employ the finest and ablest lot of young men he knew of working anywhere. Referring next to the men employed at the company's mines and smelting works, he observed that the Lemieux Act was designed to give employer and employed a rest, but he could say with pride that not a property of the Consolidated Company had stopped work for even a day by reason of labour troubles. He had always found the labour leaders in this territory able and reasonable men. Regarding the outlook for mining, he remarked that in many parts of the country promising indications of the occurrence of copper ore had been discovered, and he looked for a great future for the copper mining industry of the province. He spoke of the days when the War Eagle mine, at Rossland, had been supposed to be worked out, but since it had passed into the possession of the Consolidated Company it had become the greatest producer the company had ever owned. At one time, though, there was only three months' ore in sight, but mines sometimes were able to come back as this one had done. After speaking of the new duties he had undertaken, and the great productiveness of some of the mines with which he will hereafter be connected, Mr. Aldridge said that before leaving British Columbia he would like to make a few suggestions. Certain of the western States were founded through the mining industry. Then had come the agriculturist to supply the wants of the miner, and then the manufacturer. These States are now in a position where, if the mining industry ceases to exist, they will still be prosperous. For similar reasons mining in British Columbia should be given every encouragement, for it opened up the province. The St. Eugene mine, at Moyie, for years had not paid a cent to its shareholders, and the Centre Star War Eagle mine at Rossland, which is the Consolidated Company's best property, is paying to the Government a comparatively large proportion of its profits, and yet is not paying dividends to its shareholders. He advocated a reduction of the mineral tax from two per cent. to one-half per cent. A second suggestion was that measures should be taken to prevent large numbers of mineral claims being held by men who do not work them, but who are only required to pay $13 a year taxes on each. Every man holding a claim should be compelled to develop it. A third suggestion was that the law of eminent domain should be adopted in principle, so as to debar, for instance, some of the occurrences in certain states, where a man owning a few acres of land and employing, perhaps, one Chinaman, was able to cause the closing down of a mine employing thousands of men.

The Nelson "Daily News" has published a lengthy report of the evening's proceedings, and from that has been taken the information given above. Space limitations prevent further quotation except to make brief reference to an address from the company's Italian employees, read by one of their number, and a speech by one of the Rossland miners. The former expressed —as the reader said, quite inadequately, being in English—the sentiments of those who presented it, which were expressive of esteem for Mr. Aldridge and great regret at his departure. The latter was as follows:

Mr. Rupert Bulmer said no higher tribute could be paid to Mr. Aldridge than the loyalty of the men who had worked for him. He would be assured of success in his new sphere, for he would command equal loyalt from his men there. He had assembled a splendid sta of young men, and the administration of the affairs the Consolidated Company's properties had fallen upo the shoulders of a young man (Mr. R. H. Stewart), whom Rossland had complete faith. As long as th employers met their men in the open spirit which M Aldridge had uniformly employed with his men, the would find union men ready to meet them half way. O behalf of the Miners' Union of Rossland he wished M Aldridge God-speed.

Discussion

Of Paper by John Stansfield on "Microscopic Exan ination of Some Typical Speciments of Porcupine Rock and Vein Matter." C. M. J., Feb. 15, 1911, p. 109.

The descriptions of the rocks and ores from the V pond mine, show these specimens to have characte in common with those from other parts of Tisda Township. It is noteworthy that while the wall roc of different deposits are of many different rock type they have all been so altered by secondary process to carbonates, that it is almost certain that they hav been acted upon by solutions which emanated from th fissures later filled with gold-quartz. As Mr. Stan field points out, the quartz veins are in most cas younger than the carbonates. The carbonates ar however, not all in the form of veins; but form replac ment deposits in altered rocks, and the quartz vei are clearly younger than the carbonates which enclo them. The relation of the quartz to the carbonates well illustrated on a large scale by the Foster lode, which photographs have been shown in this journa A similar relation for minute quartz veins is found microscopic examination.

It is well to point out, however, that as Mr. Stan field notes in some of his specimens, there are so carbonates in the quartz which are younger than th carbonates in the wall rock and younger than most the quartz. The younger carbonate, moreover, is n the same as the older. In some specimens from th Dome mine it is apparently calcite, while the carbo ate in the wall rock is ferrodolomite.

The character of the quartz at the Vipond is ev dently like that of other deposits, largely made up coarse grains full of inclusions and showing strain effects and in less degree of fine grains which have be produced partially by crushing, aided by solution an recrystallization. These finer grains are then young than the coarse, as are also the small particles whi were not so evidently formed from neighbouring quar grains, and which may have been deposited from sol tions coming from some distance.

The character of the veins and the abundance carbonates strongly suggests that the solutions whi altered the country rocks and deposited the gol quartz were hot and contained constituents common molten rock magmas. It is reasonable to suppos therefore, that the solutions rose from an igneous ma ma which was intruded into Keewatin and Huroni rocks. The rock mass has not yet been located. It m underlie the deposits at considerable depth and n where reach the surface, or it may outcrop at so distance from the deposits.

Houghton, Feb. 25, 19

CANADIAN TELLURIUM-CONTAINING ORES.

D. D. Cairnes, Ph.D., Ottawa, Ont.*

(Annual Meeting Canadian Mining Institute, Quebec, 1911.)

INTRODUCTION.

During the past few summers the writer, while employed in northern British Columbia and southern Yukon, has had occasion to examine a number of quartz veins that contain rich ores in which various tellurides occur; and since tellurium-containing minerals seem to be particularly attractive to the prospector and are of somewhat rare occurrence, it is thought that, possibly, a brief description of these veins together with a compilation of some of the main, available facts concerning other known Canadian ore-deposits in which telluride minerals occur, may be of interest to members of the Canadian Mining Institute. Tellurium occurs as native and in composition with sulphur, selenium, bismuth, gold, lead, mercury, nickel, and silver, yet the tellurides are the only mineral-compounds of gold that are known.

Minerals.

The following tellurium minerals have been found and identified in Canada:—

Sylvanie, (Au Ag) Te.
Hessite, Ag_2 Te.
Petzite, $(Ag, Au)_2$ Te.
Calaverite, $Au Te_2$.
Nagyagite, a sulpho-telluride of lead and gold, containing about 7 p.c. of antimony.
Altaite, Pb Te.
Tetradymite, approximately Bi_2 (Te, S)$_3$.
Tellurite, (Tellurie ochre), $Te 0_2$.

In addition, a mineral thought by Dr. Hoffman[1] to be native tellurium, was found at Long Lake, Greenwood mining division, British Columbia.

Oxidation.

All these tellurides oxidize readily and give rise mainly to tellurie oxide, tellurites or tellurates with bismuth, iron, and probably mercury, and native gold, silver, also rarely, bismuth; the tellurie oxide, also known as tellurite and tellurie ochre, in its pure state is a soft (1.2) white to yellowish mineral, but generally occurs mixed with other oxides, frequently those of iron, when a yellowish to reddish powder or coating results.

Mineral Associations.

With the exception of tetradymite, these minerals occur in Canada only in veins which may have been produced either by fissure filling or by metasomatic replacement or may owe their existence in a large degree to both agencies. The veins are found in a great variety of formations, including various schistose rocks, granite, granodiorite, diorite, andesite, volcanic breccias, quartzite, slate, shale, and arkose; but with but one known possible exception they are all either in, or in the vicinity of, igneous rocks. In all cases, so far discovered, the veins consist predominantly of quartz, calcite, and, rarely, ankerite and sericite occur as gangue minerals. Several varieties of tellurides are in many cases intimately associated in the same deposit and wherever one or more of these occur, native gold, silver and in places bismuth and copper are characteristic accompanying minerals, in addition to which, pyrite chalcopyrite, and galena are present in many of the veins, and pyrrhotite, chalcocite, siderite, and zinc blende are found in some of them.

Sylvanite, hessite, petzite, calaverite, nagyagite, and altaite are, in all the deposits so far discovered, minerals of primary deposition, so that their presence indicates a zone of unoxidized or at least incompletely oxidized material. The native gold, so commonly found associated with the tellurides, has in many cases been derived from these minerals by oxidation, when it is generally spongy and frequently has a brownish colour; where this origin for the gold can be proved, the zone in which it and the telluride occur together lies above that of the primary sulphides and consequently (as the zone below ground-water level is reached, i.e., below the oxidized zone and the zone of secondary enrichment), the gold may be expected to cease to be free and to occur instead, combined with tellurium.

Tetradymite is known to have been discovered at but two points in Canada, viz.: at the Nickel Plate mine, Osoyoos mining division, and on the Roderick Dhu claim, Greenwood mining division, both in British Columbia. At the Roderick Dhu claim tetradymite occurs in a quartz vein like the other tellurides; but at the Nickel Plate mine it is found in contact-metamorphic rocks, and is probably also a primary constituent of the ore, although Mr. Camsell,[2] who has described the occurrence, considers that possibly this mineral may be the result of secondary surface alteration.

Uses and Value.

Tellurium as yet, has practically no technical use and consequently there is very little if any demand for the metal itself except for experimental purposes. A number of uses to which this metal may be put have recently been proposed, however, and concerning it, Edison[3] says: "I have worked it to a considerable extent and I pronounce it a marvellous substance; I could use it in large quantities if it were cheaply produced."

Potassium tellurate is employed to a limited extent, however, in therapeutics, being used for night sweat of phthisis.

Treatment and Assay.

To enter into a detailed discussion concerning the assaying and treatment of tellurium-containing ores, would be beyond the scope of this short paper; but a few lines on this topic may not be entirely amiss, since a study of the literature dealing with these ores cannot fail to impress one with the fact that tellurium has a much more general distribution and is more commonly associated with gold than has been commonly supposed.

Treatment—Ores in which tellurium occurs associated to any considerable extent with the precious metals have been a source of perplexity to many millmen and metallurgists, particularly in American practice; in many of these cases, possibly in the majority of them, the tellurium has not been detected or if it has been discovered, its presence has been ignored with disastrous consequences. In milling processes, it is found that ores in which compounds of tellurium are

* By permission of the Director, Geological Survey, Department of Mines, Canada.

prominent, are not susceptible to amalgamation or to the ordinary methods of hydraulic concentration. Concerning smelting operations Kustel[4] states that "not all tellurium combinations with gold, lose gold to a notable extent while roasting; but some do, and that up to a considerable amount, 20 per cent., perhaps even more." He also adds: "The loss is no mechanical one, occasioned by draft of the furnace, but principally by volatilization." The result of the various investigations from those of Plattner to the present, seems to be that in all ordinary oxidizing roasting of gold ores containing no tellurium that there is no loss of gold other than a mechanical one; but where ores are involved in which there is any appreciable amount of tellurium, there appears to be always a loss of gold by volatilization, in any operation involving the roasting of the ores or any of their products from which neither the gold nor the tellurium has been separated. Mr. F. C. Smith has made a careful investigation of such ores and in an excellent article[5] concerning them writes:

"Careful experiment with such ores, especially where conducted at a reduction works handling large quantities of them, should not only finally avoid embarrassment from the presence of the tellurium, but even turn it to a profit." This indicates that the only objectionable influence tellurium in ores possesses is likely to be overcome; when this is established the discovery of this metal in an ore-deposit will be cause for unalloyed gratitude on the part of the owner, as tellurium is almost invariably an indication of the occurrence of gold.

Assay—On the subject of the assaying of ores containing tellurium, Mr. Chas. A. Fulton, has published a very carefully prepared article[6] and according to him scorification of any kind is a very bad, and the crucible assay is the best, method. The fire should be moderately hot, a large excess of litharge should be used, and a button of 20 to 28 grains should be obtained, which can be cupelled directly.

Identification.

The presence of tellurium is frequently overlooked partly because, in many cases, it occurs in very small amounts, and also because its determination is a somewhat difficult and laborious process in comparison with that of gold and silver. A small fraction of an ounce of gold to the ton of ore may be easily and accurately determined by dry assay; but a similar amount of tellurium, or other metal to be found by wet methods, calls for a refined analysis. A refractory character in ores, or even the recognition in the gold carried by them of the brown spongy appearance characteristic of gold derived from the alteration of tellurides, is sufficient to arouse suspicion as to the presence of tellurium. A further significant fact concerning ores containing this metal is that even when very rich, they often fail to show colours in panning.

Localities.

Ores containing tellurides have been found in the following Canadian localities, which are named in order commencing at the northwest and proceeding towards the southeast. On the accompanying map of Canada the positions of these localities are indicated by encircled numbers which correspond with those in the list given below.

Yukon Territory.

1. Wheaton River district, Conrad mining division, on—
   - (a) The Gold Reef claim on Gold Hill.
   - (b) The Buffalo Hump group on Mt. Stevens.

British Columbia.

2. The Engineer Mines and vicinity, on the east s of Taku Arm, above Golden Gate, Atlin mining divisi
3. Valdez Island, Nanaimo mining division.
4. The Nickel Plate mine, Osoyoos mining divisi
5. Near Osoyoos Lake, Osoyoos mining division the following points:—
   - (a) Northern end of Osoyoos Lake (repor occurrence).
   - (b) On Kruger Mt., on western side of Osoy Lake.
6. Olds Mt., Arrow Lake mining division, (repor occurrence).
7. Burton camp, Arrow Lake mining division (ported occurrence).
8. Long Lake camp, Greenwood mining division, the following properties:—
   - (a) Jewel mine.
   - (b) Lakeview claims on the north side of L Lake.
   - (c) North Star claim, on the south side of L Lake.
   - (d) Enterprise claim, on the south side of L Lake.
   - (e) Roderick Dhu claim.
9. Olive Mable claim, Gainor Creek, Trout Lake m ing division.
10. Six miles north of Liddle Creek, Kaslo Riv West Kootenay district (reported occurrence).
11. Pay Roll mine, ten miles southwest of Cranbro Fort Steele mining division.

Ontario.

12. Gold Creek, Pine Portage Bay, Lake of Woods district.
13. The Huronian mine, near Jackfish Lake, M Township.
14. The Sudbury mining division, two miles so of the southeast corner of Musgrove Township (rep ed occurrence).

Quebec.[7]

15. The Opasatica district, Pontiac County.

Tellurium is reported to occur also in Newfoundla

Descriptions of Occurrences.[8]

In the following paragraphs, brief synopses are gi of the available information concerning the telluri containing ores of the above mentioned localities, gether with references to published descriptions these deposits. An attempt has been made to make list of occurrences and references as complete as sible, and it is hoped that members of the Canad Mining Institute will kindly supply any omissions t occur.

1a. Gold Reef Claim.[9]

The Gold Reef claim was staked in 1906, and was first location made on Gold Hill in the Wheaton R district, Yukon Territory, situated midway betw the Watson and Wheaton Rivers and twenty mile a westerly direction from Robinson on the White R and Yukon Railway.

The ore on the Gold Reef property occurs in a in greenstone schists in the vicinity of intrusive gr diorites, and is traceable for upwards of 1,000 throughout which distance the vein has an aver thickness of possibly four to five feet. The strik the vein, in a general way, coincides with that of formation in which it occurs, so that the greater of the quartz has been deposited along the folia planes of the rock and lies conformable to the en ing laminæ; in places, however, the deposit cuts ac

the planes of schistosity for considerable distances.

The vein-filling consists predominantly of quartz, which presents a dense, massive appearance, and with the exception of occasional particles of pyrite, contains, in most places, practically no metalliferous minerals. A few widely separated pockets of rich ore, however, have been found, ranging in weight from five or ten pounds each to one of about six hundred; this ore contains free-gold, sylvanite, hessite, petzite, and telluric ochre, the values usually representing hundreds of dollars to the ton; but so far the mineral has not been found in nearly sufficient quantity to pay for the development work undertaken on the vein.

1b. Buffalo Hump Group.[10]

The Buffalo Hump Group consists of three claims located in 1906, and situated on Mt. Stevens in the Big Bend of the Wheaton River, Conrad mining division, Yukon Territory. On the Golden Slipper claim several veins of quartz were discovered. This was at first thought to form part of a vein in situ, but which subsequent development showed to be transported; the material, however, occurs near the summit of the mountain, and appears to have been derived from the hill on which it is found.

The quartz, in addition to a small amount of disseminated galena, contains some native gold and sylvanite.

On the Surprise claim a quartz vein also occurs, which is as much as seven feet in thickness at one point, and contains promising amounts of gold and silver, but in it no tellurides have been detected.

2. Engineer Mines[11] and Vicinity.

The Engineer mines are situated on the east side of Taku Arm, ten miles above Golden Gate, Atlin mining division, British Columbia. This property was first located in 1899, and although rich gold-bearing quartz was found at various times in the early workings, the operations during the season of 1910 have resulted in the discovery of the rich ore in considerably greater amount than in previous years. The recent workings consist mainly of a few open-cuts, several hundred feet of trenching, and about fifty feet of tunnelling. A Joshua Hendry 2-stamp mill has been installed and was in operation during part of the season of 1910.

The ore occurs in veins in Upper Jurassic or Lower Cretaceous shales, slates, and related clastic rocks in the vicinity of granitic and andesitic intrusives. The veins consist mainly of quartz associated with some calcite and varying amounts of intercalated and brecciated wall-rock, and contain as ore-mineral free-gold, a brass-yellow telluride, apparently calaverite, native bismuth, and pyrite.

Two deposits of quartz and brecciated and intercalated slate and other wall-rock; these all carry gold to of 270 and 200 feet, respectively, and exposed lengths but little in excess of these figures; but on account of the thick covering of superficial materials, neither their entire widths nor their lengths could be ascertained. Traversing these two central masses, from various directions, two sets, of three and six veins respectively, have been discovered, which range in thickness from 2 to 40 feet. In addition, ten other veins from 1 to 50 feet thick were noted which have not been traced into any central mass.

The larger veins and deposits are generally to some extent brecciated and contain considerable intercalated slate and other wall-rock; these all carry gold to some extent at least, as small particles were frequently found in them. The amount per ton of the gold, however, has not been definitely determined; but is known to be low in most cases, and the few assays that have been made have generally given results ranging from traces to about ten dollars per ton.

In four or five of the smaller, more thoroughly prospected veins, pockets or shoots of very rich ore have been found. These veins are composed almost entirely of quartz with some calcite, are from 6 inches to 4 feet in thickness, and can be traced on the surface from 100 to 1,000 feet; but even these have been but slightly explored. The pockets appear to occur prevailingly at points where the veins are intersected by cross-fissures; they vary considerably in size, some containing but a few pounds while others contain several hundred pounds, and the greater part of the ore has a value of from $1 to $5 per pound. It was ascertained during the summer of 1910, that much of the quartz in the veins between the high grade pockets, will pay to mill. The only body of rich ore of sufficient size to be termed a shoot, so far explored, is in vein No. 1; this has an average thickness of from 1 to 2 feet, is at least 20 to 30 feet in length, measured along the strike of the vein, and has been followed downwards for thirty feet without any apparent depreciation in values. This shoot might perhaps be better described as a portion of the vein in which pockets are more than usually present, but practically all the material so far obtained from it has been pay-ore.

The first 800 pounds of selected ore from this property that was milled during the summer of 1910, yielded 20 pounds 3 ozs. (Troy) of gold, the next 1,000 pounds, gave 21 pounds 8 ozs. (Avoirdupois), and it is claimed that the tailings in each case contain approximately 30 per cent. to 40 per cent. of the original gold-contents; but the truth of this claim was not investigated. The ore taken from the various workings during the summer previous to September 1st, was valued at about $25,000, and from the part milled $8,000 worth of gold bullion was obtained.

Tellurides are reported to have been found on other claims near Engineer mines; but no specimens could be found by the writer when these properties were visited.

3. Valdez Island.

Mr. H. Carmichael, Provincial Assayer, Victoria, V.C., writes[12]: "From Valdez Island, B.C., we have news of a recent strike of copper ore carrying associated gold tellurides running half an ounce of gold per ton."

4. Nickel Plate Mine.

"Tetradymite is found sparingly in the upper part of the Nickel Plate mine[13]" which is situated in Hedley mining district, Osoyoos mining division, British Columbia. This mineral there "occurs in massive altered limestone which consists or garnet and epidote with much arsenopyrite, and is often found in association with free gold." Specimens of the ores from the Nickel Plate mine show crystals of tetradymite enclosing small particles of native gold."[13] This telluride "has apparently no connection with fissures," and, as mentioned above, is most probably a primary mineral here as it is in the various veins in other places, but Mr. Camsell[13] also considers the possibility of the occurrence being the result of secondary surface alteration.

5a. Osoyoos Lake.[14]

Narrow quartz veins containing tellurides of gold and silver were reported to Dr. R. A. Daly[14] to occur in the diorite found at the northwestern corner of Osoyoos Lake, Osoyoos mining division, British Columbia.

5b. Kruger Mt.

Messrs. H. A. and G. A. Guess[15] observed hessite occurring with petzite, native gold, etc., in a vein composed of quartz and coarsely crystalline siderite, and the Calumet claim, Kruger Mountain, on the western shore of Osoyoos Lake, in Osoyoos mining division, British Columbia.

6. Olds Mountain.

Tellurides have been reported to occur on Olds Mountain which formed the divide between the headwaters of Kettle River and Eight Mile Creek, which drains into Fire Valley. The deposits in this locality were examined in 1901, by the Provincial Mineralogist of British Columbia[16], who, however, was unable to find any of these minerals.

7. Burton Camp.

Mr. R. W. Brock[17] reports that some tellurides are stated to occur in Burton Camp, which is situated at the east side of the lower end of the narrows between Upper and Lower Kootenay Lakes, Arrow Lake mining division, B.C.

8a. Jewel Mine.[18]

The Jewel mine is situated in Long Lake camp, Greenwood mining division, Boundary Creek district, B.C. The ore on this property is described by Mr. R. W. Brock[18] as occurring in veins of from two to twelve feet wide, mainly at the contact between grey biotite-hornblende granodiorite and a green schist, but occasionally in one or other of these formations. In the production of these veins both replacement and fissure-filling processes have been active. The ore is galena, pyrite, and chalcopyrite, in a quartz gangue, the upper portions containing free gold and "rich tellurides" are found.

8b. Lakeview Claim.

Messrs. H. A. and G. A. Guess, identified altaite "associated with hessite, fine to coarse native gold, thin plates of native copper and, apparently, native tellurium, in segregated quartz veins carrying chalcopyrite, pyrrhotite, and chalcocite, at the Lakeview claim on the north side of Long Lake, a small sheet of water some thirteen miles north-northeast of the mouth of Boundary Creek,"[19] Greenwood mining division, Boundary Creek district, B.C.

8c. North Star Claim.

Messrs. H. A. and G. A. Guess observed hessite "associated with native gold, chalcopyrite, pyrite, and galena in a quartz vein, at the North Star claim"[20] on the south side of Long Lake, Greenwood mining district, B.C.

8d. Enterprise Claim.

Messrs. H. A. and G. A. Guess identified petzite "in association with free gold, galena, and pyrite, in a quartz vein at the Enterprise claim, on the south side of Long Lake"[21] Greenwood mining division, B.C.

8e. Roderick Dhu Claim.[22]

In 1895, Mr. Harry Guess, of Midway, identified several tellurides, including tetradymite and altaite, in a 12-inch vein cutting a large granite-boss flanked by siliceous and micaceous schists on the Roderick Dhu claim, Long Lake camp, Greenwood mining division, British Columbia. Mr. Fowler also noted tellurides on this property.

9. Olive Mabel Claim.

The Olive Mabel claim is situated on Gainor Creek, Trout Lake mining division, British Columbia, about 15 miles directly east of the head of the northeast arm of Upper Arrow Lake, and according to Prof. Kemp's[23] descriptions, a body of quartz about two feet thick, which narrows to small dimensions at each end, has been opened on this property. The vein "contains much siderite, some of which is decomposed, revealing considerable coarse free gold. Principally in the quartz, but to some extent in the siderite also, two tellurides are found. One is certainly nagyagite, as it affords a mere trace of silver, if any, but much lead and gold. The vein lies in an extensive belt of argillites," which it cuts across, and no igneous rocks appear.

10. Liddle Creek.

Mr. R. A. A. Johnston, of the Geological Survey, Department of Mines, Canada, identified as massive altaite, a mineral occurring in a gangue of white subtranslucent quartz, in a specimen said by Mr. Ruecan[24] to have been found by him at a point six miles north of Liddle Creek, Kaslo River, West Kootenay district, British Columbia.

11. Pay Roll Mine.

The Pay Roll mine is situated to the north of the Moyie River, about a third of a mile north of the point where the trail up the river crosses Nigger Creek. Here, according to Mr. McEvoy, a dike of dark-green intrusive rock, resembling a diorite, extends northward, dissecting the flat-lying massive beds of gray quartzite. A small vein cuts across this dike and "showed," in a specimen examined by Dr. Hoffman, [25] "rust-stained quartz carrying a little telluride of lead (altaite) and some particles of free gold."[26]

12. Gold Creek.

Hessite is reported to occur[27] in lead-gray, plate-like masses with quartz and a little pyrite and chalcopyrite on Gold Creek, Pine Portage Bay, Lake of the Woods region, Ontario.

13. Huronian Mine.[28]

The Huronian mine, also at one time known as the Shebandowan gold mine, is situated in location H.1, in the Township of Moss, Ont., and is about 70 miles in a direction a little north of west from Port Arthur. The rock formation here according to Bureau of Mines' reports, consists mainly of interbedded talcoid, chloritic, dioritic, and a little dolomitic schist, siliceous magnetite, and massive diorite. A small intrusive area of granite sends an arm southwestward to within a short distance of the mine and is well exposed on Jackfish Lake. The ore occurs in a vein which is six to eight feet in thickness, of which two to five feet are mainly quartz, the rest being incorporated schist. The quartz carries pyrite, chalcopyrite, galena, zinc blende, sylvanite, and a little free-gold. Mr. F. C. Smith [29] says: "The ore carried an inconsiderable amount of galena with iron and copper pyrites, argentite, hessite, sylvanite (or petzite), and probably altaite, the telluride of lead. Near the surface the ore showed considerable native gold, but this disappeared with greater depth. In some cases the tellurides occurred in irregular, bluish-grey masses enclosed in pure quartz; at other times they occurred as very dark brown scales filling small seams in the quartz. Samples of quartz from this mine, which showed no trace of metallic contents, but seemed to be saturated with the tellurides and resembled an ordinary piece of smoky quartz, have given upon assay as high as 902 ounces of silver and 34 ounces of gold per ton."

A ten-stamp mill was erected to treat the ore in 1883, and was run to some extent during 1884 and

1885, when work was suspended and has not since been resumed.

14. Sudbury Mining Division.

Mr. J. C. Nelson, of Haileybury, Ont., showed a sample of ore to Mr. R. A. A. Johnston, Mineralogist, Geological Survey, Department of Mines, Canada, which he claimed was obtained from a point in the Sudbury mining division, Ontario, two miles south of the southeast corner of Musgrove Township. Of this specimen Mr. Johnston writes: "A quartzose rock carrying small quantities of tellurium minerals containing lead, silver, and possibly gold."[30]

Porcupine Area.

Tellurides probably occur in the Porcupine area, Ontario, as some apparently unpromising veins have yielded good assay returns ascribable, it is thought, to the presence of tellurides; further, in refining gold bullion at McGill University from the Hollinger mine, lot 11, con. 2, Township of Tisdale, phenomena suggesting tellurium are believed to have been observed.

15. Opasatica District.

In the Opasatica district in the northern part of Pontiac County, Quebec, near the Ontario boundary line, on a claim owned by the Pontiac-Abitibi Mining Company, sylvanite occurs with native gold in quartz-ankerite veins cutting the Keewatin porphyrite and the Huronian breccia and associated dikes. The largest vein reported from here is about 2½ feet in thickness. The quartz is commonly banded with ankerite and carries sericite, pyrites, and chalcopyrite. The gold occurs both free and in combination with silver as sylvanite which is later than the quartz and ankerite.

From published accounts of the geology of the Porcupine country, Mr. Harvie[31] considers this district in geological characteristics must closely resemble the Apasatica and anticipates the discovery of tellurides there.

Newfoundland.

Mr. Howley[32] mentions the occurrence of tellurium in Newfoundland.

Smelting in the Interior of British Columbia.

By E. Jacobs, Victoria, B.C.

(Continued from Feb. 1, 1911.)

General Information.

Other information must be very briefly summarized. The bulk of the copper ores received is sampled in the largest mill, which includes in its equipment Nos. 8 and 4 McCully crushers, Vezin samplers, smaller crushers, rolls, etc. The proportion of the ore delivered to the quartering floor is one two-thousandth part of the quantity sampled. It is quartered by hand or in Jones riffles; part goes to the assay office, part to the owner, and part is kept as a check until the ore is paid for. The blower plant comprises 7 rotary blowers, operated by individual motors; three are Connersville type and four the later Root blowers. The largest of these delivers 33,000 cubic feet of free air per min. at a pressure of 36 ounces and requires 350 horse-power to drive it. The total power for the blower plant is 1,200 horse-power. Electric power is transmitted from Bonnington Falls, distant 33 miles, at 20,000 volts; at the smeltery it is stepped down to 550 volts. The total power consumption is about 3,000 horse-power.

Extensive brick and metal flues connect with two brick stacks, from the copper and lead furnaces, respectively. The copper furnace stack is 185 feet high and 144 square feet internal area. The flue dust, amounting to two per cent., is briquetted and resmelted. The assay office has modern equipment, including electric motor for driving the crushers, electric heater, four coal-fired muffle furnaces, and a complete equipment for wet and electrolytic work.

The ore supply comes chiefly from East Kootenay, Slocan, Nelson, Rossland, and Boundary districts, and some from the neighbouring State of Washington. Coke, of which about 225 tons is used daily, comes from Hosmer, Crow's Nest Pass, 249 miles distant. Limestone, chiefly for flux, is obtained from the company's quarry at Fife, 68 miles away; requirements are about 200 tons a day and cost is $1 a ton in the charge bins. The works are advantageously situated, with railway connections to all important mining camps in the Kootenay and Boundary districts.

Granby Consolidated Mining, Smelting and Refining Company, Limited.

The Granby Company's smeltery, situated at Grand Forks, Boundary district, is stated to be the largest copper reduction works in the British Empire, and among the largest in the world, second only to the great Washoe works at Anaconda, Montana, U.S.A.

There are at Grand Forks eight rectangular water-jacketed blast furnaces, contained in a building having steel frame and corrugated iron sides and roof, dimensions 71 feet wide by 289 feet long, with a lean-to 9 feet 6 inches wide by 12 feet high. The feed floor is 18 feet above the furnace floor. The average distance centre to centre of the furnaces, is 36 feet. There are six furnaces 44 by 266 inches, 4½-inch tuyeres, 18-inch centres, 12-inch bosh, and two furnaces 48 by 260 inches, 3½-inch tuyeres, 8-inch centres, 12-inch bosh; depth of furnaces is 15 feet 8 inches. Their total treatment capacity is 4,000 to 4,500 tons of ore per diem; they are served by two 12-inch water mains, and two 60-inch blast mains placed directly at the back of the furnaces and running the entire length of the building. The furnaces have uptakes 6 feet in diameter, with damper, which can be raised if required, but this is seldom necessary. Six-foot downtakes lead to an overhead stee flue-dust chamber 13 feet wide, 15 feet high, and 31 feet 7 inches long, erected 12 feet above the feed floo and parallel to the long way of the building. At on end it is connected with a brick flue 10 by 15 by 44 feet leading to a brick stack 13 feet diameter and 15 feet high; the other end is also connected with a brick flue and stack, the latter 11 feet square and 153 fee high. The steel chamber has a hopper bottom; a stee conveyor mechanically conveys the flue dust to a bri quette mill in which there is a No. 2 White briquettin machine with a capacity of 50 tons per diem.

The furnaces are end-feed, and the charge is delivere to them in specially designed cars, three of which mak a train 266 inches long. There are four of these trains each moved by a 30 h.p. Westinghouse electric locomo tive, and each supplying two furnaces with charge. Th cars are run into the furnace and the charge dumpe where required. The ore and coke are drawn direc from the storage bins into the cars in proper propo tions.

Two settlers are used for each furnace, and from th second the slag flows into 5-ton slag pots or cars, whic are hauled to the dump by 9 by 14-inch cylinder 14-to Davenport steam locomotives, each one of which serve two furnaces, taking out six cars a trip. At each fu nace three cars are filled with slag, while the other thre are being dumped and returned. The slag haulage sy tem equipment includes six locomotives and 52 5-to slag cars.

No. 1 blower room is 57 feet wide by 128 feet 9 inch long, built of brick and steel, with corrugated iron roo and concrete floor. In it are 8 Connersville blower one No. 10, four No. 8, and three No. 7; total air cap city, 119,500 cubic feet of air per minute. In a part the blowing engine building, are four more No. 10 blo ers, each 30,000 cubic feet capacity. The aggregate a capacity is 239,500 cubic feet per minute, which, at 3 ounces pressure, is in excess of present requirement The blowers are all belt-driven. The No. 10 machin are each operated by two 150 h.p. a.c. motors, and th others each by one 100 h.p. a.c. motor. All blowers a direct-connected to pipes which lead to one or oth of the 60-inch mains.

The converter building is of steel, covered with co rugated iron on roof and sides; its dimensions are 4 feet wide by 240 feet long, with two lean-tos 23 a 32 feet wide, respectively. A 40-ton 4-motor Morg Engineering Company crane, 42-foot span, runs the fu length of the building. Matte is brought from the fu naces by a 10-ton three d.c. motor Morgan crane, wi 24-foot span, which runs from end to end of the fu nace building. A second 10-ton crane is kept in reser There are three 84 by 126-inch electrically operated co verter stands with 10 shells, and one stand operated h hydraulic power, with three 72 by 100-inch shells. Matt from 35 to 40 per cent., is converted to 98.5 per cer blister copper, which is poured direct into moulds pas ed under the mouths of the converters. The blast pre sure used is 12-pound. Converters are connected wi 10 by 10 by 340-foot flue chambers, and thence to 15 foot brick stack, for settling of flue dust. A slag-castin machine, Anaconda type, conveys all converter slag steel bins, whence it is taken in railway cars to fu nace feed bins for re-smelting. Quartz, coke and cl are taken to relining floor in cars and motor. On th floor there are three Allis-Chalmers self-discharge mo tar mills, and two 7-foot and one 6-foot 6-inch pa A 75 h.p. motor drives all machinery. Air rammers a used for tamping the lining of shells.

The blowing engine building is of similar materials to these of the blower room; its dimensions are, width, 55 feet 4 inches; length, 212 feet 9 inches, with an L 41 feet 2 inches wide by 73 feet long. There are three engines: One 36 by 38-inch Nordberg, capacity 3,700 cubic feet of air per minute; one 34 by 34 by 36-inch Allis-Chalmers duplex, capacity, 6,000 cubic feet per minute; and one 40 by 40 by 42-inch Nordberg duplex, capacity 10,000 cubic feet per minute; total air capacity, 19,700 cubic feet per minute, which is ample to operate all four converter stands simultaneously. All engines are belt-driven, by 200, 300, and 500 h.p. motors, respectively. One motor generator set, of 200 h.p. a.c. motor direct-connected to two 85 k.w. generators, 220 volts, operates the cranes, tilts the converters, and runs the charge system. A hydraulic triplex plunger pump, 5 by 10-inch, 250 pounds pressure, operates the small converter stand, slag-casting machine, etc. A 12 by 18-inch Rand compressor drives the tamping machines.

The electric power used at the smeltery ranges from 2,000 to 2,200 h.p. Motors have been installed having an approximate aggregate capacity of 3,500 h.p., which is considerably in excess of the horse-power at present used. About 400 h.p. is generated by the company's own hydro-electric plant; the West Kootenay Power & Light Company supplies the rest of the power used, bringing it in from its generating station at Bonnington Falls, 65 miles distant, at 40,000 volts. This is stepped down to a working voltage of 440 volts at the smeltery. Connection has also been made with a power station at Cascade, 16 miles distant, so that there are three sources of power when needed. The pumps are also in the company's power house, 100 feet below and 1,000 feet away from the smeltery. Six Smith-Vaile 8 by 10-inch triplex plunger pumps have a total capacity of 4,740,000 gallons every 24 hours.

Mention of the storage bins and sampling mills was omitted earlier. There is bin storage capacity for 12,000 tons of ore and 7,000 tons of coke; also ground storage for 12,000 tons of coke. There are two Snyder automatic sampling mills, one with a bunker capacity of 400 tons and the other of 450 tons. Attached storage bins give additional capacity of 4,350 tons. Total ore storage capacity at the works is, therefore, 17,300 tons. Assay office and laboratory are well-equipped and officered. Mechanical department is large, providing for all repairs and renewals other than castings, which are obtained from a local foundry.

The Granby Company employs about 250 men at its smelting works, and something like 400 at its mines. Ore, etc., smelted during ten years to June 30th, 1910, totalled 6,491,149 tons, of which 6,263,091 tons was from the company's mines at Phoenix. During the latter half of 1910 approximately half a million tons of Granby ore was smelted, beside some foreign ore. The aggregate to the end of 1910 is, therefore, about 7,000,000 tons.

Metallurgical Conditions.

Conditions at the Granby Company's smeltery are different to those obtaining at other copper smelteries, outside the Boundary district of British Columbia, in that the Granby Company has to treat an ore giving a very low percentage of sulphur on the charge—as low as two per cent. On the other hand the ore contains silica, iron, and lime in such favourable proportions that no barren flux, neither iron nor lime is required. If it were necessary to use an iron flux in smelting Boundary district copper ores, it would not be practicable to mine and treat them at a profit, unless the price of copper was much higher than it usually is, for the iron ore obtainable in the district in considerable quantity does not contain any marketable value. The slag from the Granby furnaces runs from 45 to 48 per cent. silica all the time, while occasionally it has contained as high as 52 per cent., which has been the maximum reached. The ore is smelted as it comes from the mine; usually it ranges from 40 to 48 per cent. silica. Smelteries in other parts generally have ores running higher than they require; on the other hand they have the advantage of a low silica content in the ore. It will be seen, therefore, that, as already stated, conditions under which the Granby Company's furnaces are ordinarily operated are quite different to those attending the reduction of copper ores elsewhere than in the Boundary district.

The low average value of Granby ores makes it imperative that labour costs shall be kept down as much as possible, consequently wherever it is practicable to use them, mechanical devices are substituted for the labour of men. This is especially the case in feeding the furnaces, there being no mixing of the charge or other handling of materials between the ore and coke bins and the furnaces. Cars, pushed by electric locomotives, receive the ore and coke direct from the storage bins and dump them into the furnaces, the mechanical arrangements being such as to admit of this being done quickly and effectively. The company's engineers have devised many appliances for labour-saving, so that economy in working methods is general throughout both mines and smeltery.

It is probable that in the early future changes will be made in the smelting practice that will admit of a further saving being made in cost of treating the Granby ores. The company has lately secured under option of purchase mines that it is believed will yield largely heavy sulphide ores. Heretofore it has been, and still is, the practice at the company's smeltery to produce a 35 to 40 per cent. copper matte at first smelting, which involves a loss in the slag of about 5 pounds of copper to the ton of ore. With the sulphide ores, above referred to, as an aid to the proposed change, it is believed that a saving will be effected, and as a consequence more profit be made out of the ores from the company's big mines at Phoenix, B.C. The ore will be smelted to a 10 per cent. matte, which will be regraded to a 45 per cent. matte for converting. It is thought that not only will the cost of converting to blister copper be less than at present, but by utilizing as fuel the heavy excess of iron and sulphur in the sulphide ores, the percentage of coke required in the charge will be reduced. It is expected, too, that the copper loss in the slag will be less by 1½ to 2 pounds per ton of ore, which, of itself, would mean an appreciably large addition to the profit to be made out of ores from the company's mines at Phoenix. Mr. Wakely A. Williams, superintendent of the smeltery, has been with the Granby Company ten years, during which time he has effected many economies in the treatment of ores.

British Columbia Copper Company, Limited.

During 1910 the British Columbia Copper Company increased the total blast furnace capacity of its smeltery at Greenwood, Boundary district, by one-third, thereby bringing its maximum treatment capacity up to about 2,600 tons per diem. This was done by increasing the hearth area of two of the three furnaces by 50 per cent. Previously all three furnaces were 48 by 240 inches at the tuyeres, and their approximate average ordinary total capacity had been about 1,800 tons daily, with a maximum of nearly 2,000 tons. Now they will average between 2,400 and 2,500 tons per diem.

The increase in smelting capacity has necessitated a corresponding increase in the plant for feeding the furnaces and taking away the molten slag; also an extension of the crane run at one end of the converter building. For slag hauling a larger locomotive, capable of handling two 25-ton slag cars at a time instead of one as in the past, has been put in. Heretofore, there have been in use two 15-ton Baldwin-Westinghouse electric locomotives for slag-handling, and three 7½-ton locomotives for furnace charging. Another charging locomotive has been added, to meet the increased capacity. The slag cars are 25-ton ladle-cars, side dumping, and each equipped with an electric motor having worm gear for tilting the car to dump its contents. The British Columbia Copper Company was the pioneer in using this style of car for slag dumping; the design has since been adopted by the Canadian Copper Company, at Copper Cliff, Ontario, and probably a dozen other smelting works, the latest being the International and the Mason Valley Company, Nevada.

The converter building is of steel, dimensions 45 by 90 feet. It has two converter stands with 84 by 126-inch horizontal shells, these taking matte of 45 to 55 per cent. copper tenor and producing blister copper 99.3 per cent. pure and carrying 20 to 50 ounces silver and 5 to 15 ounces gold per ton. The product is sent to the works of the United States Metals Refining Company, Chrome, New Jersey, for refining. The stands are tilted by hydraulic accumulators, and the shells are handled by a 40-ton 4-motor travelling crane. More converter shells have recently been added, making a total of seven. This Bessemerizing capacity is ample, notwithstanding the recent increase in the furnace capacity above-mentioned.

Electric power, transmitted from Bonnington Falls, distant more than 80 miles from the smeltery, is used in the works, in which there are installed motors having a total capacity of about 2,000 h.p. Among the motors are three of 300 h.p., each belted to one of three large Connersville blowers, which supply the blast to the furnaces.

Ore bins have a total capacity of 12,000 tons, and there is also bin accommodation for much coke, the consumption of which, with three blast furnaces running, is 8,000 to 9,000 tons monthly. A reserve of 10,000 to 12,000 tons is kept as an emergency supply should there be interruption in the regular receipt of coke from the colliery. The coke is obtained from the International Coal and Coke Company's colliery at Coleman, Alberta, distant 370 miles by Canadian Pacific Railway Company's railway line.

The company obtains the greater part of its ore supply from its own mines (including the Rawhide mine of the New Dominion Copper Company, in the stock of which it holds a controlling interest), and it endeavours to maintain an average monthly output as follows: From the Mother Lode mine, 36,000 tons; Rawhide, 20,000 tons; Wellington group, 3,500 tons; Napoleon (at Boyds, Wash.), 2,500 tons. Mother Lode and Rawhide ores are typical Boundary district copper ores, low in marketable metals; Wellington group ore is chiefly oxidized and having little value other than gold; of the Napoleon ore the sulphide goes to the smeltery, where it serves as a pyrrhotite flux to reduce the tenor of the copper matte; the oxidized ore is to be treated in a mill now being erected near the mine. There is about 100,000 tons of oxidized ore overlying the sulphide; this is to be mined by the caving system, and conveyed by an aerial tramway to receiving bins at the mill. It will be weighed at the receiving terminal and automatically sampled at the mill receiving bins. The mill is being equipped with ten stamps, amalgamating plates, and cyanide appliances, the last to be used only if the percentage of recovery on the plates is insufficient. Capacity of mill will be 100 to 125 tons per diem.

Provision is being made for increasing the ore supply from the company's mines, and thus render its smeltery independent of custom ores, if these be not obtainable in sufficient quantity. The Rawhide output is to be increased to 30,000 tons a month, while 3,000 tons will be obtained monthly from the Lone Star. The latter is a mine situated just across the International Boundary line. It has an available reserve of 300,000 tons of gold-copper ore, of a higher average copper tenor than that from the company's other mines, beside being a good matte maker. An aerial tramway, 29,000 feet between terminals, is about completed, from the Lone Star mine to the Canadian Pacific Railway near Boundary Falls, three miles distant from the company's smeltery; its capacity will be about 20 tons an hour.

Coke is obtained from Southwest Alberta, the railway distance between the colliery and smeltery being 370 miles. With three blast furnaces running, the consumption of coke is 8,000 to 9,000 tons a month. A reserve of 10,000 to 12,000 tons is kept as an emergency supply in case of interruption in the regular receipt of coke from the colliery.

The two companies are under the management of Mr. J. E. McAllister. Together they employ 500 to 540 men, of which number 118 is the normal force at the smeltery at Greenwood. The amount of the payroll of the two concerns (including that of the Napoleon) totals between $62,000 and $65,000 monthly. The approximate figures of production during 1910 are as follows: Material smelted, 456,000 tons. Contents: Gold 25,640 ounces; silver, 85,900 ounces; copper, 7,351,000 pounds. Included in the ore receipts were the following: From Mother Lode mine, 352,000 tons; Oro Denoro mine, 11,473 tons; Wellington group mine, 19,200 tons; and Rawhide mine, 54,400 tons.

Obituary

Aaron H. Kelly, of Nelson, B.C., died at Victoria on the night of February 15. He left Nelson in January, intending to pay a visit to California, but proceeded first to Victoria, where he had an operation performed for some internal complaint. He rallied after the operation, but eventually heart trouble caused a relapse, and death ensued. Mr. Kelly was 64 years of age. He was born at Fredericton Junction, New Brunswick, where he was educated, and after leaving school engaged in business there. In 1878 he went thence to Denver, Colo., where he obtained an appointment with the Rio Grande Railway, then being constructed. Later he proceeded to San Francisco, and after a time spent there as a mining broker, was some years prospecting in Arizona. Going north to Spokane, Wash., he was first associated with others in working mining property near Northport. In 1888 he went to Nelson, B.C., the discovery of the Silver King mine having attracted many men to that vicinity. Ever since then he has been interested in mining, and owned a number of mineral claims. Among others in which he was largely interested was the Dandy group, adjoining the Silver King, both of which properties were lately sold to a syndicate of British Columbians now preparing to operate these mines. The May and Jennie group, also near Nelson, is another property in the development of which Mr. Kelly spent much money. Eventually he

organized the Reliance Gold Mining and Milling Company, of which he was managing director. This company equipped the May and Jennie with a milling and cyanide plant. In connection with the latter, a 12-foot Hendryx agitator (the first installed in British Columbia), was put in, under the supervision of W. J. Elmendorf, consulting engineer, of Spokane, Wash. Afterwards much experimental work was done here by Douglas Lay, now in charge of the Van Roi silver-lead mine and concentrating mill, near Silverton, Slocan. Latterly Mr. Kelly became interested as well in oil and coal lands. His body has been sent to Fredericton Junction for interment there.

INDUSTRIAL NOTES.

In view of the growing importance of colliery and mine ventilation, Catalogue No. 26A., recently issued by the Jeffrey Manufacturing Company, is most timely. It is entitled "Jeffrey Mine Fans." Some distinctive features of these fans call for notice. The steel casing is complete, extending to the ground line, thus doing away with the usual masonry requirements. Each fan wheel is assembled in the shop and balanced on ball-bearing rollers. All parts of the fan casing are fitted up before shipment, thus simplifying erection.

The catalogue shows illustrations of many Jeffrey installations. Useful ventilating formulæ are scattered throughout.

PERSONAL AND GENERAL

Mr. C. A. Moreing is in Porcupine.

Mr. J. L. Parker has removed from Victoria to Vancouver, B.C.

Mr. R. H. Flaherty, representing the mining interests of Mackenzie & Mann, has opened an office at Port Arthur.

Mr. Samuel W. Cohen, general manager the Crown Reserve Mining Company, has recently returned from a six weeks' trip to Europe in the interests of his company.

Mr. Percy Williams, consulting mining engineer for the Canadian-American Exploration Company, Limited, is visiting Toronto and New York. He will again visit Toronto in May. Mr. Williams' headquarters are in Vancouver, B.C.

Mr. W. H. Trewartha-James, of Victoria, B.C., general manager of the Tyee Copper Company, is expected to return to British Columbia during April from a business visit to New York and England. During his absence Mr. E. J. Hearn has been acting manager for the company at Victoria.

Arrangements have been made to keep the office of the Canadian Mining Institute, Rooms 3 and 4, Windsor Hotel, Montreal, open from 9 a.m. until 10 p.m., for the convenience of visiting members. A record of evening attendance will be kept to determine whether the additional expense will be justified

Mr. M. S. Davys, for years resident at Nelson, B.C., who prior to his removal to England was one of the most active mine operators in the West Kootenay district, is expected to shortly return to British Columbia, on one of his periodical visits, in connection with several mining enterprises in which he is still largely interested.

Mr. Chas. Biesel, superintendent of the Consolidated Mining & Smelting Company's mines in the Boundary district of British Columbia, has gone to Michigan, U.S.A., to examine mining property for United States people. It is reported in the Boundary that Mr. Biesel may soon enter the employ of the company with which his former chief, Mr. W. H. Aldridge, is now associated.

Mr. O. B. Smith, Jun., of Phoenix, B.C., superintendent of the Granby M. S. & P. Company's mines, recently paid another visit to Goose Bay, Observatory Inlet, to ascertain what further progress had been made with the exploration of the Hidden Creek Copper Company's mine there, which mine is being prospected by the Granby Company under its option of purchase.

Prof. Wm. Galloway, F.G.S., of Cardiff, Wales, arrived in British Columbia about the middle of March, with the object of investigating the reported occurrence of coal on Tumbo Island, which lies in the strait between Vancouver City and Vancouver Island. He was accompanied to the property by his son, Mr. C. F. J. Galloway, B.Sc., and Messrs. Wm. Blakemore and A. E. Hepburn.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

THE ALBION MINES FIRE.

In the Nova Scotia Mines Report for 1910, Mr. Thomas Blackwood, Deputy Inspector of Mines for Pictou County, gives a full meed of credit to the usefulness of the Draeger apparatus and the trained men from the Dominion Coal Company and the Nova Scotia Steel Company in combatting the fire in the Cage Pit in January of last year. Mr. Blackwood gives a detailed account of the circumstances attending the fire, and expresses the opinion that it was purely a gob-fire caused by spontaneous combustion arising from the presence of iron pyrites together with slack coal in the old goaf. His conclusions are best given in full: "I have grave doubts if the fire would have been put out if it had not been for the timely arrival of the Dominion Coal Company's and the Nova Scotia Steel Company's men, with the Draeger apparatus and fire fighting material. The men lost no time after their long journey in getting into their helmets and going to work. It was soon evident after a few hours of constant and strenuous work that they would be successful in getting control, which they did after 24 hours, and that it was only a matter of time until the seat of the fire would be reached. As this is the first fire that I have had the privilege of seeing fought with the Draeger apparatus, I must say that I am highly impressed with it; in fact, I cannot do justice to its merits. I have already stated that I have grave doubts if the fire would have ever been under control without the Draeger apparatus. After what I have seen I think that every coal company should have them, or some others of a similar kind. I do not think that any colliery is complete without an outfit of this kind, as no one can tell at what time they may be required.

"I see by the press that the Mines Department of British Columbia makes it compulsory upon the coal companies in that province to be equipped with them. Legislation to the same end has been passed in England. I hope it will not be necessary for our Government to have to make it compulsory in Nova Scotia,

as the companies will see the wisdom of following in the footsteps of the Dominion Coal Company and the Nova Scotia Steel Company in having them installed in every colliery in Nova Scotia without being compelled to do so by legislation.''

It is said that the Provincial Workmen's Association is sending a deputation to Halifax to request the Nova Scotian Government to take steps to ensure the provision of the Rescue Station for the collieries on the mainland of Nova Scotia. Such a provision might very easily mean the saving of valuable property, and maybe even life. The usefulness of oxygen helmet apparatus for fighting underground fires is not now a matter for question. It is an established and approved fact, and there is not now a single mining country in Europe which does not compel such provision and the training of men in the use of the apparatus. The United States have recently erected a large number of stations, and with the initiative of that nation when once they commence a thing, they have fitted up a so-called rescue train, which seems to be about the last word in mine-rescue work. British Columbia and Alberta have both enacted legislation, or are in the act of doing so, and it should not be for Nova Scotia to lag behind the rest of the world, particularly when this Province can boast of having the first properly equipped station on the American continent.

In the report of the Chief Inspector of Mines in England—Mr. R. A. S. Redmayne—on the Whitehaven explosion, it is stated that the fire might have been effectually combatted in the earlier stages, ''especially had the rescuers been possessed of smoke helmets and fire extinguishers.'' In Mr. Redmayne's conclusions he states as follows: ''The almost total failure of the rescue operations constitutes a convincing argument in favour of the provision at every colliery of trained rescue brigades, and means of summoning them at short notice. The summoning could easily be effected by some form of agreed-upon signal, such as blowing the colliery steam whistle a certain number of times or continuously until sufficient help arrived.''

It seems an extraordinary omission that at many collieries where an efficient surface fire brigade is kept, provided with suitable apparatus, it should not be thought necessary to have the same provision for the underground workings, where a fire is always a far more serious matter and has always large quantities of inflammable material to feed it. On the surface it is possible to take out insurance, and the fire insurance companies insist on some measure of protection. Underground it is not possible to effect insurance, because the companies recognize the infinitely greater risk of fire and the great difficulties of combatting it. Coal companies have to be their own insurers underground. This reason alone would seem sufficient to move colliery owners to take reasonable precautions against fire, particularly when it is further considered that the whole revenue of a colliery company is derived from its underground workings.

Dominion Coal Output.

The output of the Coal Company's mines for February was 262,828 tons, comparing as follows with previous years:

1908	285,649
1909	209,656
1910	204,521

The individual mines produced as under:

No. 1	43,583
No. 2	52,762
No. 3	14,225
No. 4	28,215
No. 5	20,985
No. 6	14,753
No. 7	13,232
No. 8	11,767
No. 9	27,852
No. 10	11,327
No. 12	16,344
No. 14	6,349
No. 15	1,315
No. 16	119
	262,828 tons.

It will be noticed that there are now four mines producing coal in the Lingan district. No. 16 is the latest addition, and makes its first appearance in the output figures during February. The coal from this new field is of excellent quality, and is in great demand. During the coming shipping season between 45,000 and 50,000 tons per month will be supplied by the new mines.

At No. 2 Colliery the new screening plant and picking belts have been completed. The new exhaust-steam turbine generating plant has so far proved an unqualified success. One can go into the large power house at that colliery any time and see three 600 k.w. generating units stand idle, while the turbine is carrying the whole load of the electric power requirements, and making at the same time so little noise that a close inspection of the machinery is necessary in order to be able to tell whether or not the turbine is working. Formerly the exhaust steam that is doing this work went to waste. It is a marked lesson in possible economies of power.

The drift ice off the Cape Breton coast has been very heavy this year, and the persistently low range of temperature throughout the month of February, combined with an almost total lack of wind-storms, has helped to cement the ice-floes into unusual solidity and thickness. The shipping operations of the Dominion Coal Company have not, however, been seriously interfered with as they have been able to use the ice-free port of Louisburg. The long continued series of mild winters which have visited Cape Breton have tended to minimize the importance of Louisburg as a winter shipping port, but that it has undoubted natural advantages in this direction the weather conditions of the present winter have abundantly proved.

The jealousy which exists among the seaport towns of the Maritime Provinces is distinctly entertaining. The Halifax ''Herald'' and the St. John ''Telegraph'' both recently gave prominence to a report that Sydney harbour was blocked by an ice-barrier, which would need to be dynamited before navigation could be made possible, and that it would take a whole summer's sun to melt the obstruction. A sea-captain is reported to have told the ''Herald'' that in some places off the Cape Breton coast the ice was sixty feet in thickness! It is not for the best interests of the Maritime Provinces that such canards should be given prominence in reputable newspapers, and be passed along to the outside world as items of accurate news. We are very much annoyed when English and foreign papers speak of the severity of Canadian winters, but if such unpardonable exaggerations appear in Nova Scotian newspapers, what proportions will the story reach by the time it has been copied into the papers of the outside press? The real truth is that the first rainstorm will clean out Sydney Harbour in one night.

Safety Lamps.

There have been two gas explosions in Nova Scotia recently both directly traceable to the use of a naked light by a mine examiner in the discharge of his duties. One case occurred at the Chignecto mine in June, 1910, and in this instance both the examiner and the boy who attended him were killed. The other case was at Sydney Mines in the early part of this year. In this instance the examiner had opened his safety lamp and struck a match, an act that caused not only his own death, but that of seven other men. In view of these incidents it is a matter for congratulation that the Commissioner of Mines for Nova Scotia is introducing two amendments to the Coal Mines Regulation Act dealing with this danger. In bringing the amendments before the House the Commissioner said:

''This bill was designed to bring about the prohibition of the use of any other than locked safety lamps in the coal mines of the province. It contained the following provisions:

''1. From and after the coming into force of this Act no light or lamps other than locked safety lamps shall be brought into or used in any mine.

"2. Provided, however, that it shall be lawful for the inspector of mines to authorize the use of electric lights in any part of any mine in which such electric lighting can be used with safety.

"3. This Act shall not come into effect until proclaimed by the Governor-in-council by proclamation published in the "Royal Gazette," fixing a date not less than three months from the first publication of such proclamation, from and after which the Act shall be in full force and effect."

In moving the second reading of the second bill the Commissioner explained that the intention of the bill was to amend rule 7a of section 46, chapter 8, of the Acts of 1908. The rule provided that every mine examiner shall at all times, while in the discharge of his duties, use a locked safety lamp, and shall, unless the deputy inspector permits otherwise, be accompanied by an employee of the owner, not less than 18 years of age, who shall also use a locked safety lamp. There was reason to suspect that the rule as read had been evaded, and that officials had carried into the mine with them a locked safety lamp and also a lamp not locked, and that this had caused an explosion with fatal results. The purpose of the bill was to amend the rule so as to provide in each case that the party referred to should carry with him a locked safety lamp "and no other lamp or light."

There should not be, and there probably will not be, any objection raised by either the mine owners or the workmen of Nova Scotia against the two proposed amendments. It is the well-known experience of many mine managers that the very workmen who have complained of the introduction of safety lamps would to-day be the last to wish to return to the use of naked lights.

QUEBEC.

The mining community is still absorbed in the radical changes which have recently taken place in connection with the personnel of the Amalgamated Asbestos Corporation and its method of operation. Mr. R. H. Martin, who for the past 25 years has been closely associated with the asbestos industry and for the past several years has been regarded as the principal sales agent for raw asbestos in the United States and on the Continent of Europe, has resigned from active connection with the company. Mr. B. J. Bennett, who has for many years been manager of the Kings Asbestos Mines, Thetford Mines, the largest producer in the camp, and who for the past year has been general manager of the Amalgamated, has also severed all connection with the company. Mr. Martin, Jr., who for the past year was assistant general manager of the corporation, has also resigned.

Mr. W. J. Sharpe, M.E., recently of Pittsburg, Pa., has been appointed general superintendent of the Amalgamated Asbestos Corporation, with residence at Black Lake, from which point he will personally conduct the operations of the company. Mr. Sharpe is enacting strict rules of economy, notably the concentration of the several office forces to one principal office, at the King Asbestos Mines, Thetford Mines, with only the really essential clerical work performed at each of the several mines. Aside from strict economic method of working there will be no decided change in method of operation, rather following the plan of gradual improvement while the plants are in operation.

Work in Thetford Mines, Black Lake, and East Broughton has been very quiet since the first of the year, and indications point to active operation being resumed about 1st April. The effect of the slowing down for the winter months has been to reduce the surplus asbestos stocks very considerably. The long and short grades of fibres are pretty well cleared, with only the paper stock in excess. A plan has been suggested by some of the mining companies whereby the amount of paper stock can be reduced by grading it into the longer and shorter grades, and thus obviating the difficulty of having one grade in excess while the other grades are not sufficient to meet the demand.

Mr. C. H. Parker, for several years millwright for the Johnson Company, has accepted a position with the North Western Asbestos Company, at Casper, Wyoming, and leaves for his new position on the first of April.

Mr. J. M. Forbes, recently with the Wagner Electric Company, Montreal, has been appointed local manager for the Black Lake Consolidated.

"Harry" Williams, one of the old landmarks of the asbestos industry and for several years general superintendent of the Asbestos & Asbestic Company, at Danville, Quebec, has resigned his position and will represent mining interests in Porcupine.

Several of the mining companies had representatives in the U. S. A., and on the Continent during the past winter negotiating for the sale of asbestos. Among these were Messrs. R. H. Martin, B. J. Bennett, A. H. Martin, Walter Raleigh Kerr, W. J. Woolsey, Edward Slade, A. S. Johnson, W. R. Leventritt, George Rumple, and Col. J. J. Penhale.

One of the most important and significant mining deals yet concluded in the district took place in Arthabasca on the 13th instant, when the Ward-Ross property, west half lot 27, range V., Thetford, was sold by public auction for $710,000 to Mr. Frank Ross, of Quebec City. It is understood that the Martin-Bennett interests will control the enterprise, and operations have already begun preparatory to opening up the property. This property adjoins one at present owned by the King Brothers, Limited, and the two will be worked together. Both properties are known to be valuable, and, their location being right in the centre of the Bell & Johnson properties, give every indication of being a large producing concern.

It is interesting to note that the Ward-Ross property was the first shipper of asbestos in the district. The Ward brothers shipped their first carload in May, 1879, the second shipment being made by the Johnson Company in September of the same year. Some years afterwards the Ward Brothers became involved in litigation with the Q. C. R., with the result that the property passed out of their hands into the hands of the Johnson Company to the extent of three-quarters undivided interest. Mr. A. S. Johnson, of the Johnson Company, was the principal opposing bidder at the sale.

The Dominion Gold Fields of Canada, Beauceville, Que., has been purchasing large quantities of machinery for the new hydraulic plant which is to be erected in the placer holdings of the company, during the coming summer.

The East Canada Smelting Company, at Weedon, Que., is still operating vigorously and reporting a valuable and increasing production. The copper ore is shipped largely to the Nichols Chemical Company, at Capelton, Que., for the saving of the sulphur values for their chemical works, the resulting matte being shipped to the United States for refining.

A great deal of disappointment has been expressed over the Preliminary Report on the Chibongamon Region. It is felt that if the report had emphasized the fact clearly that the conclusions arrived at were merely to enable the Provincial Government to decide whether it were advisable for them to build a railway into the district at once or not, and not to be taken as any criterion of the wealth of the vast hinterland, it would not then be taken as a deterrent force to the prospector who might be inclined to go into this district. The Report agrees that the rock formation is all that could be desired, in fact, equally favourable in every way to the formation which extends across northern Ontario to Labrador coast. The practical mining man knows that had the party which made the report spent their time on a plot of fifty square miles their conclusions could only be taken as an outline of the geological formation and in no way final as to mining possibilities of the area; in fact, we have noted that the report made by the geological agents covering the Cobalt region, but a few years prior to the discovery of vast riches there, in no way revealed the economic wealth of that camp. Dr. Miller has wisely intimated that the geological party should confine their efforts to mapping given areas and leave the work of finding minerals to the prospector. Among mining men it is felt that a vast stretch of country containing such excellent showings and rock formations must hold an immense store of minerals, and it only remains for the government or private capital to encourage the prospector in order to have these riches speedily revealed.

ONTARIO.

Cobalt, and Other Silver Areas.

The principal factor in the Cobalt situation is still the lack of power. The McKinley-Darragh, Cobalt Lake, Nipissing, Kerr Lake, Coniagas, Buffalo, Crown Reserve, Townsite, Temiskaming, Trethewey, City of Cobalt, Hudson Bay, and O'Brien are now all using their own compressors. Many of these properties, however, have outgrown their compressor capacity since the customs air was introduced into the camp. These have now to curtail their operations and production. The consequence of the failure of power falls heavier on the prospects that have no plants of their own. These have had to shut down entirely. Probably a thousand men have lost employment since the first of the year through these causes, and the mining companies are worse off than if they had been running with their own power all the time.

Not until the thaw releases the waters of the Northern Ontario rivers will there be any relief. The British Canadian has absolutely no air at all and the Cobalt Hydraulic is in little better position. The cause is the same in both cases, the power plants were too big for the head of water obtainable.

The break-up is expected about April 10, but until then it is useless to expect any relief. The electric power from the plants is not affected and the mills have been able to run at full capacity.

During the month of February the Nipissing mined ore estimated at a net value of $185,332, and shipped ore of net value of $90,400. Air conditions alone are responsible for the drop. Development particularly was retarded very much indeed.

The principal development at the Nipissing was at shaft 122, where, after drifting 350 feet to the east on a stringer of the main vein at the 165-foot level, a shoot of rich ore was encountered.

Mr. Hugh Park, of the Nipissing, and Mr. P. A. Robbins, of the McKinley-Darragh, have examined the Keeley mine at South Lorrain for the liquidator of the Farmers Bank, and have made their report on the matter.

There is very little chance that La Rose will increase the dividend rate at the quarterly meeting. Both the Princess and the Dawson have practically had to restrict their operations to stoping out what there was in sight owing to the failure of customs air.

The Barnett properties at Elk Lake have recently yielded a very promising surface showing. There is an ore body 60 feet long by twenty inches wide of calcite and aplite, in which the leaf silver can be easily discerned. Several good surface finds have been made in the vicinity but owing to lack of interest and transportation conditions little work has been done.

The new 20-stamp mill is now running at the Hudson Bay mine, Cobalt. It is on the straight concentration plan first introduced into the camp by Mr. Bourne, at the Northern Customs plant. Underground, two new high grade stringers have been cut at the 100-foot level. There now appears a disposition to put some of the stock of the $3,500,000 company on the market.

On the Alice Lorrain Silver Mines, in South Lorrain, at the bottom of a 26-foot shaft, some niccolite and a little native silver have been discovered in a wide and strong vein. The Alice Lorrain took over the holdings of the Elkhart Mining Company.

The Nipissing made the largest bullion shipment from one mine last month, when they sent out 105 bars weighing 106,430 ounces, valued at $49,675.

In all probability the Northern Customs Concentrator Company will build a 60-stamp mill at some place in the centre of the Kerr Lake camp. They are already assured of enough ore to feed twenty stamps for some years. The Lawson is willing to make a contract for another 20 stamps, and the Kerr Lake has now come into line also. Low grade ore will also be sent for treatment from the Hargrave, the Bailey, and other mines in the section.

On his European trip, Mr. S. R. Cohen, general manager of the Crown Reserve, who has just arrived back in Cobalt, made a contract with the Kingdom of Saxony for the delivery of ore containing nearly three-quarters of a million ounces of silver for the smelters and refineries in that country and ultimately the currency.

Mr. A. A. Cole, for the T. & N. O., and Mr. Mickel, for the Ontario Government, have inspected the Gowganda and Elk Lake properties with a view to seeing if their prospects justify the building of a railroad into the country.

The King Edward mine, on Cross Lake, has been abandoned. The company as a last resort put down a shaft to the 500-foot level and did some drifting. Not finding any more ore they shut down before reaching the contact, which is believed to lie another hundred feet down. Last year the report shows a deficit of $23,152.

The mine captain and the shift boss of the Temiskaming mine were severely censured by the jury inquiring into the death of Albert Sullivan, killed by a blast in a winze. The Government will institute a suit against the company.

The Millerett mine, of Gowganda, has found high grade and milling ore in the diabase area at the 150-foot level. Drifting both ways from the shaft a narrow high grade streak has been cut in the middle of several feet of milling rock. The vein was of smaltite carrying low silver values at the 70-foot level.

It has been decided to erect a 20-stamp mill on a plot of ground leased from the Nipissing Company at the south end of Cobalt Lake for Cobalt Lake ore. Since the opening of the year fifteen or sixteen cars have been shipped and these have realized $30,000 gross.

The death of Mr. M. T. Culbert, manager of the O'Brien mine, was as unexpected as it was deplorable. He went to Toronto with the confident expectation of pulling through the operation for appendicitis with success. He has been in the camp for six years, ever since mining commenced on the O'Brien, and during all that time he has been a conspicuous figure. Around him on the O'Brien had grown up a small village with miles of underground workings and a big mill, all created under his superintendency. Mr. Culbert was considered the foremost geologist of the camp. He was this year elected the president of the Temiskaming Mine Managers' Association, and has always been prominent in Institute work.

Arrangements have been made for the installation of ten more stamps at the Temiskaming, raising the capacity of the concentrator by a third. The company decided to pay the regular 3% per cent., without the bonus, at the quarterly meeting. The lack of power, the expense of developments at the Peterson property at North Cobalt, and on the Pearl Lake claims at Porcupine reduced the income.

According to the annual report of the Wettlaufer Lorrain Silver Mines, the production last year amounted to 265 tons, containing 230,000 ounces. The development on the third and fourth levels had doubled the ore reserves, till now they stood at between 3,500,000 and 4,000,000 ounces. The company declared its intention of shipping a car of high grade every month.

Porcupine, and Other Gold Areas.

There is now no fear of an early thaw and the break-up is not looked for until about April 10. Last year the roads became impassable by the middle of March and completely disorganized the plans of late shippers. With the added time operators ought to be able to get in all their supplies before the break-up. The steel is now laid to Frederickhouse and it is expected that freight can be carried the first eight miles by April 2. The railroad will be into Porcupine by July 2.

The Burns and Goad claims in the Redstone section have been taken over on a long option by Mr. C. R. Poe, of Chicago, but the vendors have already received ten per cent. of the purchase price—about $100,000.

The Ellis Foster properties, the option on which was thrown up by the Hudson Bay Company of Cobalt, have now been taken up by Colorado capitalists, of which Mr. P. W. McCaffery is the agent Work will be commenced at once.

Extensive sampling is being done on the Rochester veteran claim of the Porcupine Central.

J. J. Byrne and Jack Hollinger have staked claims at Hobon 250 miles west of Sudbury, near the point where the Algom

Central meets the Canadian Pacific. Reliable prospectors say the new field looks good. Free gold has been found in big quartz veins.

Excellent time is being made on the Heinze property, the West Dome. The shot drills are being put down at the rate of 14 feet a day. Three shafts will be sunk under contract on the Pearl Lake Gold Mines claims, each shaft to be put down a hundred feet.

At the annual meeting of the Miller Porcupine Gold Mines it was decided to sink three shafts to the 100-foot level on the vein. The directors elected were Alex Miller, president; A. J. Murphy, J. Willocks, J. Arthur Griffith, and George Bannerman, directors.

Work at the 200-foot level of the Hollinger continues to reveal fine ore bodies. At the 200-foot level there is a vein of quartz ten feet wide apparently every whit as spectacular as at the hundred foot.

A two-stamp mill has been ordered for the Preston East Dome, but it will not be delivered until the railroad gets in. A small boiler and hoist are on their way into the property.

It is stated that the average assay from the cores on the Ross property have run $14.10. The dike upon which the diamond drill has been working runs uninterruptedly for several claims.

Mr A. G. Kirby, manager of the Nova Scotia Cobalt, has also been appointed general manager of the Moneta Gold Mines in Porcupine. This company has been organized with a capital of $2,000,000, half of which will remain in the treasury and the remainder be sold to the public. The president of the company is Sir Henry Pellatt.

The syndicate represented by the Bewick, Moreing & Company house has bought a considerable block of Hollinger stock though the control of the company still remains with the original syndicate.

ALBERTA.

Conference of Coal Mine Operators and Miners' Representatives.

The agreements between the coal mine operators and the miners being about to expire (on March 31) a conference of the parties concerned was called to discuss the terms of a new agreement. This conference was opened at Calgary, Alberta, on March 1st.

Western Coal Operators' Association.

Prior to the date the conference was called for, there was a meeting of the Western Coal Operators' Association, which includes the following coal mining companies (in alphabetical order):

Operating in Alberta:—

- Alberta Railway & Irrigation Co. (Galt Colliery) Lethbridge.
- Bankhead Mines, Ltd., Bankhead, near Banff.
- Canadian Coal Consolidated, Ltd., Frank.
- Chinook Coal Co., Lethbridge.
- Davenport Coal Co., Burmis.
- Diamond Coal Co., Diamond City.
- Hillcrest Coal & Coke Co., Ltd., Hillcrest.
- H. W. McNeill Co., Ltd., Canmore.
- International Coal & Coke Co., Ltd., Coleman.
- Leitch Collieries, Ltd., Passburg.
- Maple Leaf Coal Co., Bellevue.
- Royal Collieries, Ltd., Lethbridge.
- West Canadian Collieries, Ltd., Blairmore.

Operating in British Columbia:

- Corbin Coal & Coke Co., Corbin, Crow's Nest district.
- Crow's Nest Pass Coal Co., Fernie, Crow's Nest district.
- Hosmer Mines, Ltd., Hosmer, Crow's Nest district.

The Operators' Association elected the following officers: President, Lewis Stockett, Bankhead (re-elected); Vice-President, P. L. Jaismith, Lethbridge; Secretary-Treasurer, W. F. Little, Canmore.

District 18, U. M. W. of A.

District 18, United Mine Workers of America, has twenty-five locals, four of which are in the Crow's Nest district of British Columbia and the remainder in Alberta. W. B. Powell is president; C. Stubbs, vice-president, and A. J. Carter, secretary-treasurer. The Locals in British Columbia are at Corbin, Fernie, Hosmer, and Michel; those in Alberta are at Bankhead, Beaver Creek, Bellevue, Blairmore, Burmis, Canmore, Coleman, Carbondale, Cardiff, Diamond City, Edmonton, Frank, Hillcrest, Lethbridge, Lille, Maple Leaf (Bellevue), Monarch Mine (Elcan)), Passburg, Royal Collieries (Lethbridge), and Taber (two). The membership of District 18 on January 1, 1910, was 4,976; on January 1, 1911, it was 5,827. Its disbursements in 1910 were as follows: Officers' salaries and expenses, $5,009.75; relief, $15,087.99; "District Ledger," $14,654.90; law costs, $4,910.50; printing, $1,011.38; all other expenses, $10,530.37; total, $52,104.90.

Opening of the Conference.

The conference was opened, as already stated, on March 1. Lewis Stockett announced the names of the companies comprising the Western Coal Operators' Association, representatives of most of these being present. Beside the district representatives of the U. M. W. of A., there were present W. Rogers and Chas. Garner, both members of the International body of the U. M. W. of A.

The following were appointed a Scale Committee: For the operators, James Ashworth, R. W. Coulthard, W. F. McNeill, L. Stockett, and O. E. S. Whiteside; for the miners, A. J. Carter, J. O. Jones, W. Lees, D. McNabb, W. B. Powell, J. E. Smith, and C. Stubbs.

It was arranged that suggestions from the miners be submitted to the operators on Friday morning, March 3.

Proposals of Miners and Reply of Operators.

The miners' proposals were as follows:

1. The fixing of contract rate on all new work before the general agreement is discussed. This applies to all longwall work in No. 1 north, No. 1 south, No. 2, No. 3, No. 9, Coal Creek. Also to No. 3, Michel. Also to No. 8 south, Michel, the latter being in connection with new work. Also to longwall, Blairmore mines, Frank mines, Bankhead mines.

2. The elimination of inequalities in price paid through the district on timbering, and the contract mining rate at Michel mines Nos. 3, 4, 5, and 7. Also contract mining rates at Bear Valley, Lille, Lethbridge, A. R. and I., Royal Collieries, Canmore, and Hillcrest.

3. The adoption of general provisions of the agreement as a basis of negotiations, with amendments to be introduced as the clauses are dealt with and additions to be submitted.

4. The same day wage scale as is provided for in the agreement between the Montana Coal Operators' Association and District 27, U. M. W. of A., with proportionate advances on all work not covered by the agreement mentioned, the engineers and mechanics classified.

5. An advance of 5.55 per cent. on all contract and dead work after adjustments are made.

6. A uniform price list for supplies.

7. All agreements to expire on the 31st day of August, 1912.

Reply of operators:—

In reply to the suggestions of the representatives of District 18, U. M. W. of A., the Scale Committee of Western Coal Operators' Association would suggest:

1. In regard to the fixing of contract rates on all new work before the general agreement is reached. These prices are matters of concern under the old individual agreements, and are questions that this Scale Committee has no authority to act on, except for the making of rates to govern the same after March 31, 1911, and will have to come up in the ordinary course of the making of the agreement, and not having any special preference over other clauses or rates. We would suggest that all contract rates be dealt with in accordance with provisions that may be provided for in the new agreement.

2. The elimination of inequalities in prices, etc., is a matter that has not any special preference over other clauses, but must

be taken up in the ordinary course in the making of a new agreement.

3. We will accept the general provisions of the present agreement as a basis of negotiations, with such amendments as may be agreed to.

4. We cannot accept the Montana scale of wages for the reason that the conditions and hours are not the same.

5. The mining rates of this district are already very high, and the present market price of coal will not permit of general increase.

6. We agree to a uniform list for supplies as far as possible.

7. We see no reason for changing the date of the expiration of the agreement, and suggest that next agreement expires March 31, 1914.

In view of the suggestion made in Section 3, we are now prepared to take up the general provisions of the present agreement clause by clause.

Check-Off Clause Bars Progress.

The proceedings of several days following the reply of the operators to the foregoing proposals of the miners are shown in the following despatch from Calgary to the District Ledger, Fernie, under date Calgary, March 9. An introductory note reads: "Any press reports that differ in substance from this despatch are inaccurate." The despatch follows:

"Both parties have been occupied since Saturday, 4th inst., in an effort to arrive at some understanding with regard to the check-off clause, which, of necessity, practically interprets the question of closed shop or otherwise.

"Operators insist on elimination from agreement of any clause that makes or tends to make it of a closed shop nature, and insist on renewal of the discrimination clause at present in force to apply to the whole of the operators. On Monday a sub-committee was appointed consisting of A. J. Carter, C. Stubbs, L. Stockett, and W. F. McNeill, to discuss the matter to see if some understanding could be arrived at. Miners have insisted from the first on retaining with the Crow's Nest Pass Coal Company and the Frank and Corbin Coal Companies, the check-off clauses, which are at present in force with these companies, failing the acceptance of a similar clause to govern the whole of the Western Coal Operators' Association. Later on the miners' representatives submitted a general clause to cover whole of mines comprised in Operators' Association, this latter providing for irrevocable check-off forms being signed by all workers, and the local secretaries to examine register of employees. Operators state that this tends to closed shop and will not entertain same. Both sides insistent and discussion of other portions of agreement tied up pending settlement of this question.

"Full conference re-convened this morning, when sub-committee reported that after careful deliberation they were unable to recommend any action for the joint committee. The conference was thereupon adjourned to March 20th inst."

In brief explanation of the foregoing, it may be mentioned that under the check-off system, all workers, whether members of the union or not, are required, before commencing work with the company employing them, to sign a form authorizing the deduction from their wages of the dues of the local union. This enables the union to make use of the company as a means of supplying information relative to all men it employs and for collecting dues from the men. The three companies above-mentioned as having granted the check-off system in the past did not join with the Operators' Association at the time of its making its last agreement with the U. M. W. of A., but made individual agreements. In the spring and summer of 1909 there was a long fight over the closed shop question, but the Operators' Association remained firm, keeping the various mines represented by its members idle until eventually its contention for open shop was agreed to on behalf of the miners.

ENFORCING COAL MINES REGULATION ACT IN ALBERTA

Contraventions of the Coal Mines Regulation Act of the Province of Alberta have led to prosecutions, with the consequences stated below:

W. P. Williams, manager of the Lille colliery of the West Canadian Collieries, Ltd., was fined $40 for employing to act as a fire boss a man who did not possess the necessary certificate of competency; and John T. Griffiths, the man so employed, was fined $25.

— Pearson, a fire boss at the West Canadian Collieries, Ltd., Blairmore mine, was fined $5 for non-compliance with regulations in connection with shooting.

Geo. Darbyshire, of Burmis, was fined $10 and costs for having returned to his place in the mine after a shot had been fired and before the place had been examined by the fire boss. T. Tonge, the fire boss whose duty it was to have returned and examined the place before operations were resumed in it, was fined $20 and costs for having failed to do so.

Thomas Rawson, a fire boss, was charged with handing matches to miners for them to fire their own shots, but was dismissed owing to the papers in connection with his prosecution having been irregularly made out.

The District Ledger, the United Mine Workers of America newspaper published at Fernie, B.C., made the following comment: "The above cases were all prosecuted at the instigation of J. T. Stirling, Provincial Inspector of Mines, and we hope that the experience of these law-breakers will have a deterrent effect upon others, but if not and they are discovered, that the punishment meted out will be more severe, as it is imperative that mining, hazardous even under normal conditions, should not be knowingly made more so by wilful disregard of laws and common sense."

On March 5th the fire bosses employed in coal mines in western Alberta met for the purpose of forming an organization for mutual aid and benefit, inasmuch as they are not eligible for membership in the United Mine Workers of America. After discussion organization was effected, and the following officers were appointed: T. Bradley, Hillcrest, president; J. Finlayson, Frank, vice-president; R. Ridley, Blairmore, secretary-treasurer.

BRITISH COLUMBIA.

It is singular what little regard for facts some men have. A recent case was that of the publication in a British Columbia daily newspaper of "A Page for the Wage-Worker," from which the two excerpts printed below have been made. The first one ran thus: "Through the fighting proclivities of Messrs. Hawthornthwaite and Williams, Socialist members of the British Columbia Legislature, the Coal Mines Regulation Act has been amended to meet the approval of the miners. Strict enforcement is all that is needed to make the legislation along these lines the best in the world." This comment is in strong contrast to that of one of the supporters of the Provincial Government who, when the bill was before the House, most emphatically condemned the two Socialist members named, each representing a coal mining constituency, for having abstained entirely from joining with the miners in giving to the Deputy Minister of Mines and the Chief Inspector of Mines, information that would be helpful in making the bill thoroughly useful and effective in securing the safe working of the coal mines of the Province, as far as could be done by legislation. Several amendments of minor importance offered by these Socialist members when the bill was before the House were accepted by the Government, but practically every important change in the Act was made by the Government after conference between its officials and miners at the mines, all the coal-producing districts of the Province having first been visited by the officials for the express purpose of ascertaining the views of both mine operators and miners before completing the bill for submission to the local Legislature.

The second excerpt follows: "The coal miners of Michel, B.C. have decided to no longer accept the reports of Government appointed inspectors as to the presence of gas in the workings. Recent fatalities in Alberta, nearby, have aroused a determination on the part of the miners to either have inspectors of their own or cease work wherever it is felt dangerous to enter the mines. The

outcome of such action will probably force the Government to accede to the request of the Socialist members of the House.'' Well, not only did the Government persist in its refusal to permit the coal mine inspectors to be appointed by the miners, but the secretary of the local miners' union at Michel sent to several newspapers, for publication, his distinct denial that the miners there objected to the Government mine inspectors; on the contrary, he wrote that the men had every confidence in those officials. Their stated grievance, to secure the remedying of which they stopped work for a few days, was in connection with the running of the ventilating fans, and the company made an improvement in this connection, and in other ways met the claim of the miners for arrangements they considered necessary for their protection when working in the mines. Further, the inspectors of the local mines at Michel, which is in British Columbia, have absolutely nothing to do with mines in Alberta, the latter province having its own laws and regulations, so that if there has been any laxity in observing them the British Columbia officials are entirely free from blame, since they have no jurisdiction outside of this province. No doubt this is known to the more intelligent of the English-speaking or English-reading miners, but to those who are ignorant or illiterate it may not be known, hence the cunning of writers of such mis-statements.

Slocan—A syndicate of men interested in restoring to Kaslo the commercial advantages that accompanied the operation of the Kaslo & Slocan Railway prior to the destruction by fire last summer of a number of railway bridges and trestles between McGuigan and Sproule's, has been negotiating with the Provincial Government with the object of obtaining from this source substantial monetary aid essential to the renewal and repair of the damaged parts of the railway, and for ore-shipping facilities at Kaslo, but at the time of writing nothing definite has resulted. The syndicate has offered to buy the railway from the Great Northern Railway Company for a comparatively small sum, and to operate it after putting it in working order, so as to provide transportation facilities for mining properties from McGuigan to Kaslo, these including the Rambler-Cariboo, Lucky Jim, Whitewater group, Utica, and other mines about McGuigan basin and Whitewater camp, and as well for a number of properties situated up the south fork of Kaslo Creek, which have waggon road connection with the railway seven or eight miles from Kaslo. It is thought that if nothing comes of present negotiations, there will be but little chance of the railway being operated again, at any rate for several years.

The only mine in the part of Slocan district affected by the stoppage of traffic on the K. & S. Railway that has been shipping ore this year, notwithstanding existing unfavourable conditions, is the Rambler-Cariboo, but now that the snow is melting the road between the mine and Three Forks, on the C. P. R. Company's line from Sandon to Nakusp, via Slocan Lake, much heavy hauling can not be done. By the middle of March about 600 tons of ore had been received at the Trail smeltery from the Rambler-Cariboo, which was nearly as large a quantity as was received from that mine during the whole of 1910, the damage done by last summer's forest fires having prevented shipment during the greater part of the latter half of the year.

In other parts of Slocan district progress is being made, with mining activity around Sandon, New Denver, and Silverton. Only two mines are maintaining a substantial production, namely, the Richmond-Eureka and the Standard, though several others are expected to make a fairly large output of ore later in the year. It is probable the Standard will add considerably to its tonnage during the latter half of the current year, for it has lately been announced that a concentrating mill is to be erected and equipped, a compressor plant put in for machine drill and general power purposes at the mine, and an aerial tramway constructed from mine to mill. Meanwhile development work is being continued in adits Nos. 5 and 6, and large bodies of ore are being opened ready for extraction. Mention was made last month of progress being made with the work of equipping the Van Roi mill, situated higher up Four-Mile Creek than the Standard; also, of the Hewitt-Lorna Doone group, owned by the Silverton Mines, Ltd., and having much ore available for stoping.

Rossland—The output tonnage of this camp for the first quarter of the year may be placed at about 55,000 tons of ore shipped crude to the smeltery, and approximately 2,000 tons of low-grade ore concentrated at a local plant. The Consolidated Mining & Smelting Company's Centre Star group has produced nearly two-thirds of this quantity, with the mines of Le Roi No. 2, Ltd., next in tonnage, and then Le Roi. The production of the last-mentioned mine during the three months has totalled more than 3,000 tons.

The exploration of properties in the south belt of this camp has recently again been urged, and a proposal made that, say 20 men should each subscribe $500, the $10,000 to be thus obtained to be used in a systematic search for ore, and its development if found, the company to be a development company only, exploring properties held under lease and option of purchase, and, in the event of success, the proved property to be disposed of to capitalists to be worked on a larger scale. No steps have yet been taken to carry this proposal into effect, but it is being discussed in the camp and its feasibility being considered.

Coast—Reports received from Portland Canal district about the middle of March indicate that the season may be expected to be favourable to a resumption of mining operations earlier this year than last. The snow is said to be melting quickly and as a consequence it is thought probable work will be resumed a month earlier than in the spring of 1910. There has not been much information published lately relative to the work done during the winter on the few properties where a suspension was not necessary. The most cheering news to those interested in the progress of the camp was that relative to the first shipment in considerable bulk from a local mine, the Portland Canal Mining Company having sent down to Stewart between 400 and 500 tons of iron concentrate, containing value in gold. This shipment was consigned to the Tyee Copper Company's smelting works at Ladysmith, Vancouver Island. The silver-lead concentrate produced by the company's concentrator is to be shipped to the smeltery at Tacoma, Washington, U.S.A.

GENERAL MINING NEWS.

NOVA SCOTIA.

Halifax, N.S., March 17.—Controlling interest in the tungsten mine located at Scheelite, near Moose River, Guysboro County, has been sold by A. A. Hayward to a syndicate composed of prominent Canadians. The price for the interest is about a quarter million dollars, and outside of the coal mines is the biggest ever made in Nova Scotia.

Sydney, March 17.—A mining deal has been completed here within the past week, whereby the property of the Colonial Coal Company, whose areas are situated at Little Bras d'Or has been purchased by a company of American and English capitalists, who will operate the colliery. The price said to have been paid was $200,000. W. A. MacKay retains an interest in the new concern, and it is known that there are several other prominent local men interested. The new company will make a number of improvements to the equipment of the colliery, and a busy summer is anticipated in that district.

QUEBEC.

Montreal.—It was rumoured to-day that Mr. J. N. Greenshields and associates have secured options on some of the biggest producing asbestos mines in Russia.

It is stated in the same connection that Mr. Slade, of the Black Lake Company is in Russia looking over the situation on behalf of Mr. Greenshields.

In a measure the Russian properties, though of low grade ore, were responsible for the flooding of the markets in 1909-10 and the present negotiations no doubt are with a view of adjusting the supply of raw material to the advantage of all concerned.

ONTARIO.

Toronto, March 18.—As expected, the Ontario Government has come to the aid of Little Nipissing Silver Cobalt Mining Company. On motion of Hon. W. J. Hanna, the rules were yesterday suspended to allow the introduction of a bill to authorize the company to take the necessary steps with regard to capitalization to cover issue of six hundred thousand stock.

Porcupine, Ont., March 18—In point of development the Vipond, or under its chartered company name, the Porcupine Gold Mines, ranks next to the Dome and the Hollinger. A month ago the Vipond cut the No. 2 vein at the 100-foot level, which, on the surface, has been stripped for 200 feet and shows an ore body 160 feet long.

Kenora, March 11.—An interesting mining case was heard on Thursday and Friday at Kenora, before S. Price, of St. Thomas, mining commissioner for Ontario. The case hinged on four iron claims which were acquired at different times, and in which several local parties have interests, situated near Dinorwic. The properties were taken up some years ago, originally, and it was only when an endeavour to establish a title was made by one interested party some months ago it was discovered that the other owners had not parted with their interests or were not willing to dispose of them. All the various interests were represented by lawyers, with the exception of E. R. Reese, of Winnipeg, who, while not actually interested, is stated to have the iron claims now in question under option of purchase.

No decision was given by Commissioner Price at the time, as, owing to the mass of evidence produced, it will require some considerable time to go over the record. However, it is likely that his decision will be rendered within a week or so.

BRITISH COLUMBIA.

Nelson.—That there is sufficient ore ready to be taken out of the workings of the Nugget mine to keep the mill in operation during the three months of April, May, and June, when the melting of the snow causes trouble with water and makes operation difficult, was the statement made by W. B. Pool, manager of that well known Sheep Creek property, last night. Mr. Pool came in with a brick, the product of one month's run of the mill, which assays in the neighbourhood of $5,000.

Silverton.—The new concentrator that has been erected in connection with the Van Roi silver-lead mine has been completed, and has started operations. The last piece of machinery has arrived at the mine and the plant has been started. The necessity for the new concentrator arose from the impossibility of the Van Roi Mining Company securing another long term lease of the Wakefield mill, which it has operated in the past, including last year.

Vancouver, B.C., March 15.—If negotiations now under way are carried out the Vancouver exhibition will this year have one of the finest and most attractive mining and mineral exhibits ever made in the Dominion. The management is taking special action on this line and aims to present an exhibit which shows all phases of the work. At a meeting of the board of control of the association yesterday, H. B. Brown, owner of the Bulldog mine at Hedley, discussed the matter with the managers. He said one of the chief difficulties would be the shipment of ores from the mines to the grounds, but laid before the managers plans for securing an extensive exhibit of minerals as well as the installation of a working stamp mill. After discussion Manager Rolston was instructed to take the subject up with mining companies and endeavour to arrange for a mineral exhibit which would adequately represent the interests.

COMPANY NOTES

Western Coal & Coke Company.

The annual report of the Western Coal & Coke Company contains a statement by E. B. Greenshields, president, and Charles Fergie, managing director. The latter's statement refers to the physical part of the company. Mr. Greenshields' report is in part:

For the past year the attention of the directors has been given to the developing work, and proving the reserves of coal. The main entries are four thousand feet in coal, and the main hoisting slopes are down over one thousand feet, where the coal has been found in fine quality and in regular ground. The seam of coal has been opened up on each side of the Beaver Creek valley, giving two entries into the coal. The result of the work this year shows that the physical condition of the property is even better than anticipated, and the coal reserves greater than estimated, and the directors are very much pleased to be able to state that the mine is now in a position to ship coal in paying quantities. The report received this week from the superintendent is that everything at the mine is in a very satisfactory state, and he expects by this fall to be able to ship one thousand tons of coal a day. As you are already aware, the coal has been thoroughly tested on the Canadian Pacific Railway with most satisfactory results and its coking quality has also been proved.

Your directors have made arrangements to have the railway built this summer to connect the mine with the Canadian Pacific Railway at Pincher.

A careful survey has been made of the ground, and a good route chosen which shortens the distance to 13 miles. The road will be built by a separate company, but this will be controlled by the Western Coal & Coke Company.

The difficulties that have been met with in the past history of the company seem at last to have been overcome, and the present prospect is bright with the promise of the successful operation of the mine in the near future, and of its being a large producer and shipper of the best quality of bituminous coal.

La Rose Dividend.

The directors of La Rose have declared the regular quarterly dividend of 2 per cent., payable April 20, to shareholders of record March 31. Books close April 1.

STATISTICS AND RETURNS

COBALT ORE SHIPMENTS.

Following are the shipments from the Cobalt camp for the week ending March 17, and those from Jan. 1, 1911, to date:

	Mar. 17. Ore in lbs.	Since Jan.1. Ore in lbs.
Barber	....	6,000
Beaver	....	551,513
Buffalo	....	551,513
Chambers-Ferland	....	256,900
City of Cobalt	66,000	252,280
Cobalt Lake	61,420	1,146,990
Cobalt Townsite	.....	289,740
Coniagas	69,400	934,180
Crown Reserve	65,000	508,670
Hargraves	.....	41,100
Hudson Bay	.....	122,350
La Rose	61,200	1,105,720
Kerr Lake	.....	721,592
King Edward	.....	40,000
McKinley-Darragh	65,190	1,312,940
Nipissing	.....	1,606,240
O'Brien	.....	271,320
Peterson Lake (Little Nip)	.....	58,430
Right of Way	.....	318,260
Silver Cliff	.....	98,180
Standard Cobalt	.....	44,813
Temiskaming	.....	363,419
Trethewey	48,100	229,700
Wettlaufer	.....	60,022

The shipments for the week were 436,310 pounds, or 218 tons.

The shipments from Jan. 1 to March 17 were 10,897,470 pounds, or 5,448 tons.

BRITISH COLUMBIA ORE SHIPMENTS.

The following are the figures of the ore production and movement for the week ending March 18, and for the year to date:

BOUNDARY SHIPMENTS.

Granby	25,601	237,868
Mother Lode	8,400	67,599
Snowshoe	1,868	22,338
Rawhide	112	33,052
Jack Pot	1,520	6,826
Number Seven	49	612
Other mines	.....	2,377
Total	37,547	370,672

ROSSLAND SHIPMENTS.

Centre Star	2,971	36,947
Le Roi No. 2,	420	5,106
Le Roi No. 2, milled	300	3,300
Le Roi	63	2,878
Other mines	.....	217
Total	3,754	48,448

SLOCAN-KOOTENAY SHIPMENTS.

Sullivan	1,021	7,343
St. Eugene, milled	2,775	30,525
Richmond-Eureka	57	614
Ruth	70	235
Rambler-Cariboo	70	646
Queen, milled	420	4,410
Granite-Poorman, milled	250	2,750
Nugget, milled	110	1,210
Wilcox, milled	75	825

The total receipts at the smelters for the week, including concentrates, were 42,898 tons, and for the year to date, 431,104 tons.

TORONTO MARKETS.

March 24—(Quotations from Canada Metal Co., Toronto):

Spelter, 5.50 cents per lb.
Lead, 3.65 cents per lb.
Antimony, 8 to 9 cents per lb.
Tin, 43 cents per lb.
Copper, casting, 13 cents per lb.
Electrolytic, 13 cents per lb.
Ingot brass, 8 to 12 cents per lb.

March 24.—Pig Iron (Quotations from Drummond, McCall Co., Toronto):

Summerlee No. 1, $23.00 (f.o.b. Toronto).

Summerlee No. 2, $22.50 (f.o.b. Toronto).
Midland No. 1, $19.50 (f.o.b. Toronto).
Midland No. 2, $19.00, (f.o.b. Toronto).
Hamilton No. 1, $18.00 (f.o.b. Hamilton).
Hamilton No. 2, $17.50 (f.o.b. Hamilton).
Clarence, $19.00 (f.o.b. Toronto).
Cleveland, $19.00 (f.o.b. Toronto).

GENERAL MARKETS.

Coal, anthracite, $5.50 to $6.75.
Coal, bituminous, $3.50 to $4.50 for 1¼-inch lump.

Coke.

March 21.—Connellsville Coke (f.o.b. ovens).
Furnace Coke, prompt, $1.60 to $1.65 per ton.
Foundry Coke, prompt, $2.00 to $2.15 per ton.
March 21.—Tin (Straits), 41.00 cents.
Copper, Prime Lake, 12.50 cents.
Electrolytic copper, 12.25 cents.
Copper wire, 14.00 cents.
Lead, 4.45 cents.
Spelter, 5.65 cents.
Sheet zinc (f.o.b. smelter), 7.50 cents.
Antimony, Cookson's, 9.50 cents.
Aluminium, 21.00 to 21.50 cents.
Nickel, 40.00 to 45.00 cents.
Platinum, ordinary, 41.50 per ounce.
Platinum, hard, $43.50 per ounce.
Bismuth, $2.00 to $2.10 per lb.
Quicksilver, $52 per 75-lb. flask.

Prompt and Satisfactory Returns

The North American Life is continually receiving from policyholders unsolicited letters like the following, expressive of their appreciation of the treatment accorded them and results attained:

The holder of Policy No 8192 wrote:—
"I appreciate the promptness with which you have remitted the amount due me. I may say that I have nothing but praise for your company for the very satisfactory way in which I have always been treated. Our business relations have been very pleasant and I wish the North American Life the future success it so well merits."

The holder of Policy No. 9205 said:—
"I cannot close matters with the company without expressing my great appreciation of its methods and the very fine manner in which I have been treated by its representatives. In the 20 years of dealing I can recall no single instance in which I have received anything but courtesy and business promptness. I hope to renew relations with the North American soon in respect to my children's insurance."

The Financial Position of the Company is Unexcelled.

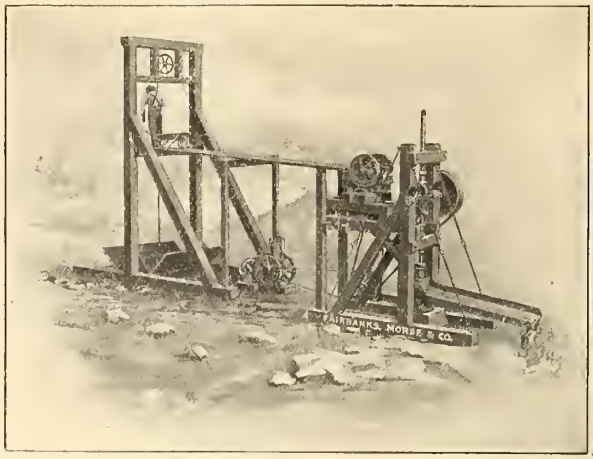
Prospector's Outfit

Fitted with NISSEN STAMP MILL



Nissen Mortar

A Boon to Prospectors

A simple, compact outfit, sturdy in construction and which is easily taken apart for transportation purposes. One man and a supply of gasoline is all that is necessary to operate the outfit.

It is fitted with a Fairbanks-Morse Gasoline Engine, which cannot be equalled for reliable continuous service. The stamp mill is a modern Nissen Stamp—the mill with largest capacity and smallest consumption of Power. Our Bulletin will tell you all about it. Send for it to-day.

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

DEPARTMENT OF MINES. GEOLOGICAL SURVEY.

PUBLICATIONS

The Geological Survey has published maps and reports dealing with a large part of Canada, with many local areas and special subjects.

A catalogue of publications will be sent free to any applicant. A single copy of a map or report that is specially desired will be sent to a Canadian applicant free of cost and to others at a nominal price. The applicant should state definately the precise area concerning which information is desired, and it is often of assistance in filling an order for a map or report if he states the use for which it is required.

Most of the older reports are out of print, but they may usually be found in public libraries, libraries of the Canadian Mining Institute, etc.

REPORTS RECENTLY ISSUED:

CANADA

1085. Descriptive Sketch of the Geology and Economic Minerals of Canada. Accompanied by a geological and mineral map of Canada, by G. A. Young and R. W. Brock.

NEW BRUNSWICK and NOVA SCOTIA

1107. Joint Report on the Bituminous or Oil Shales of New Brunswick and Nova Scotia. Also on the Oil Shale Industry of Scotland Part I, Economics, Part II, Geology by R. W. Ells.

QUEBEC

1077. Memoir No. 7, Geology of St. Bruno Mountain, Quebec, with maps, by J. A. Dresser.

ONTARIO

1059. A Geological Reconnaissance of the region traversed by the National Transcontinental railway between Lake Nipigon and Clay Lake, Ontario. Accompanied by two maps covering the region, by W. H. Collins.
1082. Memoir No. 6. Geology of the Haliburton and Bancroft Areas, Ontario, by Frank D. Adams and Alfred E. Barlow.
1091. Memoir No. 1, Geology of the Nipigon Basin, Ontario, by A. W. G. Wilson.

NORTH WEST PROVINCES

1035. Coal Fields of Manitoba, Saskatchewan, Alberta and Eastern British Columbia accompanied by a map, by D. B. Dowling.
1115. Memoir No. 8. The Edmonton Coal Field, Alberta, with maps, by D. B. Dowling.

BRITISH COLUMBIA

1093. Memoir No. 2. Geology and Ore Deposits of Hedley Mining District with maps, by Charles Camsell.
1139. Memoir 11-T Triangulation and Spirit Levelling of Vancouver Island, 1909, by R. H. Chapman.

YUKON and NORTH WEST TERRITORIES

1101. Memoir No. 5. Lewes and Nordenskiold Rivers Coal District, Yukon Territory, by D. D. Cairnes.
1080. Report on a part of the North West Territories drained by the Winisk and Attawapiskat Rivers, by Wm. McInnes.
1006. Report on a traverse through the southern part of the North West Territories from Lac Seul to Cat Lake in 1902, by A. W. G. Wilson.

MAPS RECENTLY ISSUED:

CANADA

1042. Mineral Map of Canada. Scale 100 miles to 1 inch.
1084. Geological Map of Canada. Scale 100 miles to 1 inch.

NOVA SCOTIA

1019. City of Halifax Sheet. Scale 1 mile to 1 inch.
1134. Map 14 A. Hall Harbour Sheet. Scale 1 mile to 1 inch.

QUEBEC

1112. Map 12 A. Vicinity of the Transcontinental Railway, Abitibi District, Quebec. Scale 4 miles to 1 inch.

ONTARIO

1091. Map 8 A, Lake Nipigon, Thunder Bay District, Ontario. Scale 4 miles to 1 inch.

ALBERTA

1132. Map No. 7A. Bighorn Coal Area, Alberta, by G. Malloch. Scale 2 miles to 1 in.
1117. Map 5A. Topographical map of Edmonton, scale 2,640 feet to 1 inch.
1118. Map 6A. Edmonton. Isobathic lines showing cover over "Clover Bar" coal seam, scale 2640 feet to 1 inch.

BRITISH COLUMBIA

1068. Geological Map (sketch) of the Sheep Creek Mining Camp, West Kootenay, B.C. Scale 1 mile to 1 inch.
1095. Map 1A. Topographical map of Hedley Mining District, Scale 1000 feet to 1 inch.
1096. Map 2A. Geological Map of Hedley Mining District. Scale 1000 feet to 1 inch.

YUKON and NORTH WEST TERRITORIES

1089. Map 9A. Explored Routes on Parts of the Albany, Severn and Winisk Rivers. Scale 8 miles to 1 inch.
1103. Map 10A. Tantalus Coal Area, Yukon Territory. Scale 2 miles to 1 inch.
1104. Map 11A. Braeburn-Kynocks Coal Area, Yukon Territory. Scale 2 miles to 1 inch.

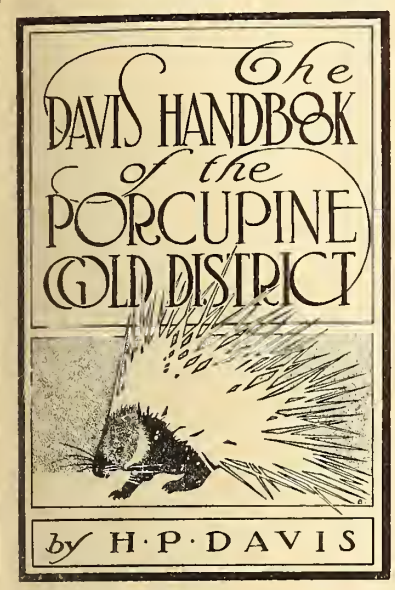
NOTE.—Maps published within the last two years may be had, printed on linen for field use. A charge of 10 cents is made for maps on linen.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon. Letters and samples that are of a Departmental nature, addressed to the Director may be mailed O.H.M.S. free of postage.

Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.

IN PREPARATION

THE DAVIS HANDBOOK



OF THE Porcupine Gold District

THIS BOOK WILL INCLUDE:

A.—An accurate and up-to-date map of the Porcupine Gold District.

B.—A brief review of the discovery and development of the Northern Ontario mining districts, including an analysis of the production and dividends of the Cobalt camp to December 31, 1910.

C.—A historical sketch of the discovery and early development of the Porcupine Gold Fields.

D.—An outline of the geology of the Porcupine area.

E.—A description of the important properties so far developed.

F.—A directory of the incorporated companies, giving the date and place of corporation, the head office, transfer office, capital authorized and issued, officers and directors, the location and area of the property, equipment, development, etc.

This book will be illustrated with many photographs and drawings, and will be printed on high grade paper with heavy paper or cloth covers. The first edition will consist of 5,000 copies.

Companies and syndicates operating in the Porcupine Gold District are requested to send full information to the publisher. Blank forms will be furnished on application.

Orders sent to H. P. DAVIS, 25 Broad Street, New York, will be filed and notifications will be sent when book is ready for distribution.

Price, Paper Cover, $1.00, Including Map. Price, Cloth Cover, $1.50, Including Map

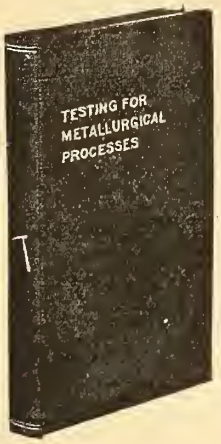
Testing for Metallurgical Processes



By JAMES A. BARR

216 pages
Illustrated
Indexed

$2 POSTPAID

This book is designed to assist in the selection of the process of treatment for any ore. The author describes the apparatus employed in making laboratory and small-lot tests. It is founded upon experimental work at the Michigan College of Mines, and the methods recommended have been tested in practice. It is brief and practical, equally valuable to the student and the practicing engineer.

A. T. LAING.

PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are: Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows:

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unsurveyed territory, is open to prospecting.

Miners' Certificates good for a calendar year may be obtained by sending $10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minimum being 40 acres in unsurveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of $10.00 plus a yearly rental of $1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed territory may be purchased as a mining concession at the price of $20.00 per acre if within 20 miles of a railway in a straight line, or $10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

The Hon. Minister of Colonization, Mines and Fisheries.
Quebec.

Copies of the Mining Law and any information can be had on application to

The Hon. Christopher Chisholm

Commissioner Public Works and Mines, - - HALIFAX, NOVA SCOTIA

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals, extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native orm; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The silver mines of the Cobalt district have astonished the world by their richness, and promising gold discoveries have recently been made in Porcupine Lake.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver, $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals, or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,57[illegible], the Lead Output 52,408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

MINING SCIENTIFIC PRESS

Controlled by T. A. Rickard — **Established 1860** — H. Foster Bain, Editor — **Published weekly** — Thomas T. Read, Associate Editor

In every issue valuable articles are published on mining, metallurgy, and geology, the latest news from special correspondents at the principal mining centers, letters giving the ideas and experience of successful men, and other items of useful knowledge.

THE MINING MAGAZINE
Established September, 1909

A. RICKARD, Editor — **Published monthly at London, England**

A monthly magazine is the natural corollary of a technical weekly. It permits of more deliberate and more extended notice of matters concerning which the news element is less important.

The Mining Magazine includes a review of the world's progress in mining, metallurgy, and economic geology, written by men who have personal knowledge of the regions and conditions discussed.

(Gold, Diamond, Silver, Copper, Tin, Iron, and other Mines, Collieries, Land, Exploration and Mining Investment Concerns, &c.)

Arranged in three sections—

Australasian, African, Miscellaneous,

Preceded by Tables of Crushings and followed by lists of Mining

DIRECTORS, SECRETARIES, MINING and CONSULTING ENGINEERS and MINE MANAGERS.

Their Names, Addresses, and Descriptions, and Names of the Companies with which they are connected, and a

DICTIONARY OF MINING AND OTHER TERMS.

THE MINING MANUAL for 1910 contains particulars of over 3,120 Companies arranged in three sections, 315 Companies being AUSTRALASIAN (including Western Australia, Queensland, Broken Hill, Deep Leads, New Zealand and Tasmania); 985 AFRICAN (including Transvaal, Rhodesia, Cape Colony, Natal, West Africa, Nigeria, &c.); and 1,820 MISCELLANEOUS (including Mexico, India, America, Europe, Siberia, &c., and the Coal, Iron, Tin and other Mining concerns of the United Kingdom). The particulars given of each Company include the Directors and other officials; date of establishment; seat of operations; description of the property, with the purchase consideration; plant erected or in course of erection; present working results; ore reserves; details of capital; calls; dividends paid; and the financial position as disclosed by the accounts. Highest and lowest prices of the shares for the last four years, also latest price.

The Index, which forms a highly important feature of the book, contains the names of over 5,300 Companies, consequently active, private or dormant companies can easily be traced.

Crushing tables and Gold Outputs from the principal mines are given at the commencement of the volume, showing tons treated monthly, results obtained, and yield per ton; also annual yields.

Lists of Directors (8,000), Secretaries (1,900, Mining and Consulting Engineers and Mine Managers (1,400) include their addresses and descriptions and names of the Companies with which they are connected.

To be obtained from all Booksellers, or direct from the Proprietor,

WALTER R. SKINNER,

11-12, Clements Lane, London, E.C.

NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

"WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. **It does not freeze,** or rather, explodes with perfect efficiency when frozen **and needs no thawing.**

"AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appear ance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

PERMITTED EXPLOSIVES for Coal Mines

Nobel Monobel, Saxonite and Carbonite.

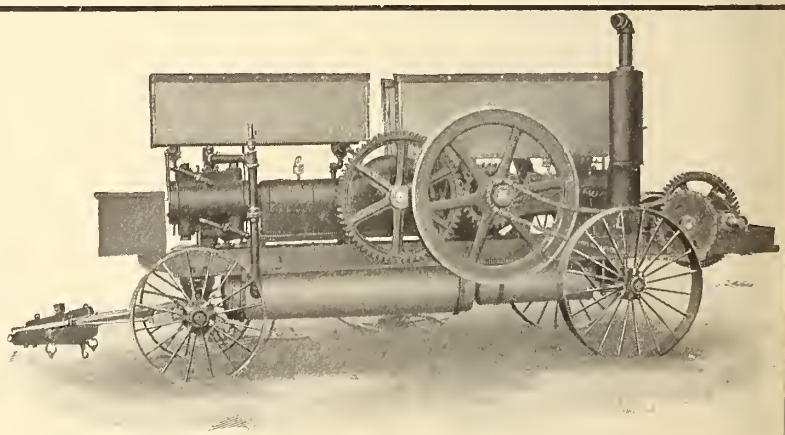
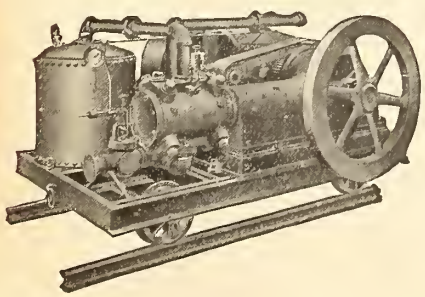
Take Along Some Air!

Air power, and the advantages it secures in drilling, coal cutting and other mining and construction work, can be secured at points remote from a power plant, by means of



Sullivan Portable Air Compressors



The class "WK-2" compressor, shown below, represents a **practical** and **economical** medium for drilling by electricity. It is complete with motor, receivers and chain drive, and is mounted on a steel truck. It will operate several hammer drills, a coal puncher or two, or a couple of rock drills.

The "WK-3" independent road outfit shown above is driven by a gasoline engine. It is useful for preliminary development in rough country, or for any mine or quarry purposes requiring a small quantity of air for short periods at different places. *"Ask for Bulletin 658F."*

Amatite ROOFING

"NEEDS NO PAINTING."

AMATITE means more to the man who needs a roofing than just merely something to put on the top of a building.

It means a thoroughly satisfactory and reliable roof covering, without future *expense for painting* — because the *real mineral surface* makes painting unnecessary.

Frequently the cost of painting a roofing amounts to almost enough to buy a new Amatite Roof.

Amatite can be laid right over shingles, tin or other ready roofings. The directions hold good for laying Amatite anywhere and over anything, and are as simple as A B C.

For further information, booklet, samples, etc., address nearest office.

Everjet Elastic Paint

A very tough, durable paint at a low price. One color only—lustrous black. Use it for machinery, heating apparatus, smokestacks, roofs, fences, water tanks, etc.

Creonoid Lice Destroyer and Cow Spray

Cows give more milk if sprayed with Creonoid to keep away the flies which make them restless. The poultry output will be increased if the hen house is made obnoxious to insect pests by disinfection with Creonoid.

RAND "B.C. 11"

HAMMER DRILLS

The Telescope Feed Hammer Drill is rapidly displacing the heavier types of piston drills for stopping and drilling all "up" holes. purely on the strength of their lighter weight simple and easy operation; saving in air consumption; saving of time in changing steels, changing positions and starting new holes; reducing labor costs and their adaptability to places difficult of access. If you have not seen the New "B.C. 11" or Butterfly type of drill you should write for our descriptive pamphlet at once.

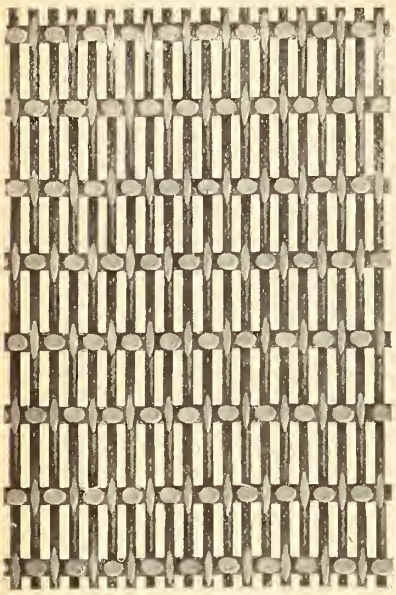
CORRESPONDENCE SOLICITED

THE BROWN MACHINE COMPANY, LIMITED

NEW GLASGOW — ENGINEERS — NOVA SCOTIA



A Cobalt Mine Superintendent

found recently that where one make of screen lasted 19 shifts of twelve hours, a Greening Rolled Slot Screen in the same place lasted 31 shifts of twelve hours. You do not need to do much figuring to see where a great deal of money can be saved by using

GREENING'S
Rolled Slot Screening

In this case, which is typical, the Greening Rolled Slot Screening gave 144 hours more service than the next best screen. This agreeable result comes from perfectly accurate construction and the use of a Special English High Carbon Wire. You would be greatly interested by our **Rolled Slot Catalog**

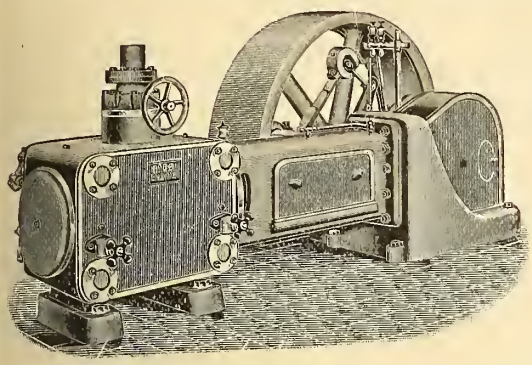
Robb Corliss Engines



Have the Armstrong-Corliss valve gear, which will operate at a higher speed than the ordinary releasing gear.

This valve gear does not depend on springs or dash pots for closing and runs without noise.

The wearing parts of the valve gear are enclosed in a casing and run in oil so that friction is reduced to a minimum.
